doesn't go in to dinner with the family, and this is a condition in which she must remain until Philip de Miraflore—now owner of the Château de Saint Léon, in Brittany—meets her by chance at Madame de Privoisin's and renews the love of eight years ago. The two marry, and in the third act they are found about to sit down to a *tête-à-tête* breakfast in the château garden—one of those open-air breakfasts at which the good little red wine seems so very good and the yard and a half of bread so relishing that all must be contentment. But this Summer in Eden—or Brittany—cannot be undisturbed. Philip and his wife entertain a stranger who is an enemy, unawares. He narrates at breakfast-time the story of Philip and Juan in Andalusia, and speaks as if the killing of Juan—of which Philip's wife knows nothing—had been a murder and not an act of self-defence. Left to themselves, Marie accuses Philip of want of confidence, if not of the graver wrong which the stranger would have her believe, and they are clearly estranged. An old servant, coming suddenly on the stranger, finds that his halting gait and feeble voice have left him, and while the stranger is in truth Juan, the servant thinks him Monsieur de Flamarens, and communicates that suspicion to Philip. Philip himself suspects his wife, and, in the fourth act, while pretending to leave her, he watches the movements of the stranger. The stranger—Juan—has gained entry to the boudoir, and declares himself to Philip's wife. Then enters Philip, Juan having just had time to retire to the oratory; and the husband charges the wife with the concealment of her lover. She answers that if he so far doubts her as to search the oratory, she, however innocent the search may prove her, will refuse to see him again. He loves her, of course, devotedly, and he will not search at such a cost; but he bethinks him of a story of Balzac's, which tells of how a husband built in a lover with bricks, and he calls the masons, and they begin to make their wall which shall shut up the oratory for ever. They have not built far when the lover comes forth to confront the husband. And it is Juan, and with a cry that has something of rage, but more of relief, Philip says "Thank God!" and is saved from the remorse that has racked him. Juan is not dead, then, and Marie is innocent.

On a drama avowing itself as "romantic," one does not bear very hardly for lack of probability; nay, one is minded to bear lightly on it when lack of probability is atoned for not only by many striking situations and strong scenes, but by dialogue that is pleasant to hear—never weak, often pointed, nervous, and terse. But it would be an unworthy treatment of Mr. Hamilton Aidé—whose novels of themselves prove him a literary artist—to pass over such faults as occur to one when witnessing his play. Marie, his heroine, as the *Pall Mall* has truly pointed out, is so faintly outlined that we hardly know at the end whether her love of her husband or her old fancy for Juan was the stronger. Perhaps it is hardly natural that she should have been allowed to remain in ignorance of what Philip believed to have been Juan's fate. Certainly it is not natural that in the third act she should be so strangely unsympathetic, and in the fourth so chary of her protests that when desiring to explain she allows herself to be silenced in a minute, and the masons begin to build the wall, while an avowal on her part, which would have cost little, and which at any cost should have been made at once, might have saved all. The second act, in which we have an evening party at Madame de Privoisin's, is not necessary to the conduct of the fable. All that passes there might be made known to us in a few lines of narrative, and so it is possible to object to it; but, for our own part, we think the act pleasant to see, and regard it as a not unwise relief to the intenser scenes which follow and precede it. The third act is really the most disappointing, because it begins with a situation of which very much ought to have been made. Here the author seems to have firm hold of his

work: the grip is strong, but suddenly slackened, and the disclosure at the breakfast is followed but poorly and inartistically by the misunderstandings between Philip and Marie.

One or two details to end with. We question the wisdom of introducing the masons at all. They make too much noise, and work too rapidly—one needs must watch this wall-building, and so one misses the mental conflict in which the real interest of the scene should be. Again, in the second act, is it not quite a mistake to bring the uselessly-enamoured Monsieur de Flamarens to the door at the moment that Philip and Marie are embracing? He is disconcerted, and the audience amused; but the laugh is gained at too great a cost: nothing should break in upon our sympathy with the lovers.

Madame de Miraflore—who dies between the first and second acts—is played very well as to appearance, and pretty well as to manner, by Miss G. Pouncefort. But when perturbed, Miss Pouncefort walks about too much. She "takes the stage," as the technical phrase is, too much like a restless Englishwoman, not of the caste of Vere de Vere, and forgets her Spanish dignity. Miss Virginia Francis plays Madame de Privoisin with some feeling for comedy. She is all that the part requires. Miss Isabel Bateman is excellently natural in the gentler scenes, as Marie. She is thoroughly graceful, simple, and intelligent; but in the violent moments she fails strangely. She shakes her head impotently. Her mental power seems to desert her just when she is making calls upon her physical. Or perhaps it is truer to say that her intention is always good, and her execution weak only when she means it to be strong. But as Miss Bateman is very young, and probably has a future, she should be encouraged to study diligently all the expression of emotion; we know of no good reason why she should not eventually succeed in it as well as she already succeeds in the expression of all the gentler womanly feelings and womanly ways. Mr. Clayton plays Juan well enough to do him credit, and that is saying much when one remembers that since his Joseph Surface, much is always expected of him. But in the first act, though seemingly natural, he is a little too commonly colloquial. He is perhaps less like a Spaniard than like a travelling Englishman, and thus shares Miss Pouncefort's fault—the want of local colour. And in the last scene, his dress is ill-chosen, we think. It has about it a touch of the *bourgeois endimanché*. Monsieur de Flamarens is represented with admirable ease by Mr. H. B. Conway. The only fault people find with him is that his manner is not French; and that is a mistake, for in the Paris world it is very French to be very English.

FREDERICK WEDMORE.

GOUNOD'S "JEANNE D'ARC."

IN reviewing the musical events of the past week, detailed mention should certainly be made of the first production in this country of the most important recent work of M. Gounod. The composer of *Faust* holds so deservedly high a position among musicians and with the public that the announcement that his new music to *Jeanne d'Arc* would be brought forward at the first concert of his Choral Society last Saturday had the effect of crowding St. James's Hall to the doors on that evening. The programme comprised only two works, the "Messe Solennelle," produced on this occasion for the first time in England under the composer's direction, which occupied the first part of the concert; and the music to *Jeanne d'Arc* already mentioned, which filled the second part.

M. Gounod's choir numbers about 100 voices, and was on this occasion supported by an orchestra of some sixty performers. The chorus sang throughout with much spirit and correctness, and a very fair attention to light and shade. Deviating from the plan commonly adopted, the soloists, who were without exception members of

the choir, instead of standing in front of the orchestra, sang from their places in the chorus. Moreover, for some reason not very apparent, their names were not given in the book of the words, but only printed on a separate slip marked "For the Press only." It was next to impossible from the part of the hall where we were seated to identify all the singers; it must therefore be sufficient to state that the names given on the slip referred to were those of Mrs. Weldon, Masters Alfred and Charles Rawlings, Signor Garcia, Middle. Morren, Miss Westmacott, Middle. Martorelli-Garcia, and (strangely enough in one place) the conductor, M. Gounod himself.

The "Messe Solennelle" is tolerably well-known in this country, having been in the first instance brought forward by Mr. John Hullah at his concerts in St. Martin's Hall; and performed again some few years since by Mr. Barnby's choir. Besides this the music, either entire or in part, has been used, adapted to the words of the English Communion service in more than one of our London churches. It is therefore needless to dwell at length upon it here. It is showy, brilliant, and pleasing, but nowhere deep, and in many parts of a secular and operatic, rather than of a sacred character. On the present occasion, a new "Offertoire," which M. Gounod has recently composed for the "only authorized" edition of the work, just issued by his publishers, was given, instead of the one to be found in the former editions. The new piece must be pronounced decidedly superior to its predecessor. While possessing little that is absolutely new, it is most elegant and graceful, and embellished with all that rich, one might almost say "luscious," tone-colouring of which the composer is so great a master. The performance of the mass was on the whole an excellent one; indeed, excepting one mishap in the "Gloria," where the soloists went astray, it left little or nothing to desire. Some curious alterations were made in the disposition of the solo voice parts—the tenor solo of the "Sanctus" being sung by a soprano, while the soprano solo of the "Benedictus" was given to the tenor.

Jeanne d'Arc is not an opera, but a play, produced towards the close of last year at the Théâtre de la Gaîté, Paris. It is written by M. Jules Barbier; and M. Gounod has supplied the incidental music. The first number is an orchestral prelude, which from its development might almost be entitled an overture. It is of a pastoral character, with an important principal part for the oboe, which was delightfully played by M. Dubrucq. The pastoral tone of the music is from time to time interrupted by an ecclesiastical phrase, in the scoring of which the brass instruments and harps are combined in the happiest manner. The whole piece is a masterpiece of orchestration, and it pleased the audience so much that an undeniable encore followed. No. 2, a chorus of Fugitives "From our home we are flying," is less successful. The music is not uninteresting; but it seems deficient in the requisite agitation. To hear the chorus singing in long-sustained deliberate tones that they are flying from their homes, is certainly a new illustration of the old saying, *Festina lente!* No. 3, the supernatural voices, encouraging Joan of Arc, is a movement which, on the stage, would be most effective; but, though full of good points, it suffers from transference to a concert-room. The following number—a chorus of ladies at Agnes Sorel's court, and the page's ballad—is very pleasing, though not without occasional reminiscences. A not very striking minuet for orchestra succeeds; after which is a patriotic chorus, "Dieu le veut," which is full of spirit, though slightly commonplace. No. 7, a soldiers' chorus with song, is one of the best numbers of the work, thoroughly original and piquant. The chorus, No. 8,—a prayer before the battle—is very good, but too much spun out, so that it becomes wearisome. After a pretty but not very remarkable chorus of women is a coronation march and chorus,

very vigorous and with plenty of drums and brass, but containing little that is actually new. The remainder of the music consists of a "prison scene," a funeral march, and the final scene of Joan's execution, the music being somewhat sombre in tone. As a whole the work shows that thorough knowledge both of theatrical and orchestral effect which was to have been expected from a composer of M. Gounod's experience. That it will advance his reputation can hardly be predicted, but it may with truth be said that it is not unworthy of him.

HANDEL'S "THEODORA."

HANDEL'S *Theodora* was produced at the last Saturday Concert at the Crystal Palace for the first time at these concerts. Written in the year 1749, it was the last but one of the gigantic series of oratorios which Handel produced. Like many of its companions, it had been until recently so long neglected that, with the exception of the two songs, "Angels ever bright and fair," and "Lord, to thee each night and day," not one person in a thousand knew a note of the music. The credit of rescuing the work from its unmerited oblivion is due in the first instance to Mr. Barnby, who produced it last June, and again in October, at the first concert for this season of the Royal Albert Hall Choral Society. From the nearly uniformly sombre character of its libretto, *Theodora* is never likely as a whole to rank among Handel's most popular oratorios. Even on its first performance it was not successful, as the composer himself said—"dere was room enough to dance dere when that was perform!" Yet the work was considered by its author as his masterpiece; and though one will hardly agree with him in ranking it above all the other oratorios, it indisputably contains some of his finest writing. In examining the scores of *Theodora* and *Jephtha* it is impossible not to feel that Handel in the later years of his life is breaking new ground. Just as with Beethoven in his Choral Symphony and Mass in D, or Schubert in his great Symphony in C, or Mass in E flat, so in these two works above all others, glimpses of a new vista in art seem to open to the composer at the close of his career. To take but two instances from the oratorio under notice—how perfectly new is the chorus, "Go, generous pious youth," in which the voices end with a half-cadence, leaving the final close to the orchestra alone. Again, the fine chorus "How strange their ends" (omitted on this occasion) is as unlike anything to be met with in Handel's earlier works as it can be. More instances might be given, but these will suffice. As in all the other oratorios, the choruses are the finest portion of the work. Nobody, before or since, has ever approached Handel in broad effective treatment of large vocal masses. Such movements as "Come, mighty Father," "All power in Heaven," "He saw the lovely youth," and "Blest be the hand" could have come from no other pen than that of the author of the *Messiah*. The dramatic contrast, too, of the heathen choruses, such as "For ever thus stands fixed the doom," and "Venus laughing from the skies," with those of the Christians, reminds the hearer that the work is the production of one who was the first operatic writer of his day; and the solo parts are no less individual in character. The comparative non-success of the oratorio may be largely attributed to the libretto, which is in many places even more silly, not to say idiotic, than the average poems which Handel had to set to music.

The performance was, on the whole, an exceedingly good one. The choruses were sung with a spirit and precision which furnishes a favourable augury for the future, while the band, it is needless to add, was perfection. The soloists were Madame Sherrington, who is heard to much greater advantage in florid operatic music than in Handel, Miss Dones, Miss Antoinette Sterling, Mr. Cummings, and Signor Agnesi, all of whom were excellent. A special word of praise must, however, be given to Miss Sterling, as a comparatively new-

comer, for her admirable rendering of the part of Didimus. The lady sings like a true artist, and seems to improve at each hearing. The additional accompaniments, which are from the pen of Dr. Hiller, are unobtrusive and in excellent taste. A prominent part is in many numbers given to the organ, which was in the competent hands of Dr. Stainer. Mr. Manns must be heartily congratulated on the success of the performance.

EBENEZER PROUT.

NOTES AND NEWS.

AFTER the closing of the Salon, it is in contemplation to open an exhibition in Paris of the produce of the three great Government manufactories, Sèvres, Beauvais, and the Gobelins.

ONE of the most important pictures that have been painted by M. Gérôme has just been despatched to a purchaser in America, after having been exhibited for some days in the window of Messrs. Goupil, 2 Place de l'Opéra, Paris. It represents a gladiatorial combat in the arena, at the moment when the victorious combatant, with his foot upon his prostrate antagonist, appeals to the audience for the decision of life or death. Almost as much pains have been taken with the accessory parts of the picture, the draperies of the balconies, and the crowded tiers of spectators, as with the principal figures. In the painting of the helmets and harness of the gladiators, and of the Oriental hangings of the boxes, M. Gérôme has put forth his utmost strength in the painting of metallic surfaces and tissues. The colouring and lighting of the picture are unusually forcible as well as agreeable. The most expressive parts are the figure of a gladiator already slain, lying apart from the principal group, and the bench where the vestals sit or stand in the act of giving the death-signal. The expressions in this latter episode seem somewhat forced and common.

MR. FORD MADDOX-BROWN has just completed portraits of Mr. David Davies of Llandinam, the newly-elected Liberal M.P. for the Cardigan District of Boroughs, and of Mrs. Davies. These are presentation-works commissioned by the Lessees and Directors of the Ocean Steam Collieries; with which, and with very many works of public improvement in Wales, in the way of railroads and otherwise, Mr. Davies is closely connected. The portraits are life-size, three-quarters length; each sitter forms the subject of a separate picture. Each is represented seated; Mr. Davies as if he had recently come in to business, Mrs. Davies, as half-occupied, or more than half unoccupied, in knitting-work. Some old stamped leather of a floreated pattern forms a rich and slightly background for this latter sitter. Both works are solid manly examples of portraiture, free from any forcing or overloading; living and half-speaking faces—not very different from the faces of hundreds of other people that one has seen, and yet different with that unmeasured and impassable line of severance which distinguishes each human countenance from all others. So long as the member for the Cardigan District is remembered (and we believe that he well deserves to be borne in memory as a "self-made man" whose private fortunes have been linked with public advantages), this version of a shrewd, prompt, clear-minded Cambrian face will always assist its spectator to understand the man, and to see into the sources of his success. Some of our readers will recollect the very fine portrait-group of Professor Fawcett and his wife, painted about a year and a half ago by Mr. Maddox-Brown: they will have no difficulty in understanding what are the artistic merits of the likenesses of Mr. and Mrs. Davies.

THE excavations carried on in the Coliseum at Rome are threatened by the *Ercommunication major*. The Italian Government had undertaken them, not so much from a love of art as in order to avoid certain political difficulties. It had at first declined to allow the Coliseum to be used as a

place of amusement during the Carnival. In order to clear itself from the suspicion of acting under clerical influences, it had afterwards forbidden divine service within the precincts of the old amphitheatre. Not having the courage to remove the sacred stations and crucifixes from the Coliseum, it ordered archaeological excavations, which naturally led to their removal. Signor Rosa, the director of the excavations, has received notice from Cardinal Guidi that, unless he desists from his work of desecration, he will be excommunicated. As yet he does not seem to be frightened, and the orchestra of the old theatre of Vespasian has already gained an additional depth of two metres.

ON the 26th and 27th of last month the sale took place at Paris, of the well-known collection of Mr. Willet of Amsterdam. The prices obtained in Paris for works of art are generally higher than here—why, we can hardly say, unless it be that there are more earnest collectors of one special branch of pottery in France than here, where fashion or the beauty of the specimen guides the choice. The majolica fetched a high price. A Maestro Giorgio, flat plate or *tagliere*, sold for 107*l.* 4*s.*, a dish on low stem, *piadene*, for 72*l.* 10*s.*, and another for 51*l.* 4*s.* One of those plates, with hollow centre and wide rim, called a *tondino*, by Giorgio's son, Maestro Cencio, fetched 35*l.* 4*s.* A *piadene* of Diruta ware, attributed to the master who signs El Frate, sold for 33*l.* 4*s.*, and a circular dish of Caffagiolo for 3*l.* The Faenza plates ranged from 20*l.* to 24*l.*, and a large Pesaro dish of metallic lustre, attributed to Maestro Girolamo, was knocked down for 50*l.* 8*s.* The *Judgment of Solomon*, Forli manufacture, sold for 1*l.* 4*s.*; and an Urbino dish, subject, Cadmus killing the serpent, attributed to Orazio Fontana, sold for 4*l.*, and another, the subject, Midas, for 3*l.* A dish attributed to Nicola da Urbino, Joseph's brethren presenting him his tunic to their father Jacob, and comprised of six figures, fetched 22*l.* 10*s.* A set of Delft jars and beakers sold for 125*l.* 4*s.*, a Delft ewer for 26*l.* 4*s.*, and a Vernis Martin fan for 40*l.* The sale realised nearly 2,000*l.*

THE February number of the *Gazette des Beaux-Arts* is very rich in literature. Besides the chapters of Charles Blanc's "Decorative Art," René Ménard gives a description of several frescoes by the Arezzo painter, Spinello Aretino. Two of the frescoes from San Miniato al Monte are engraved, as well as a beautiful Madonna picture from the Cathedral of Siena. (Spinello, it will be remembered, is the painter of whom Vasari relates that he died of fright and remorse, in consequence of a dream in which the devil appeared to him under the form in which Spinello had represented him, and demanded to know why he had made him so ugly.)

The painted vases of Greece are the subject of a further study by Albert Dumont. "The Musicians of Luca della Robbia" is the title of a short paper by P. Senneville, describing ten exquisite bas-reliefs on the organ in Santa Maria della Fiore, two of which are engraved. The French school of painting as represented in the Musée de Lille is criticised by Louis Gonse. The artistic curiosities of Russia are commented upon, and several illustrations of them given. *Nicòloto de Modène fut-il peintre ou sculpteur?* is the question asked by Emile Galichon, who, however, does not answer it, but confines himself to the consideration of several works in niello that he supposes were executed by this artist; and the Belvedere Gallery at Vienna receives another notice by Clément de Ris. The Dutch School is now finished, and the French School under review.

THE *Boetzel Album*, a collection of engravings from the pictures of the Salons of 1872 and 1873, is highly praised as one of the best artistic productions of the year, and the Musée de Nancy and the collections of Alsace, Lorraine, are described by Charles Courmault.

AN exhibition of the works of Prud'hon has been organised for the benefit of his daughter, who it appears has fallen into poverty. It will be opened on the 1st of April at the Ecole des Beaux Arts. Possessors of Prud'hon's paintings or drawings, who may be willing to contribute, are requested to communicate at once with M. E. Marcille, rue d'Hauteville, 54, and to send an account of the work they wish exhibited in order to facilitate the preparation of the catalogue.

THE regulations for the Salon of 1874 are published, and may be found in the *Chronique* of January 24. M. de Chennevières has made his "Règlement" as pleasant as possible to artists; still that excitable fraternity will not regret that this is the last time that the government will regulate for them. Henceforward, as before stated, the management of the Salon will be vested in the new National Academy of French artists.

DR. HEINRICH GUSTAV HOTH, a well-known German writer on the history of art, died a short time since at Berlin, at the age of seventy-one. He held the position of keeper of the Museum of Engraving at Berlin. The death of M. Buchère de l'Épinois, Chevalier of the Légion d'Honneur, and a writer on art of some note in France, is also announced.

A NUMBER of packing cases of every size and description, amounting to more than a hundred, have lately been deposited in the Cour Carrée of the Louvre. They have been sent home by M. Delaporte, a young lieutenant in the French navy, who about a year ago set out with several other naval officers (among whom we believe was the ill-fated Lieutenant Francis Garnier) on an exploring expedition up the river Tonking. The object of the exploration was to discover whether a communication between China and the Indian Ocean could not be opened by means of the Tonking. While prosecuting his geographical and scientific researches for this purpose M. Delaporte has not, however, been unmindful of the interests of archaeology, and has sent home in the packing cases before mentioned a large and important collection of ancient monumental remains that he has discovered on the banks of the Tonking and in its neighbourhood. Ancient Asiatic architecture and sculpture of this description can seldom be studied except by Oriental travellers. Home-stayers are at best obliged to content themselves with casts, so that the Louvre is fortunate in having gained such a valuable addition to its stock of Oriental antiquities.

A SHORT biographical sketch of John Christian Schetky, under the heading "A Marine Painter of Two Centuries," appeared in the *Times* of the 9th inst. J. C. Schetky, who died on the 29th of January 1874, was born in 1778. He was a descendant of an old Transylvanian family, and appears to have inherited his artistic tastes from both his parents. At the high school of Edinburgh he was contemporary with Lord Brougham, Leonard and Francis Horner, and Sir Walter Scott, with the latter of whom he formed a life-long friendship. Many other of the distinguished men of the early part of the century were likewise his constant companions; but he was most proud, his biographer in the *Times* tells us, of his "interviews with two men, remarkable for very different causes—Robert Burns, his father's friend, who begged him off a flogging for playing truant to sail toy ships at Leith, and the younger brother of the Chevalier Henry, Cardinal York, whom he met in his lumbering coach in the Roman Campagna in 1801, and by whom he was questioned as to the welfare of 'his army and navy.'"

Schetky may be termed the successor of Willem van der Velde, in so far as his office of royal marine painter led him to paint the same class of subjects, but he had not the Dutch artist's power of ruling the waves. It was ship-painting rather than sea-painting that engaged his attention. At the age of eighty-two he painted one of his finest

works, the *Rescue of a Spanish Man-of-War* by Sir C. Paget, now hanging in the United Service Club.

AT the sale of the works of Ch. de Tournemine, which took place last week at the Hôtel Drouot, the following prices were realised:—*Maison turque au bord de l'eau*, 3,900 fr.; *Ruines d'un Temple au bord de la mer*, 3,950 fr.; *Campement en Asie-Mineure*, 1,450 fr.; *Un Café à Adramitti*, 1,030 fr.; *Maison turque sur le bord d'une rivière*, 3,350 fr.; *Lac sacré d'Oudeypour*, 3,200 fr.; *Retour de chasse (Hindoustan)*, 2,100 fr.; *Ruines du Temple de Janina*, 3,000 fr.; *Éléphant traversant une rivière*, 1,400 fr.; *Pyramides vues du Nil*, 1,400 fr.; *Oiseaux sur le Nil*, 2,400 fr.

WE hear from Rome of the death, in the prime of life, of the promising Belgian sculptor, Gaston Marchant, who in 1869 gained the "Prix de Rome" of the Brussels Academy. At the time of his death he was engaged in putting the last touches to his statue of a fisherman throwing his net.

ON the 21st of this month is to be sold at Paris the splendid gallery of M. F. Szarvady, the well-known publicist. Amongst the eighty-six pictures enumerated are fifty-six belonging to the old Italian, Dutch, and German schools. The gems of the collection are said to be two Lucas Cranachs, a St. Gereon, and a St. Ursula with her Companions.

THE *Cologne Gazette* seems to be possessed by an uncomfortable suspicion that too much caution cannot be exercised by travellers and explorers in accepting as genuine the relics and "antiques" which are presented to them for purchase in the East. According to the writer, there is at Constantinople, within the palace of a Persian Governor, a manufactory for the preparation of ancient gems and the so-called Arsacides coins; whilst numerous medals, coins, fragments of antiques, and other archaeological treasures, all of which had been skilfully prepared for the purpose in the suburb of Galata, were lately being offered for sale to Western travellers by the workmen employed on the repairs and excavations which are at present going on near the ruined propylæa of the Hagia-Sofia. Here the deception was especially successful, as every passer-by had an opportunity of seeing these precious "finds" brought to the surface with every spadeful of freshly-turned earth. Occasionally, however, genuine treasures undoubtedly find their way into the hands of unscrupulous workmen, for it appears from the report of the search instituted by order of Nassif Pasha, Governor of the Dardanelles, to which we have referred in a previous number, that a considerable portion of Dr. Schliemann's so-called "Priam's Treasure" had been stolen by two Greeks in his employment, and carried by them to their village, where the spoil of one of the men, Lezeb Costandi, has been recovered almost uninjured, while the portion which fell to the share of his companion, Staliano Panayoti, has to a great extent been destroyed by having been given to a jeweller to be melted down and recast into ornaments for the bride of the thief. It appears that the robbery was effected as early as last March, and therefore three months before Dr. Schliemann left the scene of his explorations in the happy possession, as he believed, of the whole of the Priam Treasure. The men had, however, one evening in his absence come upon an earthen vessel, six inches high and three inches wide, which lay at a depth of thirty feet from the surface and about eighteen feet from the base of an ancient wall. The excessive weight of this jar led them to suspect the nature of the contents, and in the course of the night they conveyed it to their own village, where they examined their spoils, and, after dividing them, buried their respective portions. Amongst the articles recovered are two pairs of gold ear-pendants, several golden rings, and two bracelets, an ornament for the head, and four necklets or rosaries with golden beads about the size of peas, and, besides these

articles, small lumps of gold and numerous fragments of chains were also found.

THE Greek Government has, it is reported, expressed its willingness to allow the contemplated excavations at Olympia to be under the management of a joint commission of German and Greek savans, and to permit the Germans to select the spots where the works shall be undertaken. If this joint commission can be trusted to work with unanimity, we may anticipate very important results from the projected exploration of the Olympian district, which, as a focus of Greek festive life and a spot on which Greek art may be said to have thrown its treasures broadcast, can scarcely fail to yield a rich harvest of artistic wealth to the explorers.

SCENE-PAINTING, as applied to the representation of landscape on the stage, may be thought to have attained perfection some few years ago. The efforts of Beverley and Telbin are not to be surpassed in their own kind; and under Mr. Charles Kean's management at the Princess's the decorations were as accurate as they were costly. Many people thought they overpowered the acting, and the managers of the Théâtre Français—whose judgment ought to be, but is not always, infallible—would probably have been of this way of thinking. So would several French critics, who lately remarked that in the "mounting" of *Jean de Thommeray* the Théâtre Français itself was going dangerously near to an unworthy rivalry with the spectacular theatres of the Boulevard—rivalry in incorrectness as well as in lavish magnificence, it appears: M. Alfred Darcel having pointed out in the *Chronique des Arts* that a certain little castle of brick and stone, in the style of Louis Treize, did not belong to Brittany, either in material or manner. Correctness apart, modern scene-painting is certainly very effective; but it may be questioned whether it will not some day endeavour to represent a greater variety of landscape instead of confining itself, as it now does, to the very obviously picturesque and romantic. And yet of course the conditions of light may fetter it a good deal, to interfere with its range; and, also, the taste of the many has always to be considered—the many having at present little appreciation of any other scenery than that which is immediately recognised to be either lovely or grand. A stage-reproduction of a Claude landscape or of a Turner landscape may do very well; but the reproduction of a Rembrandt or a Hobbema—grey and weary and wide—would almost surely fail of success. We have much to be thankful for, and do not mean at all to grumble, but merely to point out what seem our present limitations. But with regard to the arrangement of stage-interiors, improvement is more surely practicable. Have we not had enough of the octagonal drawing-rooms with a regiment of chairs from Tottenham Court Road—all ranged in valiant row—with gay wall-papers and shabby prints, and for all drapery a crimson curtain, to represent the taste and luxury of Mayfair? Here and there one notices an improvement: chiefly perhaps where Mr. O'Connor has been at work. Like most people who enjoy the possession of manners that are passports, Mr. O'Connor has doubtless arranged some things not quite worthy of him. But just now he has two modern interiors which are a little out of the conventional stage way, and are so much the better for it. His drawing-room at the Royalty, in *Ought We to Visit Her?* is the result of a good conception, imperfectly realised: a Jacobite room: a "constructive interior" (as some new advertisements say) with something that is pleasant and something that is bad. Here the hand has not been lavish enough. The tone of the room is good, but the accessories insufficient. But in that very pleasant chamber tenanted by Smalley—the arch-ruffian of the new comedy at the Haymarket—the work, though scarcely fine, is more complete than harmonious. The eye rests not unhappily on the

dull ebonised dressers, stored with blue china—though the china be not of surpassing quality—and on the quiet-coloured walls, though these be hung with nothing more precious than the Japanese fans, the love of which has lately provoked the *Saturday* to an exhibition of manly satire.

We hear from Munich that a scheme is at present under consideration for supplying the larger theatres with a system of waterworks, by which a copious stream of water may be turned instantly on the stage, or any other part of the building, in case of fire. It is proposed to lay down a network of pipes below the floor of the stage and slips, and to connect these, by means of a large main, with a capacious reservoir, thirty or forty feet above the floor. In an experiment lately made at Munich to test the efficacy of the plan, a fire was kindled the whole length of the main pipe, and when the flames were at their height the water at a given signal was turned on, and the fire instantly quenched. Should this simple scheme admit of easy practical application, we may hope that we have heard the last of those theatrical conflagrations which, to the disgrace of our boasted scientific progress, have hitherto occurred with terrible regularity.

LEROUX, an actor well known at the Français, died ten days ago at Algiers. He was manager of the French theatre there: a post for which he was not incapacitated by that sudden loss of memory which two or three years since very greatly interfered with his otherwise creditable success as an actor in the Rue Richelieu.

THE long farce of *L'Infortunée Caroline* has been succeeded at the Holborn Theatre by Cadol's best-known play, *Les Inutiles*, of which we propose to say something next week.

AMY ROBSART is being played at Drury Lane; the heroine's part, originally taken by Neilson, is now sustained by Miss Wallis, seemingly to the satisfaction of the audience, and, in truth, intelligently.

M. GUSTAVE FLAUBERT, the author of *Madame Bovary*, has written a piece for the Vaudeville (Paris) called *Le Candidat*.

THE 5th of February was appointed for the formal trying of the great bell for the cathedral at Cologne. It is now finished, but it still remains at Herr Hamm's foundry in Frankenthal, where it was cast, and where its tones are to be tested by the musical commission appointed by the directors of the cathedral works, at the head of which stand Herr Weber, the chief musical director, and Dr. Hiller. Their verdict has not yet been made public.

THE second concert of the British Orchestral Society at St. James's Hall last Thursday week showed on the whole an improvement (for which there was abundance of room) on the previous one. The instrumental pieces given were the "Jupiter" symphony, and the overtures to *Leonora* (No. 3), and the *Isles of Fingal*. The last was the best performance of the evening; Beethoven's overture, however, though less perfectly given, was encored by a more demonstrative than numerous audience. The instrumental soloists were Madame Kate Roberts, who gave a very neat performance of Bennett's Caprice in E for piano and orchestra, and Mr. C. W. Doyle, the principal violin of the orchestra, who played in a thoroughly artistic manner David's concertino for his much neglected instrument. The vocalists were Miss Julia Elton and Mr. Edward Lloyd. English music was again but sparingly represented at this concert—the only pieces by British composers being the above-mentioned caprice by Bennett, and two songs by Sullivan, and the late F. E. Bache. If the two concerts already given are to be taken as an indication of the future of this society, it is impossible to predict for it any great success. The public are not likely to go to hear well-known overtures and symphonies

rendered in only a second-rate manner, when they can be heard to much greater perfection elsewhere. There is at present a want both of fire and finish in the performances, which is the more surprising considering the individual excellence of the members of the band. The conclusion is forced upon us that Mr. Mount is hardly "the right man in the right place."

AT last Monday's Popular Concert, Dr. Bülow made his last appearance for the present at these entertainments. He plays only once more (at the Saturday Popular Concert this afternoon), before leaving England. He selected for his solos three movements—a prelude and fugue in F minor, a chaconne in F major, and an air with variations in D minor, from Handel's *Suites de Pièces*, for the harpsichord, all of which he played in his most masterly manner. An even greater treat, however, to connoisseurs was given by the production, for the first time at these Concerts, of Beethoven's Sonata in C, Op. 102, No. 1, for piano and violoncello, in which he was joined by Signor Piatti. Like the companion work in D major, performed a few weeks since by the same artists, this sonata belongs to Beethoven's latest period. There is probably no living pianist so competent an exponent of the later pianoforte works of Beethoven as Dr. Bülow; and it may be safely asserted that there is no violoncellist in this country who can compare with Signor Piatti, whose performance, whether as regards purity of intonation or artistic feeling for the music, was unsurpassable. The whole sonata was a musical treat of the highest order. The concert opened with Mozart's Divertimento in B flat, for stringed instruments and two horns, which had been more than once previously produced here. Though by no means one of its author's greatest works, it is full of pleasing melody, especially in the opening movement and the two minuets. It was admirably performed by Messrs. Straus, Ries, Zerbini, Piatti, Reynolds, C. Harper, and Standen. The two last-named gentlemen, who took the horn parts, deserve especial praise for the discretion with which they played; as the powerful tone of their instruments might without great care on their part have overweighted the strings. The concluding piece was Molique's trio in B flat, recently produced here, and repeated by desire. As the work was spoken of on the occasion of its previous performance, it is needless to do more than mention it here. The vocalist was Madame Patey, who sang Giordani's 'Caro mio ben' and Randegger's 'Peacefully slumber.' The former has been heard *ad nauseam*. Madame Patey might enlarge her repertoire with advantage both to herself and her hearers.

Next Monday will be signalled by the first appearance for the present season of Herr Joachim.

MR. MACFARREN'S *St. John the Baptist* is announced for performance by the Sacred Harmonic Society next Friday week (the 27th) being its first production in London.

MR. HENRY LESLIE'S choir gives its first concert for the present season on Thursday evening next.

WILHELMJ, the violinist (says the *Paris Figaro*), is at present in Paris; it is, however, doubtful whether he will appear in public, as it is feared that the fact of his being a Prussian may give rise to demonstrations.

IN Weimar a complete performance of Goethe's *Faust*, with music by E. Lassen, is in preparation.

WAGNER'S *Lohengrin* has lately been produced for the first time at Stockholm. A Swedish paper, the *Aftonbladet*, makes the curious remark that the opera did not excite the *furor* which "from several causes was to have been feared!"

HERR HERBECK, one of the most distinguished musicians of Vienna, has been compelled by ill-health to resign his post as conductor of the Hofopertheater in that city. Herr Joseph Sucher,

a young Viennese composer, is spoken of as his successor.

MADAME SARA HEINZE, a well-known pianist of Dresden, has received from the King of Sweden the gold medal for arts and sciences.

A SERIES of highly interesting critical articles on the recent works of Johannes Brahms, from the pen of Dr. Hermann Kretschmar, is at present in course of publication in the *Musikalisches Wochenblatt*.

THE fourth concert of the Wagner Society, which took place last evening, comprised, among other interesting items, Berlioz's overture to "Le Carnaval Romain," and a large selection from Wagner's *Lohengrin*. We shall notice the concert in detail next week.

THE Milan papers announce that Verdi has just completed his mass composed for the anniversary of the death of Manzoni, and that he has visited the finest churches of Milan to choose the one most suitable for the ceremony.

POSTSCRIPT.

As we are going to press we have received the following important note from Dr. Kirk:—

18 Herbury Crescent, Feb. 12.

This morning I have heard indirectly from Zanzibar, and find people there who could judge still question the truth of the story of Livingstone's death. Like us, they see nothing but native report to base it on.

J. KIRK.

DR. SIEMENS has just completed a screw steamer, the *Faraday*, designed entirely for cable work. Although only of four or five thousand tons, she has as much cable room as the *Great Eastern*. There are several points of novelty in the construction of this vessel. She is made perfectly symmetrical fore and aft, with a rudder at each end, so as to move in either direction with equal ease and accuracy. This is of the utmost importance for cable work, as it enables the cable to be picked up with the least possible expenditure of trouble and time; the whole of the paying-out machinery becoming in a few moments paying-in machinery. She has no keel at the bottom, but two bilge-keels or keels running along the sides, so that the cross-section is very nearly rectangular. This arrangement diminishes the rolling very considerably, and allows more room for tanks. She is driven by twin-screws, whose axes converge; the object of this is to obtain greater turning-power when the screws are driven opposite ways, which is possible, as their engines are independent. The axes of the screws would pass the centre of gravity of the ship at a distance of 27 feet. In this way the head of the ship can be kept to the wind when she has no way on. The launch will take place on Tuesday next at Newcastle, and is an important event in the practical application of electrical and mechanical science.

WE learn that an edict has just been issued by the Emperor of China, commanding the rebuilding of the famous summer palace which was destroyed by the French and English armies during the last war. This work will cost a very large sum, and the Imperial edict sets forth that, in consideration of its national importance, it is hoped that the faithful subjects of the Emperor will cheerfully bear the increased taxation necessary for the purpose.

It is rumoured that the youthful Emperor of China (now in his twentieth year, we believe) has availed himself, in a truly Eastern fashion, of his newly acquired liberty, and has horrified the staid and respectable members of his court by wandering about his capital incognito, and at unseemly hours. Considering that his Imperial Majesty was only married sixteen months ago, and has so recently assumed the reins of power, this erratic conduct on his part is of bad augury for the future.

[Price 4d., or by post 4½d.; published every Saturday in time for the early trains.]

THE ACADEMY

A WEEKLY REVIEW OF LITERATURE, SCIENCE, AND ART.

WITH the Fifth Volume the ACADEMY entered at the beginning of the present year upon a new phase of its existence. Instead of 480 pages of text a year, it now publishes, in fifty-two weekly numbers, 1040 pages, each of which will contain one-fourth more matter than the old ACADEMY page.

Three-fourths of each number of the new ACADEMY is devoted to Literature of the Imagination, Travels and Antiquities, History and Biography, and includes regular notices of the Picture Exhibitions, the Music of the Season, and the current Drama, English and French. There are periodical news-letters on literary, artistic, and scientific subjects from the chief capitals of Europe, and from America; and an adequate space is set apart for correspondence between literary men, jottings of interest, publishers' announcements, personal news, and the like. In all these matters the ACADEMY tells people of all classes who are aiming at the higher culture, what to choose and what to discard, in unmistakeable terms and with promptitude.

The remaining fourth part of the periodical is occupied with scientific matters interesting to a smaller class of readers, but divested as far as possible of all unnecessary technicalities which render them uninteresting or unintelligible to the educated as distinguished from the scientific reader. The various departments of knowledge have now become so minutely specialised, that even the scientific man can no longer hope to keep pace with discovery in all directions at once, and beyond the limits of his own peculiar study occupies to a greater or less extent the position of the educated layman or general reader. So that the wants of the small scientific class are in this respect identical, or nearly so, with those of the larger reading public. These requirements vary in different countries and at different periods, and can only be ascertained by actual experience. Our experience during the past four years has been that the scientific matter to be found in the ACADEMY has been pitched in too high a key, or at least has been presented in too technical a form to be so practically useful even to the scientific reader in this country, and at the present time, as it might without any diminution of fulness or accuracy be made. We propose then to ourselves a much more difficult task than we have hitherto attempted, viz. that of making this department of the ACADEMY useful to all, and engaging the attention and interest of all educated persons in the progress of European knowledge.

This department will embrace Natural Philosophy, Theology, and the Science of Language, especially of the English Language and Dialects, and the very important and interesting study of Comparative Philology, in connection with the Mythology, Folklore, Manners, Customs, and Institutions of the various races of Mankind.

It may be asked, why retain the name ACADEMY if the paper is to be so entirely re-organised as to form to all intents and purposes a new critical organ?

We have re-organised the paper because we think that such a critical organ as we have described is wanted. As to the retention of the name, a few words of explanation are necessary.

Very few persons have, we think, understood what was meant by calling

the old fortnightly periodical, which we now propose to supersede, the ACADEMY.

The word "Academy" suggests to most average Englishmen, in the first instance, the idea of a second-rate and pretentious private school. It is also the name of a chartered Institution in London, which has won a reputation for fairness and discrimination in hanging pictures. As the name of this periodical, it appears to have given the impression to some persons that we propose to ourselves to treat of matters exclusively interesting to schoolmasters and professors at the Universities. But in all European languages except the English an "Academy" means a *central organ of sound information and correct taste in intellectual matters*. The great French Academy founded by Richelieu has more particularly taken under its charge the maintenance of the purity of the French language. The Academies founded in the principal German Capitals, and elsewhere, in imitation of the French, have laid a greater stress upon the maintenance of correct information in matters of scientific knowledge; and the renowned Academy of France has added to itself special Academies having the same object.

Now it is in the sense in which the word is understood on the Continent, in the sense of a standard of correctness in intellectual matters, that the name was and is still applied to the ACADEMY Journal. The great national importance of concentrating the intellectual forces of a country is recognised in every country but our own; and this recognition has justified the employment of public funds for the maintenance of the Foreign Academies as public Institutions, and the partial support of their members. And the absence of such an Institution in England has had this result, that a larger amount of bad work both in literature and in science passes unchallenged in this country than in any other, standing upon the same level of civilisation.

What, then, in other countries is done for learning and science by means of an Institution supported at the public expense, we propose to accomplish in this country, not only for these but for all the materials of culture and refinement by means of a periodical subjected, after the English manner, to the economic conditions of supply and demand, viz. to keep the reader up to the mark of what is best in the world, to gibbet mercilessly what is bad, and to criticise with sympathetic fairness what falls between these two extremes.

Keeping thus always to the main stream of the best production, we shall have to point to Germany for Science, to France for Art, but to our own country for Poetry and Fiction, for the Literature of Manners and Society, for Travel and Adventure, as well as for the great philosophic ideas which are transforming the mental horizon of mankind.

But there is, we are firmly convinced, no necessary connection between setting up a standard of correctness and being unintelligible or unattractive to the average reader. It is true that much of the attractive writing in this country is deficient in accuracy, and perhaps no less true, that our own work hitherto has preferred accuracy to attractiveness. Still we believe that it is practicable to unite both these qualities in criticism; and by our elaborate organisation of departmental editing, we confidently expect that we shall be able, as we have determined, to unite them in our new issue.

Subscription for one year, including postage, 19s. 6d.; for six months, 9s. 6d.; payable in advance.

Published by WILLIAM GREIG SMITH, at the Offices, 43 Wellington Street, Strand.

SATURDAY, FEBRUARY 21, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER and not to the EDITOR.

LITERATURE.

Literary Remains of the late Emanuel Deutsch.
(London: Murray, 1874.)

To review the work of a life is difficult. It is most difficult when that life has been devoted to a great enterprise pursued under dire disadvantages, and has been cut short in the youth of its career. Such was the case of Emanuel Deutsch, the great Talmudic scholar, whose collected essays are now published. Happily for his fame, he lived long enough to sketch out what he desired to accomplish, and he did this with the firm hand of a master, leaving no main line undrawn in the vast outline, and in many parts filling in every detail. Thus, in reviewing his work, instead of feeling that there is anything that needs excuse, one fears to say what might appear too much.

Deutsch's great enterprise was the explanation of that prodigious encyclopædia of Jewish thought the Talmud, and this of necessity led him to a study of the history of the Hebrew race from the oldest period to the age of the Reformation. Hence his palaeographical researches, and hence his extraordinary knowledge of Church history. Everything he wrote had some connection with his main object: the greater part directly bore upon it. It is therefore that object, and the degree in which he attained it, that now concerns us.

He brought to his work a most happy combination of qualities. These his biographer has admirably drawn in the true and most delicate portrait in the short memoir prefixed to the essays. A Jew endowed with the highest characteristics of his race, intense yet mobile, deep in his affections yet large in his sympathies, he was a German in intellectual subtlety, a Frenchman in social humour, and an Englishman in his tastes. But he was far more than a man of fine nature and great accomplishments: he was a critical scholar and a philosophical thinker. The material upon which he brought his great power to bear was a trained knowledge of Jewish literature which put him in the front rank of Talmudic scholars. Other men have had his knowledge, but not one of them has been able to use it.

The famous article on the Talmud, in which Deutsch presented the outline of his work, took the whole learned world by surprise. Nothing like it had appeared before it, and though we heard on all sides that it would be followed by fifty more by other hands, it has not had a single successor. It was not merely that the writer was learned; he knew how to use his learning scientifically, and with the human feeling that comes of a character to which many forms of humanity have contributed. It is thus that the Talmud article is something wholly different

from its dry predecessors, in all respects a work of the first quality. Some readers, indeed, found it, so they said, obscure. For this there were two causes: it certainly presupposed a slight, very slight, knowledge of the Semitic East, and it did not attempt to adapt philosophy "to the meanest comprehension." Those who, being fairly educated men and women, took the pains to read it carefully, found themselves acquainted with the very grammar of Jewish thought.

The method in this article is strictly scientific; upon this the author always insisted: hence the great value of his results in their bearing on the history of religion. He did not feel himself bound to take any side. Very conservative and deeply attached to the Jewish race, he yet succeeded as far as any man could who was full of the enthusiasm that springs from a sense of work that he has to do, in looking at his subject from without. Having thus an external foothold, he moved the world of religious thought. Before his time it was held that Judaism and Christianity were antagonistic. He has affirmed their positive relation, and done more than any one for many a century to produce a real Eirenicon. His affirmation, which is too important to be lightly touched on, rests on his view of Jewish ethics, as to the facts of which no one can dispute his position. His corollary, again, that Christianity has the glory of spreading these ethics throughout the Gentile world cannot be disputed, though it may be reasonably asked whether Christianity did not also put them in a clearer form, and immensely strengthen them by embodying them in a personal example. Hillel and Shammai disappoint us: Hillel is merciful, therefore he is weak; Shammai is severe, therefore he is cruel. Thus we should argue, though we welcome the proof of the continuity of revelation as a splendid addition to the history of the religious education of the world. Had the work on the Talmud, long tantalising us in Mr. Murray's list, ever appeared, we should have been perhaps better able to judge of the magnitude of what its author had achieved; but the article showed that the subject was already mastered, and what remained to be done must have been essentially mere detail. Thus it may be truly said that he did not leave his work undone.

This essay, however, large as it is in its comprehensiveness, fills but a small part of the volume. With it are pieces which may be called introductory, on the Semitic Languages, the Targum, and the Samaritan Pentateuch, and what may be called a supplementary one on Islâm. The introductory group form the best direct evidence of the fine scholarship and clear critical power of the writer. We regret that a singularly beautiful exegetical essay—that on Lamentations—was not extracted from Kitto's Cyclopædia, in addition to that on Semitic Languages. The remarkable paper on Islâm seems to us the least satisfactory of Mr. Deutsch's works. He saw the Jewish race everywhere—it certainly is almost everywhere—but whether it is at the root of Islâm we doubt. His theory, supported by extraordinary ingenuity, does not, in our judgment, make sufficient allowance for the peculiarities of the Arab nature, or for

agreements that may be mere coincidences. Still it is a very curious view of the history of Islâm, and deserves careful examination.

The articles on the Oecumenical Council, under that and other names, are further away from the great subject than the other contents of the volume. Yet no man who had deeply studied the history of the Jewish race could have failed, as we have already hinted, to study the history of the mediæval Church. And with what effect these studies were pursued may be seen in those articles, which show not merely great knowledge and a singularly happy power of expression, but also that political consciousness without which no man can pretend to the character of a truly independent thinker.

All scholars will join in the regret expressed in the memoir, that Deutsch's fine genius was lost to us for want of a position in which he could have been free from care, and could have studied without hindrance. It is now too late, and those who knew him and who love him still, can only lament that England threw away the life of one who was loyal to his adopted country with the true Hebrew loyalty. All the while that he was slowly perishing, such a professorship as a college tutor would despise would—we call his biographer to witness—have saved him; yet somehow, in some strange dull way, it was not possible, and the moving universe of science is stopped in its revolutions for want of the one man who alone knew one great subject. If the state was afraid of the taxpayer, had the Universities—sweet stepmothers of learning—nothing for a man worth an army of commentators, a man too in whose contributions to theology absolute good faith and the scientific method had forced even the most unwilling applause of the Church? A true scholar's life, his was the hardest: to-day famous, to-morrow he dies almost alone in the distant land to which he had gone too late. But there is a great void, and when men pause in the pursuit of selfish ends, and wonder why they are so dreary, they recollect perhaps for a moment the joyous nature, rich with varied gifts, which has left their company; and when they ask for a reason, there comes no answer but this hopeless moral: Against stupidity even the gods fight in vain.

REGINALD STUART POOLE.

Rome or Death. By Alfred Austin. (William Blackwood and Sons.)

The Disciples. By Harriett Eleanor Hamilton King. (Henry S. King and Co.)

Rome or Death is the third canto of the *Human Tragedy*, which in its final form is to consist of four cantos (the first draft consisted of two). In a sense it may be regarded as a sequel to *Madonna's Child*, for we hear what became of "Madonna's Child" and her lover. The third principal character we shall probably find to be another old acquaintance when the completed poem is before us; he, like Godfrid, is permanently disposed of, but Miriam, who appears in the present part for the first time, and Olympia, "Madonna's Child," are left alive for the fourth part, which is to deal with the War of the

Commune, as the third part deals with the War of Mentana.

One of Scott's critics assured him that it was a mistake to introduce the Battle of Bannockburn as an episode in the loves of the Lord of the Isles, though love might very properly be introduced as an episode into an epic on the Bruce. Mr. Austin has been guided rather by the critic's precept than by Scott's practice, and, as he treats the matter, Garibaldi is less of a personal hero for the campaign of Mentana than Bruce for the campaign of Bannockburn. Perhaps the general effect of the book may be best described by saying that it is all background, and for the most part very admirable background: it is done almost as well as the gathering of the countrymen in the seventh book of the *Æneid*, when Ascanius has killed the pet deer: Only we should hardly like the *Æneid* so well if it were an aggregate of amplifications of similar passages, and there are no lines in the *Æneid* so bald, for example, as these:

"When none were there,
Oft she disported 'mong the timorous tribe,
Her glorious breasts ploughing the brine aside."

But perhaps this is due to the fact that English *ottava rima* is an inferior metre to Latin hexameter. The merits of Mr. Austin's manner are hardly of a kind to which quotation can do justice. Copiousness, energy, directness, manliness, insight enough for picturesqueness, rapidity enough to pass for grace, tell upon an open-minded reader; but perhaps they take several pages to produce their full effect. It may be doubted whether Mr. Austin's verse has the charm of the best contemporary work, but it might not be hard to maintain, if anyone found such a thesis interesting, that the manner of Byron and the Italians of whom Mr. Austin aspires to be a continuator is upon the whole a finer, more solid, more masculine manner than that which prevails now under the influence of Keats and Tennyson. Perhaps it is a proof of the proverb *il faut être de son siècle*, that though Mr. Austin's general manner is much more direct than, shall we say, Mr. Browning's, yet he always seems to be driven to periphrases, which read like translations from the *Gradus*, whenever he has to write of guns and cannon. The interspersed lyrics are not very fortunate: they look rather as if the fervour with which they were composed had taken the place (for the composer) of the inspiration which would have roused an unsympathetic reader. The first, for instance, looks as if the writer had had the "Isles of Greece" in his mind, and the reader is liable to have "By cool Siloam's shady rill" in his.

Perhaps it would be easier for readers to find the author's fervour contagious if the events of the last twelve or fifteen years in Italy were distant enough to be taken *au grand sérieux*: at present one has to protect oneself against the *incredulus odi* frame of mind when Mr. Austin describes the muster to Mentana as a national uprising, by reflecting that Italy is the native country of the opera, and that Garibaldi's *troupe* would probably have been larger if Victor Emmanuel had not been induced at last to deceive Garibaldi rather than Napoleon III., and so make

some show of performing a solemn and recent engagement. Still it is a relief to turn to the inner circle of Mazzinian devotees who failed, from the frothy royalist and parliamentary movement which for the present has succeeded.

The author of *The Disciples* and *Aspromonte* was set apart to be the laureate of this new church by its founder. Her literary qualifications for the office scarcely go beyond a cultivated fluency of expression which is sometimes a little over-subtle and often degenerates into baldness; but she has a higher qualification in her unwavering faith and sustained intensity of feeling that would make us forget, if anything could, how improbable it is that the church will long survive the founder. The doctrine bore far more traces than an outsider would expect of the catholic soil out of which it grew, especially in the tendency to glorify suffering, and yet more in the passionate unreasoning transport of conviction with which it was embraced; and it has already accomplished enough for good or evil to show how suicidal is the arrogance of the fashionable dogmatism which attacks consecrated traditions upon the mad supposition that the mass of mankind can ever be got to act seriously upon the sum or balance of the evidence actually accessible on important subjects.

The book consists of five parts: there was to have been a sixth, which is left unfinished, owing to the writer's ill-health. The first is an overture, which is very pathetic, as the following extract will show:—

"And now I speak not with the bird's free voice,

But as the swan (who has passed through the spring
And found it snows still in the white North-land,
And over perilous wilds of Northern seas,
White wings above the white and wintry waves,
Has won, through night and battle of the blasts
Breathless, alone, without one note or cry)
Sinks into summer by a land at last;
And knows his wings are broken, and the floods
Will bear him with them whither God shall will;—
And knows he has one hour between the tides;—
And sees the salt and silent marshes spread
Before him outward to the shiny sea,
Whereon was never any music heard."

The close is touching also, but reads too much like a half confidence, to which those who know the writer would have the key.

The first of the disciples is Jacopo Ruffini, who killed himself in prison because he believed that he was being dosed with atropin to weaken his will to resist the pressure put upon him to give up Mazzini's name. The second is Ugo Bassi, a Barnabite, who had a success as a minor Savonarola, then drifted into a mystical Socinianism and other heterodoxy, and during the siege of Rome attached himself to Garibaldi as his chaplain, and followed him on the Quixotic expedition after the surrender of the city, which some will find admirable, some childish, some criminal, all pitiful, in which 5,000 men were gradually reduced by desertion and capitulation to 300. Ugo Bassi followed to the last, and was shot, after being flogged, for boasting of his knowledge of Garibaldi's hiding-place, and his resolution to conceal it. This story takes up most of the volume, and is made longer by many admirable Browningesque descriptions of Italian scenery, assigned with little regard to dramatic fitness some-

times to Ugo Bassi, sometimes to the imaginary narrator, a lay brother who followed him in his apostasy as Sancho Panza followed Don Quixote, only more uncritically.

The other two disciples are Agesilao Milano, who tried to stab King Bomba, and informed the authorities that he was one of a band of a hundred all sworn to the same attempt (which none of them made), and Baron Giovanni Nicotera, who made a hopeless raid on Salerno, and was condemned, with eighty companions, to the *ergastolo*, as he refused to make even the mildest submission. This reminds us that the motto "No terms with tyrants" has latterly done quite as much to exasperate political strife as the motto "No faith with heretics" ever did to exasperate religious strife. A higher impression of the imaginative power of the writer is given by the objective truthfulness of the glimpses she gives us of her master, helping us to understand how he could be regarded by some as a heartless charlatan, by others as an inspired saint. Altogether *The Disciples* is a volume of great though esoteric interest.

G. A. SIMCOX.

The Life of Charles Dickens. By John Forster. Vol. III. (Chapman & Hall, 1874.)

MR. FORSTER'S *Life of Dickens*, now completed in the third volume, is a thoroughly successful picture of the life of the great humourist, and an invaluable aid to the attempt to estimate his genius. It was objected to Mr. Forster's earlier volumes, that he himself occupied too prominent a place in the narrative, and that he did not represent his friend in the most amiable and pleasing light. But it is not easy to see how the biographer could have obtruded himself less. An attachment so close, so long, and so unbroken, is perhaps unparalleled in the annals of literary friendships. There was no moment in the life of Dickens in which he did not appeal to Mr. Forster as to another self. Whether it was a question of putting off a dinner-party, or of going to America, of changing the name of a character, or of changing his domestic relations, or of giving public readings—these two last steps Mr. Dickens spoke of as the Plunge and the Dash—his constant cry to Mr. Forster was "advise, advise!" It was not possible to tell the story of the one life without admitting something of the other. Then as to the keenness, the hardness, the masterful side of Mr. Dickens' character, his restlessness, his uneasy endurance of society, his too lofty estimate of the importance of himself and his affairs, all these are easily accounted for by the story of a life which made such blemishes almost fatal. Thus Mr. Forster's book is an *apologia* for the life, and for the genius, with its defects. For the genius of Dickens, immense as it was, cannot be absolved from criticism, as Mr. Forster almost seems to wish. It is true that since Shakespeare there has lived no writer with such a power of comic invention, or gifted with such swift and sure observation; no one who has given us all so many new friends—and so many new butts—no one whose words have become so much a part of the language, and whose works have been so universally "a truce with sorrows, and forgetfulness of evils." And it was not the springs of

laughter only that he touched. It has been fashionable to sneer at the pathos of Dickens; and here there is no doubt that his skill was not so sure as in comedy—that he was somewhat too tragic. His friend Mrs. Marcet did not need to be what he calls “devilish cute” to guess that Paul Dombey would die, and he was always too easily tempted to a massacre of the innocents of his tales. But tragedy that, at its best moments, stirred Jeffrey and the generous Thackeray as deeply as it did the miners of Nevada, has the element of universality, and is as immortal as his comedy. “Who can listen,” as Thackeray said, “to objections to such books as these? They seem to me a national benefit, and to every man or woman who reads them, a personal kindness.”

Yet objections there were—“critical cant,” Mr. Forster would say—but not wanting in truth. Mr. Forster is very angry with these criticisms, and seems to attribute Mr. Lewes’ rather lumbering review to personal feeling. If he happens to remember the advice which the author of *Ranthorpe* dealt so freely to the author of *Jane Eyre*, he will find that Mr. Lewes could be very candid, without being at all unfriendly. Yet it cannot be denied that some of the detractors of Mr. Dickens were moved by his extraordinary popularity. There are critics to whom popularity and vulgarity seem synonymous. But there were other and more valid reasons why educated opinion should often be at variance with popular opinion about the works of Mr. Dickens. Thackeray says that no class of people speak so little of books, or read them so little, as those who write them. Mr. Dickens was an extreme instance of this saying. “He was not a bookish man,” observes Mr. Forster. Of all great writers, he was the least interested in books, and in the human world which lives in literature. His discovery that Mr. Tennyson was “a great creature,” even recalls Mr. Robert Buchanan’s high opinion of “that tremendous creature, Dante.” Now, “the fellows who have failed in literature and art,” are generally “bookish men.” And they felt a want in Dickens; he was not of their world; his marvellous powers of observation had never been exercised apparently on the sort of people they knew best. More than that, the whole atmosphere of literature and of tradition, the air that admits such fair perspectives and suffers all objects to blend so softly, that smoothes hard edges, and makes the mind inapt to form crude opinions, all this climate of letters did not qualify his vision, or give tone to his genius. He saw things clearly indeed, but just as they were given; he did not recognise them as parts of a whole, as moments in the passing of a world. His very impatience of society was an instance of this. People sneered at Goethe and at Scott for their subservience to society and its rulers, but theirs was a more tenable position than that of Mr. Dickens. “He would take as much pains to keep out of the houses of the great as others take to get into them.” “The inequalities of rank, which he secretly resented, took more galling as well as glaring prominence from the contrast of the necessities he had gone through, with the fame which had come to him.” These words contain

the explanation of almost all that is least happy in Mr. Dickens’ novels, such as his absurd caricature of the Dedlocks, and indeed of society generally, and of the bitterness that was the worse side of his real enthusiasm for the cause of the poor. That enthusiasm and indignation showed itself in his life and works, as well as in his writings. No one was more nobly intolerant of the “cant about the cant of philanthropy.” He spoke bravely and truly, but he spoke, as Mr. Ruskin admits, “from a circle of stage fire.” Thus, on every side, Mr. Dickens’ genius was most limited, just where people who are nothing if not critical, suffer least from limitations. They know their world, and take it as they find it. In some ways Mr. Dickens did not know it, and he was determined not to take it as he found it. And so, with little blame to him, his genius was less delightful than it might have been.

Of course there were other objections. Invention was not invariably to him “the easiest thing in the world,” and then he took refuge in a fantastic imitation of himself. One of the gifts of his intense vitality was his power of investing inanimate things with life and character. But it was very easy to work this vein too far. Everyone grew tired of his singing kettles, and frowning door-knockers, and benevolent clocks. This, with his other habit of insisting on some trick of speech or manner, till Carker’s teeth grew as terrible as those of the Lady Ligeia in Poe’s tale, and till the East Wind of Mr. Jarndyce was even more detestable than Mr. Kingsley’s “Wind of God,” was taken up and repeated by a school of imitators. And unfortunately it was only too easy to imitate the Inimitable, as he liked to call himself. There were many Gigadibses in the field, who, if they did not “write stately for *Blackwood’s Magazine*,” at least produced sketches “we almost took for the true Dickens.” Besides, critics who have had their day and their philosophies are but little allured by what Mr. Dickens called “*Christmas Carol* philosophy”—“a vein of glowing, hearty, generous, mirthful, beaming reference in everything to Home and Fireside.” In this system of Ethics, virtue was as closely associated with punch, as oysters, in Mr. Weller’s doctrine, with poverty. Still the stern fact had to be faced, that Mr. Forster was no punch-drinker, and Mr. Dickens could not think of him as using the “green glass,” which it seems the truly good and wise quaff out of. But, after all, which of our philosophies is quite complete? They have their day, and cease to be, and even *Carol* philosophy has its inadequate moments.

This cheerfulness gave pain to many cultivated minds. And so out of reaction, envy if you please, against this wonderful popularity of Dickens, out of annoyance at his tricks and affectations, at his worshippers and his imitators, there arose objections enough to furnish weapons to a school of hostile critics. The first volume of the *Life of Dickens* seemed to increase this hostility. There were people who failed to see that the keenness, the vanity, the defects in culture of Mr. Dickens, were only the scanty results for evil of so bitter a youth,

so hard a training, acting on the most delicately sensitive organisation and character.

We speak of the limitations of Mr. Dickens, of his want of connection with the literary and social forces of the world. We contrast this with the culture of Goethe, the wonderful goodness and humanity of Scott, the urbane art of Thackeray. And then Mr. Forster’s first two volumes explain these limitations, and leave the stranger marvel that Dickens still could deserve these words of Mr. Carlyle, “a most cordial, sincere, clear-sighted, quietly-decisive, just, and loving man.” These volumes are fading from memory now. We scarcely remember, we scarcely keep vividly enough before us, the bitter painfulness of his childhood. He was born “between the middle-class and the low.” His father, who was certainly no *épiciér*, treated him with a judicious neglect like that which the elder Mr. Weller bestowed on the education of Samuel. He was a wonderful child, the original of all the elfish children of his stories. How his childhood was blighted, all its squalor and misery, the world has read of in *David Copperfield*. From the meanest duties he went to the slenderest commercial and classical education, thence to a lawyer’s desk, to the reporter’s gallery, to literature. Contrast this childhood and youth with Scott’s nurture in a land of old romance, in the twilight and decay of a world of stories. Contrast it with Goethe’s boyhood, amidst the grave homeliness of Frankfort, within sound of the first murmurs of the revolution. Compare it, again, with the youth of Turner; it was scarcely less squalid—the genius that was repressed was as keen, the sudden popularity was far greater and more intoxicating, and then we can only wonder that the life of the great humourist was so generous, so hearty, and unspoiled. In his triumphant progress through England and America he must have felt that he was indeed what the Roman Emperor was called, “the darling of the human race.” To say that throughout life “he was rather admired than loved by those with whom he had business dealings,” that he was sometimes absurdly pompous and self-conscious, is only to say that he was human.

Mr. Forster’s earlier volumes explained much of the defects in Mr. Dickens’ genius by the misfortunes of his youth. The misfortune of his later age, the constant excitement which that intense life of eternal watchfulness of men and things produced, goes far to account for his later strained and “tormented” style. Beside this restless excitability, there were domestic troubles of which he let the world hear too much, and of which Mr. Forster tells no more. The interest of the volume is a melancholy one. There are the usual letters, some written from abroad, with even more than his usual humour and fluency; there is a comic fragment from the unfinished *Edwin Drood*, introducing an auctioneer, a pompous fool of the Pumblechook variety, and there is an allusion to the misunderstanding with Leigh Hunt. Mr. Dickens had attributed his friend’s manner and ways to the effeminate parasite Harold Skimpole, and Hunt was naturally annoyed. It certainly was not a

pleasant liberty to take, and Dickens had of course to fear no such reprisals as Thackeray might very well have looked for from the fire-eating original of the O'Mulligan. There are also references to Dickens' notion that he possessed magnetic powers, which he once used to send Mr. John Leech to sleep, and that strange coincidences happened to him. Goethe had the same belief about himself, and a story is told of a dream of Shelley's which is a complete parallel to a dream of Dickens' reported here. It is odd that, since Mr. Dickens' death, he has been reported as appearing to mediums a good deal; an instance will be found in the collection of the Dialectical Society. His American experiences only add to the melancholy interest of the book—the spectacle of a man of the greatest genius so bereft of any “city of the mind” that he is driven to seek excitement and even repose in constant change of work, change of scene, and of applauding crowds. He was always haunted with a vague sense of something lost, something missed; he could never “retire within himself and be quiet at the last;” he gave his whole energy to the task of public readings from his works. The success flattered his early love of the stage; he enjoyed a new kind of power, that of sending women into fainting fits with the murder scene in *Oliver Twist*. He had the opportunity also of making a considerable fortune in an unprecedentedly short time. No man, as Mr. Forster says, cared less for money; and it cannot be doubted that his real motive for these exertions was the search for repose in counter-excitement, and something of the feeling that there was a match between the strength of his will and the strength of his constitution. The latter gave him many warnings before it broke down, but most happily when it *did* give way, it was decisively. There were no terrible years of helplessness, like those that Lockhart had to witness in the case of Scott. Dickens passed away almost as suddenly and quietly as Thackeray fell asleep. As one finishes the record of his life, it is impossible not to be thankful that the life of his great and generous rival has been spared by the biographer. It is good to know what we do of Dickens. The keen student of human nature wished that his own story should be told in full. But we trust that his works, his confidants in all moments, wherein he confessed so frankly his own weaknesses and defects, may be allowed to be the only biography of the humane and noble Thackeray.

A. LANG.

The Life and Death of John of Barneveld, Advocate of Holland; with a View of the Primary Causes and Movements of the Thirty Years' War. By John Lothrop Motley, D.C.L., LL.D. (London: Murray, 1874.)

(Second Notice.)

IN the part of his work which relates to the religious struggle which ended with the execution of Barneveld, we have Mr. Motley at his best. A Philip of Spain, an Alva, a Maximilian of Bavaria, are so intensely repugnant to him that he evidently takes no pains to penetrate beneath the surface, or to picture forth for himself, or for his readers,

the aspect which the events of the world bore in their eyes. But the two great leaders of the Dutch Republic—Barneveld the statesman, and Maurice the soldier—have been alike the objects of his sympathetic pen. The strife which kept them apart rises into tragic pathos in his hands, because he loves and honours both, and because he believes that the quarrel was equally unnecessary and harmful. As we read on, we almost feel as if we were witnesses of some tale of Thebes or Argos in which the good will of individuals is borne down by overwhelming external power, though, as in all true history, the modern idea of causation has to be substituted for the Greek idea of fate.

Rarely, in all his writings, has Mr. Motley's personality come out so distinctly. We feel him eager, if it were possible, to break through the distance of time, and to stretch out his hand to stay the progress of the mischief. And we may be sure that if he could have been at the Hague in 1618—that sad year of Maurice's *coup d'état*—he would not have contented himself with murmuring “Peace! peace!” after the fashion of a grave, philosophic Falkland, but would have stepped between the combatants to speak to him who was the first to draw the sword, as the Homeric Pallas spoke to the Maurice of the Grecian camp, when she told him that she had come—

παύσασα τὸν μένος αἶ κε πύθηναι,
οὐρανόθεν· τρὸ δὲ μ' ἦκε θεὰ λευκώλενος Ἥρη,
ἄμω ὁμῶς θυμῷ φιλοῦσά τε, κηδομένη τε.
ἀλλ' ἄγε, λήγ' ἔριδος, μηδὲ ξίφος ἔλκεο χειρὶ.

A question going deeply into the never-ending dispute about the limitations upon the relative functions of Church and State cannot fail to be more interesting at the present day than a question concerning the succession to territories in Germany, important as that succession was in the seventeenth century. And the quarrel between Barneveld and Maurice has, besides, a special interest for students of English history. In England, the reaction against Calvinistic dogmatism was so closely connected with the ceremonialism of the Laudian school of divines that to this day it has hardly received from historians the attention which is due to it. In the Netherlands the reaction was purely dogmatic, and we are, therefore, able to trace the progress of the conflict uninfluenced by any special dislike of this or that form of ceremonial observance.

If we have a fault to find with Mr. Motley, it is that his impartiality makes him too devoid of sympathy—not for the persons implicated, for with them he is sympathetic enough; but for the parties in the strife. Like the Roman sitting on his tribunal amidst the seething mob torn by religious animosity, the very meaning of which he is utterly unable to comprehend, he cares for none of these things. It evidently seems to him to be so utterly absurd that men should come to blows about so abstruse a subject as Predestination, that he scarcely thinks it worth while to consider what Calvinism meant to the men of the sixteenth and seventeenth centuries, except so far as he sees that it gave them vigour in their conflict with the Catholic powers. Yet it is hardly too much to say that Calvinism

saved Europe from moral anarchy as well as from Papal tyranny.

With all Luther's nobleness and greatness of soul, Lutheranism showed signs of weakness almost from the commencement. Luther's great achievement was not so much to introduce a new doctrine as to reverse the poles of religious thought. Justification by faith meant that the individual and not the Church came first: and the consequences were not slow to follow. When the old framework of religious life and doctrine had been broken down, each man was apt to claim the right of choosing for himself his own way of life. Each man went to the Scriptures for himself. There the leaders of the Peasants' insurrection found the reversal of the social constitution of the world around them. There the Anabaptists found polygamy and a community of goods. Luther, tolerant of diversity of opinion as far as tolerance was possible, struggled against these things, and relied, when the sense of Scripture was doubtful, upon the authority of the magistrates. But magistrates are but a sandy foundation on which to build. In a few years the Landgrave of Hesse, himself a magistrate if ever there was one, married two wives at once, because David was not content with one. Then came Maurice of Saxony making a gain of godliness, and turning the holy cause of Protestantism into a means for ministering to his own ambition.

From all this the men to whom religion was more than a creed were delivered by Calvin. Predestination was as truly Protestant as justification by faith. It placed the individual first, the Church second. Upon this foundation was built a whole system of dogmatic theology, and no less dogmatic discipline. The spring of individual energy was left untouched for the Calvinist. If he was predestinated to life, he was predestinated by the Divine decree. No priesthood, no ceremonial observance, no intervention of the whole human race, could make him better or worse than he was. Yet every step in his life was bound down as strictly as the most rigid disciplinarian could desire. Speaking in the name of the Divine law, the great Calvin had settled for him how he was to think and how he was to act. There was to be no searching the Scriptures for him, to see whether he might not take half a hundred wives, or claim a community of goods with the wealthy ship-owners of Amsterdam. There was once more a definite habitation of moral law and order which he could healthily occupy, because he believed it to be the building, not of Calvin, but of One higher than Calvin.

The time was come, in the days when Barneveld was old, when all this must be changed. The battle had been sufficiently won, morally and physically, for the Lutheran spirit to return with its wider tolerance and its greater reverence for political as distinguished from ecclesiastical authority. The leaders of Continental Protestantism in the sixteenth century, Coligny and William of Orange, were Calvinists. Its leaders in the seventeenth century, Barneveld and Gustavus, were not Calvinists. Yet the change, good as it was, would not come without evil in its train. There would be a violent

shaking of ancient faith, much distraction of weaker minds, much moral decadence in those whose reliance was rather upon rules of life generally acknowledged than upon the essence of those rules.

We once met with a story told by the Swiss deputies to the Synod of Dort, which will illustrate our meaning. A peasant was struggling with an unruly horse. "Go on," he said, "you are an Arminian; you want to have a will of your own." Ridiculous as this looks, it was not without a meaning. The Catholic framework of life was gone. If the Calvinist framework of life was to go too, would not everyone wish to have a will of his own? The sense of being confined by an orderly system, that feeling which the modern scientific man draws from his contemplation of the order of the universe, would be gone, and there would be nothing left but the rule that each man was to go his way, according to his lights, and that, in the last resort, the magistrates were to decide for him what he was to do.

It seems to us, therefore, that to do full justice alike to Barneveld and to Maurice, it is necessary to bear in mind, far more than Mr. Motley is disposed to do, the infinite ramifications with which the driest religious creed penetrates the very core of moral life. To Mr. Motley a dispute about Predestination and Freewill is something like a dispute about the possibility of squaring the circle, which he would willingly leave, as Milton did, to those fallen angels who had more time on their hands than they knew what to do with. But, after all, this fault, if it is a fault at all, is merely one of omission, which each reader can correct for himself, according to his knowledge or feeling. In the account which he gives of the facts of the struggle, Mr. Motley is impartiality itself.

The facts are briefly these. In two of the seven provinces, Holland and Utrecht, Arminianism got the upper hand, at least with the self-elected boards of magistrates which sent deputies to the Provincial Estates. Even here, however, the Calvinist creed had a strong popular following, and in some cities, and especially in the great commercial centre, Amsterdam, it had the magistrates on its side. On the whole, the upper mercantile classes were Arminian—the mass of the people was Calvinist.

Under these circumstances the policy pursued by Barneveld seems to have been a wise one, if only it had been practicable. In the name of the States of Holland he proclaimed—the States of Utrecht following his lead—that the question at issue was not sufficient to break through the bonds of Church union, and that there was no reason why Calvinists and Arminians should not occupy the same pulpits and join in the same worship.

Undoubtedly such a policy as this was a great advance upon the strict dogmatic orthodoxy of the Calvinists, who resented every attack upon their doctrine of Predestination as an attack upon religion itself. But, whether we like it or not, this feeling of the Calvinists existed, and whilst our judgment of Barneveld as a thinker may be altogether in his favour, our judgment of him as a statesman will depend very much on the way in which he met this indubitable fact.

The point on Barneveld's side is that he

represented the returning feeling in favour of the supremacy of the State over clerical supremacy. He stood up for freedom of thought and teaching over narrow orthodoxy. But the moment he had to do with a clergy and people who did not want freedom of thought, and who did want clerical supremacy, he came into collision with another point of the creed of the future—the right of religious liberty for the unwise and foolish, as well as for the wise and prudent.

Let Mr. Motley be heard (i. 341) as to the form which Barneveld's moderation took when his party was in power:—

"Where the Remonstrants," i.e. the Arminians, "were in the ascendant, they excited the hatred and disgust of the orthodox by their overbearing determination to carry their Five Points. A broker in Rotterdam of the Contra-Remonstrant," i.e. the Calvinist, "persuasion, being about to take a wife, swore he had rather be married by a pig than a parson. For this sparkling epigram he was punished by the Remonstrant magistracy with loss of his citizenship for a year, and the right to practise his trade for life. A casuistical tinker, expressing himself violently in the same city against the Five Points, and disrespectfully towards the magistrates for tolerating them, was banished from the town. A printer in the neighbourhood, disgusted with these and similar efforts of tyranny on the part of the dominant party, thrust a couple of lines of doggerel into the lottery:

'In name of Prince of Orange, I ask once and again,
What difference between the Inquisition of Rotterdam and Spain?'

For this poetical effort the printer was sentenced to forfeit the prize that he had drawn in the lottery, and to be kept in prison on bread and water for a fortnight."

"The demon of intolerance," as Mr. Motley observes, "had taken possession of both parties in the Reformed Church." In 1616 the final step was taken which made it necessary to settle the question one way or other. "Henry Rosaens, an eloquent divine" (i. 343), was a preacher at the Hague. He might have preached Calvinism as long as he pleased without suffering any harm from Barneveld. But he "refused all communion" with his Arminian colleague, "and was, in consequence, suspended."

"Excluded from the Great Church, where he had formerly ministered, he preached every Sunday at Ryswyk, two or three miles distant. Seven hundred Contra-Remonstrants of the Hague followed their beloved pastor, and, as the roads to Ryswyk were muddy and sloppy in winter, acquired the unsavoury nickname of the 'Mud Beggars.' The vulgarity of heart which suggested the appellation does not inspire to-day great sympathy with the Remonstrant party, even if one were inclined to admit, what is not the fact, that they represented the cause of religious equality. For even the illustrious Grotius was at that very moment repudiating the notion that there could be two religions in one State. 'Difference in public worship,' he said, 'was in kingdoms pernicious, but in free commonwealths in the highest degree destructive.'"

The issue was thus plainly put. If there is to be but one Church, is it to be the liberal Church of Barneveld and Grotius, or the dogmatic Church of Rosaens and Maurice? Our heart, like Mr. Motley's, is with Barneveld; our judgment is, if not with Maurice, with his excellent cousin William Lewis, who consented to the revolution which swept Barneveld's power away, but who would gladly have spared his life.

Historical experience since the days of Barneveld has shown us that there are only two processes by which a religious minority can acquire toleration or liberty in the face of a religious majority. On the one hand, it may avail itself of the force of circumstances, as English Protestantism did in the days of Elizabeth, to convert itself into a majority, or at least to win over to its side the support of that numerous class who are more or less indifferent. On the other hand, it may sue *in forma pauperis*, as nonconformity did in the days of William III. It may show that its existence is not dangerous, and that its co-operation will be profitable to the governing powers. But it may safely be said that for a minority to claim to be the governing power, to mete out, at its own will, the amount of consideration to be paid to the majority, is to enter upon an impracticable path, unless indeed the minority of mere numbers be a majority of those who, by their intelligence, or by the fact that they are armed, whilst others are unarmed, dispose of the destinies of the nation.

Hence the question arises, What is the nation, what is the State? Was the Province of Holland alone concerned in the matter? Or had the Arminians of Holland to take account of the feeling of the other States? Mr. Motley, fresh from the constitutional disputes which preceded the American Civil War, enters into the examination of this question with full knowledge. The Provincial governments, he shows, had the constitutional right of deciding on religious matters within each State, just as, we may add, legislation on religious matters is reserved to the separate States of the German empire at the present day. But he also shows that, in the struggle against Spain, the idea of the unity of the Republic had been gaining the upper hand. The law was on the side of Barneveld; the national feeling was on the side of Maurice.

When this has once been said, there is little else to be done but to read the masterly pages in which Mr. Motley tells the story of the tragedy which followed with thorough enjoyment—such enjoyment, at least, as is consistent with the emotions resulting from such a tale of sorrow. To those who, with Mr. Motley, are absorbed in the contemplation of the tragic scene before them, the impression left by Barneveld's overthrow and judicial assassination will be one of unmitigated distress. But those who will take a wider view of the events which have passed in the world, and to whom the *refrain* with which the poet of old entered upon the contemplation of the saddest of the old tales of Greece—

αἰώνον αἰώνον ἐπὶ, τὸ δ' εὖ νικᾷτω—

is the keynote of so much of history, may look beyond the scaffold of the Hague to a wider prospect. They will acknowledge that, just as in England the chances of religious liberty were enormously increased by the revolution which, in establishing Charles II. on the throne, gave at last the right of persecution into the hands of a majority; so the chances of religious liberty in the Netherlands were enormously increased by the revolution which gave the same right to the majority. The new creed would come in humbly with its demands for toleration or

liberty. It would not place itself in the seat of government, like Puritanism in the days of Cromwell; laying down the law, however wisely, on the religious position of its opponents.

Why cannot Mr. Motley tell us this great story of the foundation of religious liberty in the Netherlands? As he passes into the Stadholderate of Frederick Henry, and beyond that again into the days when resistance to France took the place of resistance to Spain, his merits as a writer would be on the increase, his defects would be less and less seen, as he felt the atmosphere of the thought of the eighteenth and nineteenth centuries near him.

Unhappily, Mr. Motley has been seized by a desire to leave his proper work in order to write the History of the Thirty Years' War. Unhappily, too, if he is to write it upon the lines of the sketch included in the present volumes, he will be the author of a book which can only serve to detract seriously from his well-earned reputation.

If there is one thing more than another clearly brought out by modern investigation, it is the way in which reverence for the federal government of the Empire checked the feeling of Protestants against Catholics from taking full effect, and strengthened the feeling of the Catholics against the Protestants, through the belief that they were themselves the guardians of political as well as of spiritual order.

Of all this, with its incalculable results, Mr. Motley knows nothing. He sees nothing but persecuting Catholics, and Protestants stupidly waiting till their turn comes to be persecuted. The Princes of the Empire are with him "Sovereign States," a name which would have been repudiated as much by John George of Saxony as by Maximilian of Bavaria. And of the doings of these Sovereign States Mr. Motley has some very queer things to tell us. What, for instance, can we possibly make out of the following (i. 39)?—

"The union of Protestantism, subscribed by a large proportion of its three hundred and seven sovereigns, ran zigzag through the country."

Mr. Motley should really have given us the date and place of this wonderful subscription. The poor little Union of Ahausen, subscribed by rather more than a dozen princes and cities, can hardly be meant, and any larger union may safely be relegated to the domain of "things not generally known."

Mr. Motley's most astonishing mistakes, however, relate to the history of Bohemia, which is the more remarkable as he is perpetually quoting Gindely, and speaks of him as a "great historian" (ii. 96), and as a writer (ii. 105) of "learned and powerful works" which leave little to be desired. Mr. Motley, it would seem, shows his respect by rejecting, without comment, many of the conclusions at which Gindely had arrived. Readers of Gindely's books will remember, doubtless, what pains he takes to show that Matthias was elected King of Bohemia, and that Ferdinand was accepted as the hereditary king. Mr. Motley carelessly speaks of Matthias as accepted (i. 261), and of Ferdinand as elected (ii. 86, 88). Nor is this a mere matter of wording. The fact that the majority of the Protestant

Bohemian estates acknowledged that the crown of Bohemia descended by hereditary right upon Ferdinand, is one of Gindely's great discoveries. Mr. Motley may produce evidence against it, if he can, but he has no right to refer perpetually to Gindely, and to treat the discovery as if it had never been made. Of course it would be an awkward fact for Mr. Motley, as it would force him to take another tone about Ferdinand's pretensions, after the revolution of 1618.

But such a mistake, serious as it is, is outdone by Mr. Motley's ignorance of things which every German schoolboy knows. We thought that everybody who had even superficially dipped into the history of the Thirty Years' War, knew that the Majesty-Letter (*Majestätsbrief*) was a contract between Rudolph, as King of Bohemia, with his Bohemian subjects, not as Emperor with what Mr. Motley calls the Sovereign States of the Empire. Mr. Motley thinks otherwise. "Thus," he writes (ii. 21):—

"There might still be peace in Germany, and religious equality as guaranteed by the Majesty-Letter and the Compromise," i.e. an additional act of the Bohemian Legislature explanatory of the Majesty-Letter, "between the two great Churches, Roman and Reformed, should be maintained."

And still more explicitly in speaking (ii. 24) of "the laws and privileges of the Empire" that:—

"Among these laws were the great statutes of 1609 and 1610, the Majesty-Letter and the Compromise, granting full right of religious worship to the Protestants of the Hapsburg monarchy."

Mr. Motley, in fact, commits himself to the propositions that a purely Bohemian law formed part of the "laws and privileges of the Empire," and that, whether as a law of the Empire or as a law of Bohemia, it somehow or another granted rights to "the Protestants of the Hapsburg monarchy." Does Mr. Motley seriously think that a Protestant in Hungary, for example, would be in any way affected by legislation either at Prague or at an Imperial Diet? What would he think of an Englishman writing on the late war in his own country who gravely asserted that some act of the Legislature of Alabama formed part of the federal legislation of the United States' Congress, and was binding on all persons within the Confederate States?

It is with unfeigned regret that all who value Mr. Motley's work in his own sphere will see that he is despising the difficulties of a subject on which his knowledge is extremely limited. We feel very much towards his projected enterprise, as the engineer felt who reported on the terrible accident on the South-Western Railway last summer, in which a bullock got in the way of the train. Either the train, he said, if possible, should have been brought to a dead stop, or, if that was not possible, it should have been pushed on at full speed. We had rather that Mr. Motley should bring his train to a full stop, and return to his old line. But if that is not to be hoped, we trust that he will push on at full speed. The real history of the Thirty Years' War is one which it will probably take the lifetime of many men to investigate thoroughly; and it would be a pity if Mr. Motley were to occupy much time in laboriously acquiring knowledge to which he has not as yet found

the key. If Mr. Motley can be induced to continue to treat the subject as a mere episode deserving no serious study, he may possibly write a book as full of mistakes as those which we have signalled, and may then, after wasting three or four years of his valuable life, come back to that special work in which he stands alone, and in relation to which even those who venture to criticise him are aware that they stand in the relation of scholars to a master.

SAMUEL R. GARDINER.

Japan and the Japanese. By Aimé Humbert, late Envoy Extraordinary of the Swiss Confederation; translated from the French by Mrs. Cashel Hoey, and edited by H. W. Bates, Assistant-Secretary R. G. S. (London: R. Bentley & Son, 1874.)

We have read this handsome but unwieldy quarto with mingled feelings of disappointment and interest. We are disappointed because, judging from the two titles of the work, *Manners and Customs of the Japanese*, and *Japan and the Japanese*—which, we may remark, appear only on the cover and the title-page respectively, and thenceforward give place to that of *Life in Japan*—we hoped that we had at last met with a book in which we should find, lucidly set forth, a comprehensive and systematic account of the social life of the Japanese at the present day. Such a book, however, has still to be written; and in view of the important changes which have taken place within the last few years amongst that singular people, we feel sure that, when written, its appearance will be hailed with satisfaction by all whose attention has from any cause been seriously attracted to that portion of the Far East. Although M. Humbert's work has not fulfilled the expectations which we formed of it, its contents are, nevertheless, for the most part very interesting, and we much regret that he did not see the necessity of compressing his materials, and arranging them in a more judicious manner. He divides his subject into four books, to which he gives the following names:—(1) Benten, a portion of the Japanese city of Yokohama, which gets its name from a sea-goddess; (2) Kioto, the ancient capital of the Mikados; (3) Kamakoura, the former residence of the Siogouns; and (4) Yeddo, which town was made the political capital of Japan by the usurping Siogoun Iyéyas, at the commencement of the seventeenth century.

The Empire of Japan is said to comprise no less than 3,850 islands or islets, of which Japan, properly so called, comprehends 3,511; the four chief islands being Nippon, Kiousiou, Sikoff, and Yezo, and the remainder, for the most part, mere specks on the ocean. The population of the entire Empire was ten years ago estimated at nearly thirty-four millions.

The far-famed Inland Sea, which is more like a canal than a Mediterranean Sea, is bounded on the north by the coast of Nippon, and on the south by Kiousiou and Sikoff, and connects the Strait of Corea with the main ocean. The scenery of this sea varies considerably:—

"There are grand marine scenes, where the lines of the sea blend with sandy beaches, sleeping

under the golden rays of the sun; while in the distance the misty mountains form a dim background. There are little landscapes, very clear, trim, and modest; a village at the back of a peaceful bay, surrounded by green fields, over which towers a forest of pines;

and sometimes the traveller is reminded of well-known spots on the Rhine. On the voyage to Yokohama, Fousi-yama, the "Matchless Mountain," an extinct volcano, 12,450 feet above the sea level, is sighted; and, capped as it is with eternal snows, imparts inexpressible grandeur to the scene.

Having established himself at Yokohama, M. Humbert proceeds to "take notes," and he gives us some interesting information respecting the two-sworded "Yakounines," the dwellings of the people (in which the absence of furniture will seem odd to the European), their personal appearance, &c.

"The Japanese," he remarks, "without being precisely disproportioned, have generally large heads, rather sunk in the shoulders, wide chests, long bodies, narrow hips, short and thin legs, small feet, and slight and remarkably beautiful hands. Their retreating foreheads and large and prominent cheek-bones make their faces represent the geometrical figure of the trapeze rather than that of the oval."

In the second Book our author proceeds to make some remarks on the origin of the Japanese people, the genesis of Japan, and its early Sovereigns. Kioto, the ancient capital of the Mikados, may be described as an ecclesiastical city, for priests of various ranks form about a tenth part of its population of somewhat over half a million. We must not, however, look upon the holy city as a mere monastic retreat, for we are told that in the days of its prosperity, at any rate, its appearance produced the impression of a never-ending carnival. In this place, until quite recently, the Mikado, the Spiritual Emperor, has for little short of three centuries, been content to remain almost a nonentity as far as real political power is concerned. Some of the customs observed at his Court are curious. The ladies pull out their eyebrows, and replace them by black patches; and those of them who are admitted to the presence of their monarch, being bound to appear as if they were approaching him on bended knees, produce this effect by wearing what seem to be "long trailing trousers"! No noise but that of rustling silk is heard in the palace, which would seem to be the very abode of luxury, and there we learn that the Empress, "called the Kiski, who proudly rules over twelve other legitimate wives of the Mikado and a crowd of his concubines, squats in proud isolation on the top step of the vast dais, which rises above the whole."

We are at a loss to understand why M. Humbert constantly speaks of the Siogoun as the "Taikoun," seeing that, as he himself tells us, the latter title was invented in 1858, when Commodore Perry was negotiating a Treaty on behalf of the United States of America. The word is generally written "Tycoon," and is simply the rendering of two Chinese characters meaning "great prince" or "great chief." It is not very easy to define what was the proper position of these officials, but Kaempfer, writing one hundred and fifty years ago, calls them the "Crown generals and secular monarchs;" and the office would seem to have been

originally a combination of those of commander-in-chief and prime minister. In these capacities the Siogouns administered the affairs of the Empire under the Mikados from the end of the twelfth to the beginning of the seventeenth century, the sons of the Mikados sometimes holding the office. Owing to the constant quarrels amongst the nobles, the power of the Siogouns gradually increased, and Iyéyas, who obtained the office by gross treachery early in the seventeenth century, and established his capital at Yeddo, succeeded in making the Siogounate hereditary in his family. From that time until very recently the Mikado does not seem to have had much voice in the management of his Empire; but now all is changed, and the institutions of the country may be looked upon as in a transition state.

Buddhism was introduced into Japan from Corea in A.D. 552, and soon became very popular, practically displacing the ancient national religion. M. Humbert rightly observes that the influence of the philosophy of final annihilation, inculcated by Buddhism, must not be underrated, for it is owing to this that

"when the Japanese has reached a mature age, he will sacrifice his life and that of his neighbour, with the most disdainful indifference, to the satisfaction of his pride, or to some trifling resentment."

The thousand divinities of Buddhist mythology all took their place in Japan, each with its temples, convents and bonzes, and gradually the competition between these became so vehement, that they eventually resorted to violence and burned one another's temples and convents. Towards the end of the sixteenth century, these quarrels raged so furiously, that the Siogoun, Fidé-Yosi—who had originally been a groom in the service of his predecessor, Nebounanga, and afterwards greatly distinguished himself as General Faxiba—resolved to put a stop to them, once for all.

"He surprised, captured, and occupied the most militant bonze-houses, demolished their defences, transported all the monks, who had broken the public peace, to distant islands, and placed the whole of the Japanese clergy, without distinction, under the superintendence of an active, severe and inexorable police. He enacted that thenceforth the bonzes should enjoy only the usufruct of their lands, the property in them being transferred to the Government, with full and free power of disposal of them."

Having reduced the Buddhists to order, this same Siogoun, the patron of the afterwards celebrated Iyéyas, instituted a violent persecution against the native Christians, in the course of which over 20,000 victims were cruelly butchered, and the foreign missionaries driven out of the country.

For many years it was commonly supposed that Peking and Yeddo were the most populous cities in the world, but this opinion was formed in ignorance of the actual extent of their population. Peking probably contains between half and three-quarters of a million of people, while the inhabitants of Yeddo do not number more than eighteen hundred thousand. Yeddo is a wondrously busy place, and, says M. Humbert,—

"The sound of wooden shoes upon the pavements and upon the sonorous bridges, the bells on the harness of the beasts of burden, the gongs of

the beggars, the cadenced cries of the coolies, and the confused noises which come up from the canal, form a strange harmony, unlike the sounds of any other cities. All great cities have a voice of their own. In London it is like the surge of the rising tide; at Yeddo it is like the murmur of a stream."

Again, he says,—

"In Venice only, among European cities, can this same movement of the people, the same concert of steps, voices, sounds of music, be heard, without anything to trouble its peaceful cadence and its charming harmony. The Ogawa reminds us of the Grand Canal, and the neighbourhood of the bridges of Yeddo is, like the public squares of Venice, the rendezvous of the citizen population. The multitudes who meet each other there every evening, cause no inconvenience whatever; for though Yeddo is, *par excellence*, a city of great dimensions, the Japanese people practise spontaneously that discipline of circulation which our policemen have so much difficulty in establishing in our capitals."

Our author gives some interesting information about social matters in Yeddo, through all the details of which we cannot follow him. He tells us of the curious affection which the Japanese have for their celebrated swords, now rapidly giving place to foreign rifles and pistols, about the famous Hara-kiri (incidentally explaining Heusken's murder), and about the various arts and manufactures of the great city. He tells us, too, that for 1,600 years Confucius has been "universally venerated under the name of Koô-ci, a corruption of the Chinese name Khoun-Tseu" (we were always under the impression that the great sage was called Kung Foo-tsze in his native land!)—and that his writings "have contributed more than anything else to endow Japanese society, not, indeed, with civilisation, but with the civilism in which it takes such pride."

Marriage in Japan, as in China, is purely a civil rite, and the binding part of the ceremony in both countries appears to be the pledging by the couple of each other in their national wine or spirit. The ceremonies, which cause the expenditure of a considerable sum of money, must take place in the presence of witnesses, and it is said that in Japan there is an official registration of the marriage. The domestic solemnities consequent upon death vary according to the rank of the departed, but are always very expensive to the relatives, and the bonzes take part in them. Some of the Japanese funerals' customs are very strange, "incineration" being practised to a certain extent.

The last two chapters of this book—the one added by the author, and the other by the editor—bring the record of Japanese affairs down to 1873, and supply some useful information. The language and monetary system of the country are barely touched upon, though surely both subjects were worthy of notice in a work of such magnitude.

M. Humbert seldom loses an opportunity of saying a word in disparagement of the Chinese, but we cannot help thinking, from various indications, that his acquaintance with their character is not very profound. We do not deny that vice exists in China, as well as in Japan, but in the former country it certainly does not flaunt itself before the public gaze, as it does in the latter; there are no Gankiros in China. Again, our author

admits plainly that his favourite race is given to the consumption of large quantities of *saki*, the consequences of which are very terrible; in this respect the Chinese are infinitely the superiors of the Japanese, for drunken riots are quite unknown in China, and in that country one will probably not see a drunken man in the streets once in the course of a twelvemonth.

M. Humbert's work has some rather serious defects, a grave one being the entire absence of an index, which renders the book quite useless for purposes of reference. Again, the writer displays an extraordinary propensity for breaking out into new paragraphs without any occasion whatever; his style, too, is often very diffuse, and of this defect one example will suffice. Describing a sacred gate called a "Tori," he says "it is composed of two pillars slightly inclined towards each other; so that they would meet at last at an acute angle, if at a certain elevation their pyramidal development were not checked!" At the risk of appearing hypercritical, we think that the translator and editor would have acted more wisely if they had not adopted the French method of spelling Japanese words, for it is very confusing to the English reader.

The illustrations, some 200 in number, which are scattered with a lavish hand throughout the volume, are most interesting, and are generally well executed; in one case, however, through some carelessness, the Chinese inscription is inverted. It is almost a pity that in the arrangement of these illustrations a little more regard has not in some instances been paid to the letterpress of the page on which they appear.

EDW. DUFFIELD JONES.

Military Memoir of Colonel John Birch, sometime Governor of Hereford in the Civil War. Written by Roe, his Secretary; with Commentary, &c., by the late Rev. John Webb, M.A. Edited by his Son, the Rev. T. W. Webb, M.A. (Printed for the Camden Society. 1873.)

THIS new issue of the Camden Society has evidently been the subject of long and careful preparation on the part of its editors, and is in every respect worthy of the series. The original memoir, which supplies a title, forms but a small portion of the entire volume, and serves chiefly as a peg whereon to hang various commentaries and notes, which to our mind form the most attractive feature. Many of the latter are based upon original documents as little known as Secretary Roe's rather heavy narrative, and bring out numerous minor incidents of the Civil War which have escaped the notice of previous historians.

The origin of the hero of this story is involved in obscurity; Burnet would have us believe that his occupation, when he took up arms, was that of a pack-horse driver, and that his manners and address were sufficient proof of no higher breeding. Some original papers, now printed for the first time, entirely confute the learned bishop; and it is sufficiently shown that when the Civil War broke out, Birch was carrying on commercial enterprises with his brother at Bristol. As a captain of volun-

teers there, between March and July 1643, when the city was compelled to surrender, he rendered great service to the Parliament, and some important duties were then entrusted to him. His old trade being completely destroyed by the pillage of Bristol, he literally embarked in the "trade of war," and first found congenial employment in enlisting the butchers of Newgate Market, and in buying horses in Smithfield. The rage for fighting among the Londoners, it seems, was very strong; the city was a vast hive of armed men, not less than 10,000 volunteers being enrolled in the levy of 1642. A few years later the city had at its command an assembly of eighteen regiments of foot, some of them 1,800 and 2,000 strong, "all compounded of as gallant men, and as well provided for as any in the Christian world." Tothill Fields, Moorfields, and the New Artillery Ground, served as mustering places. We do not propose to track Birch through the many exciting episodes of the career which began with the merchant volunteer captaincy and culminated with a colonelcy, the governorship of Hereford, and a seat in Parliament; we prefer to notice, as illustrating the careful editing of the work, one or two other novel matters of historical interest.

Some remarkable facts are brought out in this volume about the employment of letter-carriers and spies on both sides, especially the great dangers faced by women in these services.

"Alone, over long and weary tracts, by perils of woods, bye-roads, and waters, they undertook arduous journeys, and many a despatch, now valuable as relating to an historical fact, or correcting an historical error, has been thus stealthily conveyed in the hair of the head, the hollow staff, the shoe, or next the skin, and preserved to posterity."

Such an adventurous female was "Scotch Nan," who regularly travelled between King Charles and the Marquis of Montrose. A spy, from York, reported that on the 31st of May, 1644, order was given to all the sentinels near that city to suffer no women or others to come out of it, but to examine them and send them in again; but one woman, who came to sell provisions in the city, being well horsed, rode full gallop past the guards, who shot at but missed her. During the siege of Latham House communication was kept up by means of a woman, who for several months risked her life in carrying despatches during the frequent sorties made by the besieged. She was at length taken and put to the torture, but she would reveal nothing, and suffered three fingers on each hand to be burnt off before her tormentors, desisted, tired out by her invincible fortitude. A dog was then trained to carry the despatches in his collar, and rendered great service for many months, till he was shot by a soldier, in mere wantonness, just as he had swam across the moat.

Equally novel and interesting are the glimpses we get of the eminent physicians of that time. Many of the leaders, we read, in both branches of the profession improved their skill and experience in this time of trouble. Thomas Sydenham, who left Magdalen Hall when Oxford became a garrison

for the king, discourses in his works on the copious blood-letting adopted in fever, the fruit of his observations at Dunstar Castle; while Wiseman, engaged on the Royalist side, treats of the cuts about the head and shoulders received by the infantry in charges of cavalry. The humane nature of their employment saved few of them from persecution and from confiscation. Of William Harvey himself we are told that "the artillery in the first great battle had nearly shed the blood of the celebrated discoverer of its circulation." Harvey, now about in his sixty-fifth year, attended Charles to Edgehill in his capacity of court physician. Remote, as he thought, from the effects of the strife, he reclined upon the turf while two of the young princes placed under his care played about him; his fancied security was, however, speedily disturbed by the plunging of cannon balls in the turf, and he made a timely retreat from danger. Dr. Bate, who wrote a history of the civil wars in Latin, was also a prominent king's physician, but did not in after years refuse the benefit of his skill to the Protector; tradition, indeed, credits him with the administration of a potion which accelerated Cromwell's death. When the estate of Stephen Fossett, surgeon to the Duke of York, was under sequestration, he produced two certificates setting forth that he, during his residence at Oxford, constantly and carefully dressed all wounded prisoners from the garrison of Abingdon, without any satisfaction for his pains; and, with much care and willingness at his own charge dressed all such wounded soldiers of the Parliament as from time to time were brought in, and "relieved them with other such necessities as were needful for them in the times of their extremity."

Many of the Camden Society's publications, though of great importance as works of reference, cannot be described as of an entertaining nature. We are glad to add that the volume now under consideration, while inferior to none of the series in its contribution to historical knowledge, has the additional quality of being from end to end thoroughly readable. J. J. CARTWRIGHT.

The Pursuivant of Arms; or, Heraldry Founded upon Facts. A Popular Guide to the Science of Heraldry. By J. R. Planché, Esq., F.S.A., Somerset Herald. To which are added Essays on the Badges of the Houses of Lancaster and York. A New Edition, enlarged and revised by the Author, illustrated with Coloured Frontispiece, five full-page Plates, and about 200 Illustrations. (London: Chatto and Windus, 1874.)

A NEW edition of this most useful, and withal most readable, work on Heraldry, will be gladly welcomed by all true lovers of the science, and especially by those who are devoted to the study of Heraldic Antiquities. The archaeology of Heraldry is undoubtedly far behind the general advance of antiquarian knowledge; and the art of heraldic drawing is still more in arrear of the general advance of art knowledge. In fact, since the general decadence of all art in the sixteenth century, Heraldry, as an Art, has never been more debased than at the

present time. Compare, for instance, the Garter Plates, placed of late years in St. George's Chapel, Windsor, with the Plates of the Knights of the Garter of the time of King Henry VI., and some others of a later date. The modern Plates are, as works of art, beneath contempt; whereas the earlier ones are not only amongst the most interesting and valuable of our national heraldic records, but are exceedingly beautiful. Mr. Planché has given, as the Frontispiece to his book, the Garter Plate of John Beaufort, Earl of Somerset, afterwards Duke of Somerset and Earl of Kendal, elected 20th of Henry VI. It is the earliest Garter Plate with supporters, and has been selected as affording a fine example of a complete achievement in the first half of the fifteenth century. The achievement is coloured; and, although the drawing is not very good, it will give a tolerable idea of the difference between heraldic compositions of the fifteenth century and those of our own time. A convincing proof of the present degradation of heraldic art was afforded by the display of flags, banners, and shields in the International Exhibition of 1871. That such a collection of vulgar, tawdry rubbish—which would have disgraced a toy-shop—should have been ostentatiously displayed in a building ostensibly erected for the purpose of guiding public taste in the right direction, was a disgrace to all concerned in the miserable outrage on good taste. As a favourable contrast, we may mention the heraldic decorations at the Leeds Fine Art Exhibition in 1868, executed under the direction of Mr. Henry Charles Brandling, which were nearly all that could be desired. Heraldry has been contemptuously described by those who ignorantly despise it as “the science of fools with long memories.” We may retort that Heraldry is an art-science scorned by fools with short memories—that is, by those who have basely forgotten the “noble, prowessfull, and puissant deeds” of their forefathers, and therefore lost all respect for an art which helps to perpetuate the remembrance of them. Judge Blackstone has remarked, in his *Commentaries*, that the marshalling of Coat-Armour “was formerly the pride and study of all the best families in the kingdom.” That a stupid neglect of the study of Heraldry is more general now than even in the last century, may be inferred from the passage in *Rob Roy*, where Sir Walter Scott makes the charming Die Vernon exclaim with indignant surprise, when Frank Osbaldistone confessed that he did not even know his own coat-armour:

“‘You an Osbaldistone, and confess so much! Why, Percie, Thorne, John, Dickon, Wilfred himself, might be your instructor. Even ignorance itself is a plummet over you.’”

“‘With shame I confess it, my dear Miss Vernon, the mysteries couched under the grim hieroglyphics of heraldry are to me as unintelligible as those of the pyramids of Egypt.’”

“‘What! is it possible? Why, even my uncle reads *Guillim* sometimes of a winter night. Not know the figures of heraldry! Of what could your father be thinking?’”

It is pleasant to picture the lovely and mettlesome little Jacobite and Papist in her “den,” as she called the library at Osbaldistone Hall, sitting at the huge oak table

on a high, straight-backed chair, with old *Guillim's* ponderous folio before her; or half sitting, half lying on the window-seat of a sunny bay window, with the *Disply of Heraldrie* on her knees, and the sunbeams stealing through the painted shields of arms in the old thick-mullioned window above, and lighting her with rainbow tints.

Of all old writers on heraldry, none are so delightful as *Guillim*. Many a young gentlewoman of the present day would find his quaint conceits and pious reflections more agreeable, and withal more profitable, reading, than the trashy novels or the “goody goody” books over which they so often fall asleep on Sunday afternoons. Mr. Planché has, in his *Pursuivant of Arms*, most completely refuted a popular error respecting what are commonly called *Canting* or *Allusive Arms*:

“Nothing,” he remarks, “but the utter ignorance of late writers of the first principles of the science they professed to illustrate, could have given rise to the invidious term. It is scarcely possible to find an ancient coat that was not originally canting or allusive (that is to say, alluding to the name, estate, or profession of the bearer), excepting, of course, those displaying simply the honourable ordinaries, which, as I have already stated, took their rise from the ornamental strengthenings of the shield, and even these were occasionally so. As I shall have numberless opportunities of proving this fact, I will only quote at present the words of the learned and reverend Father Marc Gilbert de Varrenes, who, in the section of his work devoted to ‘Armes Parlantes,’ observes, ‘If according to the maxims and practice of all sages, which ordain that we should, in the first place, ascertain the means by which we are most likely to arrive at our end, we take into consideration the mark at which aims the entire usage of shields of arms, I hold myself assured that in a few hours we shall change our minds, and instead of the contempt usually bestowed upon Canting arms, we shall acknowledge they deserve to be greatly esteemed for their simplicity. For as all armories were invented only to make distinctions between persons, and enabling us to discern one from another, serve as a particular mark of everything belonging to us, certainly nothing can be more conducive to this effect than to cause ourselves to be known by the animal or the article which has the same name that we have.’—*Le Roy d'Armes*. Paris: 1540.” And at page 469, he says: “This opinion derives its probability from the fact that our ancestors, less curious and more simple than we are at present, usually took care in the composition of their arms that there should be a correspondence between their names and the figures with which they emblazoned their shields; which they did, namely to this end, that all sorts of persons, intelligent or ignorant, citizens or countrymen, should recognise easily and without further inquiry, to whom the lands or the houses belonged, wherever they found them, as soon as they cast their eyes upon the escutcheons.”

The examples of “Armes Parlantes” which could be given are innumerable, and prove beyond a doubt that the most fruitful source of the almost infinite variety of family arms in all the nations of Europe is the relation or allusion of certain figures to the names of the bearers. Thus—

Three BOARS' heads are borne by SWYNEBURNE.

A HART's head by HERTLY.

A GOAT by William de CAPRAVILLE (*Caper*, *Capra*, Latin).

A BEAR by FITZ-URS.

A WOLF by Hugh LUPUS, Earl of Chester.

LAMBS by LAMETON and LAMBERT.

CALVES by CALVELEY, by METCALFE, and by VELB.

GREYHOUNDS by MAULEVERER (*Levrier*, French).

WOODMEN (Wildmen or Savages) by WOODD.

OTTERS by LUTTREL (*Loutre*, French).

EAGLES by ERNE.

SWALLOWS by ARUNDELL (*Hirondelle* French, *Aronde* or

Arondelle in old French).

A RAVEN by CORBETT (*Corbeau*, French), also by RAVEN, RAVENHILL, and RAVENTHORPE.

FALCONS by FALCONER.

HERONS by HERON.

COCKS by COCKAYNE.

The LUCE or PIKE by LUCY.

SMEETS by SMELT.

FLIES by MUSCHAMP (*Musca*, Latin).

BEES by BEESTON.

LEAVES by LEVISON and by FOULIS (*Feuilles*).

SNAILS by SHELLEY.

BRANCHES of NETTLE by AILLY (*Alier* or *Alisier*, French).

MALLETS by MAILLY.

TENCHES by TANQUES.

A wild CHERRY TREE by CREQUY (*Crequier*).

The four last named were noble families in Picardy who bore “Armes Parlantes;” whence the proverb—

“*Ailly, Mailly, Tanques, Crequy,
Tel Nom, telles Armes, tel Cry.*”

In early Armory the charges were invariably simple; and figures, whether of animate or inanimate objects, when introduced, were usually disposed in a manner to suit the triangular-shaped shield of the thirteenth century; two and one, or three, two, and one, being the most general arrangement when the charges were of any size. Lions or Leopards, Boars, Stags, Bulls, Calves, Bears, Wolves, Dogs, Eagles, Herons, Ravens, Falcons, Pelicans, and Martlets are the beasts and birds most frequently to be met with in ancient shields of arms; and, until the decline of Heraldry in the sixteenth century, the list could not be much extended. Simplicity and fitness being the characteristics of early shields, and complexity and absurdity those of modern ones, it requires but little knowledge of Heraldry to determine with tolerable exactness the approximate date of the assumption or grant of any shield of arms, and to distinguish between an ancient coat and one of the ridiculous and contemptible inventions of the professional Herald of modern times.

To the subject of Badges Mr. Planché devotes sixty pages of his book. One chapter is on Badges in general, and two chapters treat of the Badges of the Houses of York and Lancaster. Mr. Planché has in this part of his work given us a most interesting and valuable contribution to the somewhat scanty amount of information which we at present possess on this branch of heraldic knowledge. He introduces the subject thus:

“Little as is the authentic information we possess respecting Heraldry in general, our knowledge of that very interesting and curious portion of it—the Badges of our royal and noble families—is still more limited. Whilst scores of volumes have been written respecting the armorial shields of the sovereigns, barons, and knights of England, no author has treated critically the subject of Badges; and but one, Mr. Williment, in his *Regal Heraldry*, presented us with an indiscriminate collection of those said to have been assumed, at various periods, by the members of the blood-royal only. ‘Crests, Badges, Devices, and Mottoes form’ says an intelligent recent writer, ‘an interesting, though neglected branch of heraldic enquiry. The three last-named are often taken to mean the same thing; at least, badges are often confounded

with devices, and devices with mottoes, owing to the confused notions entertained upon the subject by writers on heraldry, who have not sufficiently attended to the distinction made between them in the time when their use generally prevailed."

It is to be wished that the plates, containing drawings of the Yorkist and Lancastrian Badges from ancient examples, and which serve to illustrate this portion of the work, had been more worthy of the subject and Mr. Planché's able treatment of it. They are poor in drawing, and wanting in spirit and true heraldic feeling. As drawings, they are inferior to the wood-cuts in the volume, many of which are also very tame and spiritless; in some cases not even possessing the merit of accurately portraying the objects which they profess to represent; as, for instance, the figure of Simon de Montfort on horseback, from a window in the Cathedral of Chartres. Lest we should be guilty of making too sweeping a condemnation of all modern heraldic art, we must make some honourable exceptions; for, as in Architecture, so in the art of Heraldry, there are a few earnest men, humbly striving to understand and imitate the noble works of art of the Middle Ages, which have escaped the ravages of time, and the still worse ravages of the godless barbarians of the sixteenth century, who did their best, or worst, to destroy all that was ennobling and beautiful, both in Religion and Art. During late years, many heraldic stained glass windows of more or less merit have been designed by Williment, Heaton, Powell, Bentley, and others; and we are glad to notice a growing taste for this most effective and appropriate mode of decorating a building. Every architect ought to study Heraldry and recognise the value of Heraldic Art as a most useful ally to his own; for, as a recent writer has remarked, "Heraldry alone can enable him to render his works in the noblest and most perfect sense historic monuments."

Heraldry—to quote the words of Mr. Boutell—since

"the palmy days of Edward III. has had to encounter, in a degree without precedent or parallel, that most painful and mischievous of trials—the excessive admiration of injudicious friends. Hence heraldry was brought into disrepute, and even into contempt, by the very persons who loved it with a genuine but a most unwise love. In process of time no nonsense appeared too extravagant, and no fable too wild, to be engrafted upon the grave dignity of the herald's early science. Better times at length have succeeded. Heraldry now has friends and admirers, zealous as of old, whose zeal is guided aright by sound judgment. Very much already has been accomplished to sweep away the amazing mass of absurdities and errors which had overwhelmed our English heraldry, by such men as Courthorpe, Nichols, Seton, Planché, Walford, Montagu, and Lower."

To this list of names we would add Boutell; for no writer on Heraldry has done more good service towards making the science of Armory attractive and popular than Mr. Boutell himself. JOHN HENRY METCALFE.

MINOR LITERATURE.

Threading my Way: Twenty-seven Years of Autobiography. By Robert Dale Owen. (Trübner.) It is a disadvantage to the author of an autobiography when the most interesting information

he has to communicate relates to events in which his own share was secondary or subordinate, while the events themselves have been so much discussed that there is little new to be said of them. Mr. Owen labours under the further disadvantage of having written in chapters for publication in a magazine (the *Atlantic Monthly*), a work of the kind that more than any other requires unity of treatment, and the absence of any constraining sense of an obligation to be amusing; while the family details, which the son of an eminent man can scarcely wish to omit, are in this case forestalled, the father having written his own life up to a later date than that reached in the present work. Subject to these drawbacks, *Threading my Way* is an interesting work, the more so that the author has had the forbearance to keep his pronounced views on such subjects as spiritualism in the background. Reminiscences of childhood are, as a rule, only interesting if the hero of the autobiography is either imaginative enough to turn them into a romance, or illustrious enough to give the least detail about him the importance of history; but the passages in which the writer narrates an unsuccessful attempt made, when he was about eleven, to convert his father to Christianity, is so true to human nature that it deserves to live. It is perhaps also natural that a child brought up in the neighbourhood of New Lanark should have few recollections of its peculiarities, as children only notice what is new to them. The description of the college at Hofwyl, to which Robert Owen sent his two eldest sons, as the most rational place of education in Europe, is more interesting; and the remarkable gifts of Fellenberg, the conductor of the experiment in education described, make it possible, though not easy, to credit the marvellous account which his old pupil gives of its success. Self-government was the ruling idea of the scheme; and, according to Mr. Owen, the confidence reposed in the pupils, with the best result, went far beyond anything even proposed by Dr. Arnold; the professors, in fact, had nothing to do but teach; the students made their own rules, and if necessary enforced them on each other, by officials elected from their own number solely on the ground of merit and fitness for the office,—as Mr. Owen somewhat pointedly assures his adopted countrymen. A strange little love passage, of which the heroine, Jessie, was a beautiful child, from the New Lanark Mills, has a good deal of realistic pathos about it, the rather that it comes to nothing, as romances in real life so often do. Mr. Owen has not much that is new to tell us of the experiment at New Harmony, or of the special causes of its failure, but observes that the weak point in all his father's schemes of reform was a disregard of the one important element of time. The author of the *Essays on the Formation of Character* had not patience to wait till his schemes could be executed with instruments formed on purpose. He also discusses at some length the modern bearing of the consideration to which Robert Owen was one of the first to direct attention: the immense increase of the productive power in the world by the application of steam to machinery, and the conditions which have, paradoxically, made this increase anything but a source of relief to the labourer. He promises a future volume, in which his own (and perhaps his father's) conversion to "spiritualism" will be described, and in preparation for this gives us the chart of his head traced by Spurzheim and another phrenologist, in which the organ of "marvellousness" is described as small. Judging from this installment of autobiography, we should not feel inclined to reject this estimate of the author of *The Debatable Land and Footfalls on the Boundary of Another World*. There are many professed "spiritualists" whose credulity appears to be far more the result of a slow than an excitable imagination; they fail to realise the significance of the issues they raise, and therefore accept without demur such evidence as is allowed to pass muster in common life, just because nothing depends upon its truth.

Half-hours with the Early Explorers. By Thomas Frost. (Cassell, Petter, & Galpin.) This work consists of short accounts of the voyages and travels of the principal explorers who flourished between the middle of the thirteenth century and the close of the sixteenth. Commencing with Marco Polo and Sir John Mandeville, the author briefly describes, in a series of chapters, the wanderings and discoveries of Columbus, Vasco da Gama, Amerigo di Vespucci, Frobisher, Drake, Raleigh, Barentz, and the other travellers and navigators, French, Italian, Dutch, and English, who, during the two centuries and a half which made the nations of Europe the rulers of a great portion of the world, penetrated into many unknown seas and regions of the earth. Each chapter deals with the adventures of one or more of these famous pioneers of commerce, so that the book as a whole gives a fairly readable and interesting account of discoveries in America, Africa, Asia, the Arctic regions, and the Pacific, which were due to the same spirit of enquiry and the same outburst of mental energy which gave birth to the Reformation and the dawn of modern science. Such a work can scarcely fail to be interesting. Of the numerous woodcuts which illustrate the pages many are valuable, especially those reprinted from the old *Livre des Merveilles*, representing the strange animals which were said to be seen by that worthy predecessor of Le Vaillant and Du Chaillu, Sir John Mandeville; but we do not always see the connection between the illustrations and the letterpress, nor clearly understand why portraits of Henry VII., Elizabeth, and James I. should be inserted in the descriptions of voyages made by their officers. However, one can scarcely complain, considering the small price of the work, that it bears marks of book-making. We have no doubt that it will furnish a large and useful stock of information to the juvenile public, for which it is chiefly intended. EDITOR.

NOTES AND NEWS.

MR. W. R. MORFILL, of Oriel, has sent to press his edition of the Ballad Society's second volume of *Ballads from Manuscripts*. The volume will contain ballads on Queen Elizabeth and the Duke of Buckingham, &c.

A-PROPOS of the election to the French Academy, M. Thiers voted for Charles Blanc; and Mgr. Dupanloup has announced that, had he been able to reconcile it to his conscience to accept a seat under the same roof with M. Littré, he would have voted for the author of *Le Fils Naturel*. That brief announcement forms the most scathing satire that could be penned on the prelate's moral sense and Christian charity. Dumas' election was perhaps more a reparation than a reward.

It is to be feared that there will shortly be a vacant fauteuil in the second category. Jules Janin's condition has altered very little, but that little has been for the worse, and age and weakness begin to lessen every hour the famous critic's chances of life. They have also unfortunately lessened his confidence in himself. He has been completing and polishing for the last two years a work that has no parallel in France: *l'Histoire de la Critique en France*—a subject in which the critic had even more room for the play of his erratic and digressive fancy than was afforded by the generous columns of the *Débats*. But it appears we must abandon all hopes of the work, at least in a complete form. Intellectual hypochondriasis—the malady of Dickens, De Musset, Walter Scott—has seized the critic; the book is burnt, and a few detached essays will alone be given to the public. These morsels are carefully screened from the eye of *littérateurs* and gossip-mongers. Janin has on several occasions had his work deflowered by premature disclosures concerning plot and purpose.

THE *Nation* gives a history of the sword which Byron wore at Missolonghi. Byron, it appears,

gave it to a native Greek officer, who fell, with the sword knotted to his wrist, in the same action in which Marco Bozzaris lost his life; the heirs of this officer sold it to Colonel Miller, who used the sword to some purpose in the last and greatest siege of Missolonghi, and finally took it with him to America, together with two sons of a Madame Miltiades, who claimed to be lineally descended from the hero of Marathon. It has now passed into the hands of a descendant of Colonel Miller, resident at Chicago, who only saved herself, a small box of plate, a shawl which she threw over her head, and, last but not least, Byron's sword, in the great fire of 1872.

MR. SKRAT seems to have identified the Latin hymn which Chaucer makes the widow's son sing in the Prioress's Tale, and for singing which the Jews cut the boy's throat. This hymn Chaucer describes as *Alma Redemptoris*, in the Antiphonarium that children learnt. He also says it

"Was maked of our blisful lady fre,
Hire to saluen, and eek hire to preye
To ben our help and socour whan we deye."

Probably most hymns to the Virgin do this more or less; but the one which Mr. Skeat finds in Mone's *Hymni Latini* meets all the three points of Chaucer's hymn. It starts with "*Alma Redemptoris mater*," has the salutation "*Omnes tibi dicunt Ave!*" and the prayer for help from hell after death:—

"Audi, mater pietatis,
Nos gementes pro peccatis;
Et a malis nos tuere,
Ne dampnemur cum impiis
In aeternis suppliciis
Peccatorum misere."

MR. F. W. COSENS has in the press his translation of the Spanish version of *Romeo and Juliet*, by Rajas.

THE Early English Text Society's first issue of books for this year is now in the publisher's hands for distribution to members. It consists of Part II. of the *Gest Hystoriale of the Destruction of Troy*, edited from the unique MS. at Glasgow by Mr. David Donaldson and the late Rev. E. A. Panton; Part I. of the *Early English Version of the Cursor Mundi*, from parallel texts from fourteenth-century MSS. of three different dialects, in the libraries of the British Museum, Bodleian, Göttingen University, and Trinity College, Cambridge, edited by the Rev. Dr. Richard Morris; Part I. of the *Bückling Homilies*, 971 A.D., from the Marquis of Lothian's unique MS., edited by the Rev. Dr. R. Morris: these for the Original Series;—and for the Extra Series, Part I. of *Herry Lonelich's History of the Holy Grail*, translated (about 1450) from the Old French of Sires Robiers de Borron, re-edited from the unique MS. at Corpus, Cambridge, by Mr. F. J. Furnivall.

MISS F. E. BUNNETT is about to revise her translation of Gervinus's "profound and generous" *Commentaries on Shakspeare*, for a new and cheaper edition of the book. Only a few copies of the original two-volume edition in large octavo are left.

WE hear that there is a good chance of Mr. Richard Simpson's editing a collected edition of the works of Thomas Nash (of St. John's College, Cambridge), Shakspeare's contemporary, for Mr. Pearson. We hope Mr. Pearson will relieve the New Shakspeare Society of Lodge's and Chettle's works, as well as Nash's.

A FRENCH writer who has great claims upon the gratitude of several parties has lately had the highest reward that awaits the broad-principled and malleable journalist. M. Ernest Daudet, the novelist, is appointed editor of the *Journal Officiel*.

M. CATULLE MENDES, the son-in-law of Théophile Gautier, has just become the spokesman of Victor Hugo, George Sand, Alphonse Karr, Théodore Barrière, and Paul Féval, in a question of some

literary importance. The letter inspired by the eminent writers just named is addressed to the Austrian journalist Henri Laube on the subject of a projected International Society of Men of Letters. M. Laube has convoked, at Vienna, a Congress of Austrian Writers, which shall mediate on literary questions between France and the German Empire. From this basis the International Society is to rise. The German adherents are—Hacklaender, Paul Heyse, Gottschall, Hettner, Geibel, and Levin Schücking.

M. JULES SIMON's new work, *Réforme de l'enseignement secondaire*, treats not only of the reforms which the author had commenced to introduce during his tenure of office, but also of all questions affecting the future of education in France, such as hygiene, gymnastics, living languages, position of masters, &c.

A GREAT deal has been written on the subject of Shakspeare's autographs, and the early editions of his plays. This month's *Polybiblion*, in a notice of the Bibliophile Jacob's tract, *La véritable édition originale des œuvres de Molière*, gives some interesting details with regard to the early editions of the great French dramatist. The first edition of Molière's works, formed by Molière himself, was published in 1673 by Denys Thierry, and only a single copy is known to exist, which is the property of an amateur at Bordeaux. The edition of 1674 was also published by Thierry, in six volumes (to which was added in 1675 a seventh, containing the *Malade Imaginaire*, and a spurious piece, *L'Ombre de Molière*), and had probably been composed and perhaps corrected at Molière's sudden death in 1673. Four copies of this edition are known to exist, and one was sold in 1860 for 910 francs. The edition of 1682, published by Molière's friends Lagrange and Vinot, after long neglect, acquired great literary importance on the discovery of a copy containing all the passages suppressed by the censor. This copy had belonged to M. de la Reynie, lieutenant-general of police; it was taken to Constantinople, but afterwards found its way into M. de Solenne's dramatic library; at his sale in 1844 it was sold for 800 francs, and when next brought to the hammer fetched 1210 francs. Another unexpurgated copy was sold in 1867 for 2,500 francs. M. Lacroix in his tract above mentioned prefers the edition of 1674-5 to all others.

THE same editor, in his *Bibliographie moliéresque*, of which a new edition is in the press, mentions eight tracts relating to discoveries of autographs of Molière. M. Fillon gives twenty-one signatures of Molière—the dramatist, like Shakspeare, used several signatures—"De Molière," "J. B. Poquelin Molière," and "J. B. Poquelin." A receipt, signed "Molière," written throughout by Molière's own hand, has recently been discovered among the papers from the Treasuries of the Etats provinciaux de Languedoc, and a facsimile issued by M. de la Pijardière, who is about to publish additions to the life of the dramatist, with a number of documents relating to his stay in Languedoc.

WE learn from the *Allgemeine Zeitung* that the late Dr. Ruland, who was head librarian at the University of Würzburg, has by his will bequeathed his books to the Vatican Library, and his valuable collection of Frankish coins to the Museum at Würzburg.

THE privileges enjoyed by readers in public libraries suffer abuse in other places besides the British Museum. In the last Report of the Trustees of the Public Library, Museums, and National Gallery of Victoria, we read that the Library Committee is "forced reluctantly to the conclusion that some few persons, grossly and in a most dishonourable manner, abuse the freedom of admission to the library, and the unrestricted use of the books. In some instances passages, pages, and whole sheets have been abstracted from books, and chiefly those of sacred literature; entire sermons have been excised from five volumes. These most disgraceful practices have called for more

than usual vigilance of late, and, though distasteful to all concerned, a more frequent perambulation of the room than formerly by the attendants has been ordered. By these means, and by a close observance of the habits of some individuals, a stop has been put to such aggressions on the property of the public."

The number of volumes in the above-named library, in 1873, did not exceed 65,000, with upwards of 10,000 pamphlets; and the sum of 1,400*l.* was voted in the last financial year to be remitted to London for the purchase of books. The number of readers for the year 1872-3 was 237,073. These visitors, we are told, "are now admitted to a suite of apartments 230 feet long, 40 feet wide, and 40 feet high, decorated in a purely classical homogeneous style, free from obtrusive colour or undue ornament, at once a suitable place of deposit for the varied and extensive collection of valuable books, and a convenient place of resort for the occasional reader or accustomed student."

WE notice the following features in the new Dutch University Bill. It is not the intention of the Government to suppress any of the existing Universities, Leyden, Utrecht, and Groningen. The preparatory course at the Gymnasias is to be lengthened by two years, and to be made a "chiefly classical" one. The final gymnasial examination will no longer give a title to admission to the lectures in the Universities. The faculty of philosophy is [described (art. 20) as comprising (a) philosophy and its history, (b) language and literature, (c) history, geography, and ethnology, together with the history of art and letters; but no mention is made of chairs for Sanskrit or any of the modern languages. No qualifications of any kind will be required in the academical teachers; they are to be nominated by the Senate. All University degrees will cease to authorise the holders of such honours to teach in the secondary schools. The Professors' fees will be abolished and replaced by liberal salaries from the Government. For the Faculty of Theology will be substituted a course on "The Science of Religion," which course is circumscribed as follows:—(a) "The History of Religious and of Theological Systems;" (b) "The History of Religious Dogmas;" (c) "The Exegesis and History of the Legends of Religion;" (d) "The Philosophy of Religion." No professor, finally, will be permitted to hold his appointment after his seventieth year.

A DUTCH Penny Magazine announces the forthcoming appearance in its columns of a new novel by Miss Braddon, entitled *Sylvia*.

IN the robbery of the poet Chaucer, on September 3, 1390, which we mentioned the week before last, Richard II.'s writ to his Barons of the Exchequer (which we also referred to) shows that Chaucer lost, not only 20*l.* of the king's money, but also his horse and other moveables. Further, on searching for the conviction of the robbers, Mr. Selby, of the Public Record Office, finds notices of two robberies of Chaucer—one of 10*l.* of numbered money between Kingston and Combe Wood, the other of 9*l.* and 40*s.* at Hatcham, in Surrey—on days very near September 3, 1390; so that they look like different robberies, though the sums of which the poet was then robbed come so nearly to 20*l.* that the difference is not certain. The robber first accused of feloniously despoiling our poet was Richard Brearley. He turned approver, and accused William Huntingfield of being the culprit; on which Huntingfield appealed to the wager of battle, and, having beaten Brearley, Brearley was hanged. But Huntingfield did not get off free, as, being guilty of other felonies, he was committed to the custody of the marshal. It is pretty certain that Chaucer, as he rode about with the king's money in his purse to pay wages, &c., must have often done it at the risk of his life.

With regard to what seemed Chaucer's neglect as clerk of the works at St. George's Chapel,

Windsor, the accounts of the executors of his successor, John Gedney, have been examined by Miss Smith for Mr. Furnivall; and they show that Gedney not only did no repairs to the chapel, but carted away to Shene, &c., the stone that Chaucer had bought. The chapel was, no doubt, allowed to tumble down or fall into entire decay, and was then rebuilt in the fifteenth century by Edward IV. Chaucer is thus cleared from blame. He has also the credit of having spent, in buying this stone, above 20*l.* more out of his own pocket than the Exchequer advanced him for the general purposes of his office.

THE same page of the *Saturday Review* (p. 172) that contained the "elaborate blunder" about Chaucer, which was commented on in our columns last week, contains almost as funny a statement about Shakspeare. "Cut out from Shakspeare the character of Hamlet, and all the subsidiary characters into which the *Hamlet* element enters as a main constituent, and, though Shakspeare would still be a very great poet, he would have made a long descent towards the level on which Jonson and Fletcher and a number of scarcely inferior rivals may be placed." So Falstaff, Henry V., Shylock, Lear, Lady Macbeth, Benedick, Beatrice, Imogen, Miranda, Puck, Caliban, &c., are very near the level of the characters of Fletcher and his "scarcely inferior rivals"! Shakspeare, the creator of comedy, of fairyland, of the beauty of woman's character, the lifter of tragedy and historic play to their true height, is but near Fletcher, &c., if the Hamlet side of his mind is cut away! But the *Saturday* condescends to comfort us. Shakspeare "would still be a very great poet." This is soothing.

THE Rev. F. G. Fleay has compiled for the New Shakspeare Society a table of the editions published in Quarto of Shakspeare's plays. This table shows the date, printer, and publisher of each edition; the original, if any, from which it was taken; the plays of which editions were published in any given year, and the succession of the publishers to their predecessors' copyrights. It also distinguishes genuine from spurious editions; traces the Quartos, as far as possible, into the hands of the proprietors of the First Folio; marks the editions which had not Shakspeare's name on the title-page, and those from which the Folio editors printed the plays for which they did not use independent sources. To the table are subjoined explanatory notes, and a list of the addresses of printers and publishers. From these data Mr. Fleay deduces a list of editions which it is desirable for the Society to reprint. This list we subjoin.

Parallel Texts.—Class I. Imperfect texts to be printed parallel with subsequent perfect ones, so as to show the manner of Shakspeare's work if the imperfect plays be really sketches, or to disprove his share in them if they be spurious:—

Romeo and Juliet: 1st Quarto, 1597, with 2nd Quarto, 1599.

Hamlet: 1st Quarto, 1602, with 2nd Quarto, 1604.

Merry Wives of Windsor: 1st Quarto, 1601, with Folio.

Henry V.: 1st Quarto, 1600, with Folio.
Contention of York, &c.: 1st Quarto, 1594, } with Folio of
True Tragedy, &c.: 1st Quarto, 1595, } *Henry VI.*

Class II. Plays where the texts of Folio and Quartos differ greatly, and are derived from independent sources:—

2 *Henry IV.*: Quarto, 1600, with Folio.

Hamlet: 2nd Quarto, 1604, with Folio.

Othello: 1st Quarto, 1622, with Folio.

Troilus and Cressida: Quarto, 1609, with Folio.

Lear: 1st Quarto, 1608, with Folio.

Richard III.: 1st Quarto, 1597, with Folio.

Class III. Texts where two Quartos from independent sources are worthy of comparison in detail for critical reasons:—

Midsummer Night's Dream: 2nd Quarto, 1600.

Merchant of Venice: 2nd Quarto, 1600.

Othello: Quartos of 1622 and 1630.

Class IV. The other quarto editions, viz.:—

Titus Andronicus: 1600, 1st Quarto.

Richard II.: 1597, 1st Quarto.

Love's Labour's Lost: 1598, 1st Quarto.

1 *Henry IV.*: 1598, 1st Quarto.

Much Ado About Nothing: 1600, 1st Quarto.

Pericles: 1608, 1st Quarto.

Two Noble Kinsmen: 1634, 1st Quarto.

—would require only single texts to be printed.

In all instances Mr. Fleay thinks that collations of the other editions should be given. In two plays only would three texts be necessary, viz. in the cases of *Hamlet* and *Othello*. But Mr. Fleay is of opinion that it is very desirable to print, not only fac similes, but also revised texts of the imperfect plays of *Hamlet* and *Romeo and Juliet*, parallel with revised texts of the perfect copies. He will shortly publish his reasons for this opinion. By Folio throughout this notice is meant the First Folio of 1623.

As there has been a good deal of controversy lately about who was the original of Mr. Robert Browning's popular poem of "The Lost Leader," we may as well say positively, that while the character represented is that of no one man, but made up of many, as Mr. Forster tells us that Dickens's Skimpole and other characters were, yet the man who was mainly in Mr. Browning's mind when he wrote, and who in fact suggested the poem, was Wordsworth, on his change from Liberalism to ecclesiasticism and Toryism. If to any admirers of Wordsworth this fact now seems strange, they should turn to Shelley's tenderly reproachful sonnet to Wordsworth, and see how deeply he, too, felt his "leader's" defection from the cause of the liberty he loved:—

TO WORDSWORTH.

Poet of Nature, thou hast wept to know
 That things depart which never may return;
 Childhood and youth, friendship and love's first glow,
 Have fled like sweet dreams, leaving thee to mourn.
 These common woes I feel. One loss is mine,
 Which thou too feel'st; yet I alone deplore.
 Thou wert as a lone star, whose light did shine
 On some frail bark in winter's midnight roar:
 Thou hast, like to a rock-built refuge, stood
 Above the blind and battling multitude:
 In honoured poverty thy voice did weave
 Songs consecrate to truth and liberty,—
Deserting these, thou leavest me to grieve.
 Thus having been, that thou shouldst cease to be.

(P.S.—We see that Mr. Bouchier, in last week's *Notes and Queries*, quotes this sonnet in confirmation of the Wordsworth original of Mr. Browning's poem. It naturally rises to everyone's mind. Mr. Bouchier is only wrong in supposing that Wordsworth was the sole original of the "Lost Leader.")

At the Stratford Jubilee in 1764, a pair of Shakspeare's gloves were presented to Garrick. These gloves Garrick valued more than his other Shakspeare relics; and Mrs. Garrick by her will bequeathed them to Mrs. Siddons. She in her turn left them to her daughter, Mrs. Combe; and she again left them to Mrs. Kemble. Mrs. Kemble has lately presented these gloves to Mr. Horace Howard Furness, of Philadelphia, the able editor of the well-known new Variorum edition of Shakspeare, in which each play is to have a volume to itself, and of which *Romeo and Juliet* and *Macbeth* are out, while *Hamlet* is in active preparation.

THE latest additions to the Vice-Presidents of the New Shakspeare Society are Sir Edward Strachey (author of *Shakspeare's Hamlet*, 1848, &c.); the Public Orator at Cambridge, Mr. R. C. Jebb, Fellow and Tutor of Trinity; the editors of the *Edinburgh* and *Quarterly Reviews*, and the *Academy*; Professor H. Corson, of Cornell University, U.S.; the Rev. H. N. Hudson, of Boston, U.S. (author of *Shakspeare: his Life, Art, and Characters*). Mr. H. H. Furness, of Philadelphia, has sent a donation of ten guineas towards the expenses of founding the New Society.

THE *Nuova Antologia di Scienze, Lettere ed Arte*, for January, contains an interesting memoir of the life and writings of Cecco Angiolieri, of Siena, a humorous poet of the thirteenth century, some of whose sonnets have been lately discovered in the Barberini Library at Rome. He was the contemporary and also the correspondent of Dante, with whom, except as a poet, he can have had no feeling in common, for his life was one of intemperance and poverty, of which his writings bear the strong impression.

At the sale of rare books and MSS. at the Rooms of Messrs. Sotheby, Wilkinson, and Hodge, on Tuesday, the following lots produced the prices annexed:—An old black-letter Bible in English, by Miles Coverdale, printed at Zurich in 1560, although wormed and made up with fac similes, 5*l.* 10*s.*; a series of 127 Ballads printed between 1670 and 1690 for singing in the streets, and sold for one halfpenny each, 4*l.*; Cranmer's Version of the Bible, issued in November 1541, imperfect, 20*l.*; Capgrave's *Legenda Angliæ*, printed in 1516 by Wynkyn de Worde, but wormed, 23*l.*; Voragine's *Legenda aurea*, also printed in 1527 by Wynkyn de Worde, imperfect, but made up with fac similes, 41*l.*; Cristine de Pisa's *Boke of the Fayt of Arms*, printed by Caxton in 1489, with several leaves in fac simile, 103*l.*; an *Officium Beate Marice Virginis*, printed on vellum in 1499 at Lyons, 51*l.* 10*s.*; Higden's *Polyconicon*, printed in 1527 by Peter Treveris, and considered the *chef d'œuvre* of his press, 17*l.* 15*s.*

At the recent sale of the library of the Château d'Iléry, the following were among the most important works sold:—Le premier livre de la *Métamorphose d'Oride*, traduit du latin en françois par Clément Marot. Lyon: chez Gryphius, 1,150 fr.; *Les Œuvres de Clément Marot*; le tout par lui corrigé et mieux ordonné que cy-devant; imprimé à Paris par Anthoine Bonnement sur la copie de Gryphus de Lyon, 1,100 fr.; *Extraits ou recueil des îles nouvellement trouvées en la grand Mer Océane au temps du Roy Despaigne Fernand et Elisabeth sa femme*, fait premièrement en latin par Pierre Martyr de Millan; item trois narrations dont la première est de Cuba, la seconde qui est de la mer Océane, la tierce qui est de la prinse de Temistitan. Imprimé à Paris par Simon de Colines, 1532, 710 fr.

THE *Times* states that Sir William Muir has just given one of his 100*l.* rewards to a Delhi moulvee, Nazir Ahmed, for a third Oordoo novel of great ability and purity of style and thought—*Taubat-un-Nasuh* (the Repentance of Nasook). The hero is a deputy-magistrate, who is led to reformation of life by an attack of cholera, during which in a dream he sees, and is judged at, the Last Day. He recovers, and educates his children religiously. The book is a tale of domestic life, unmatched for beauty, toleration, and virtue in all Mussulman literature. Its moral is that religion is the root of domestic happiness.

THE *Banker's Almanac* for 1874 (New York) contains a reminder of the effects of the war in its table of "Premium on Gold at New York, in August 1868–1873." On August 6, 1868, the figure was 50; on August 6, 1873, 15½. The Almanac has thirty-three drawings of new coins issued during 1868–72, including nine Japanese ones of from one to twenty yen, a Mexican peso, and a Hungarian dollar.

THE valuable papers lately belonging to the Earl of Macclesfield, and purchased by the trustees of the British Museum in 1872, are now completely arranged and bound, and are open to consultation by the public. The importance of these documents was pointed out by the Historical Manuscripts Commissioners in their first Report. They consist chiefly of letters addressed to Ellis, secretary to the Duke of Ormond, and afterwards Under-Secretary of State. Those of George Stepney, between 1694 and 1707, are of a very interesting character, and relate to the negotiations in which he was employed during this bustling

period—to the movements of the allied armies, the Electors of Germany, and the subsidised German troops. During these years Stepney was employed as the king's commissary and deputy in Saxony, in negotiations at Düsseldorf and Frankfurt with the Elector Palatine and the Elector of Treves, and at Loo and the Hague in negotiations which resulted in the Treaty of Ryswick in 1697. In the year 1698 Stepney was appointed envoy to Berlin, whence he was recalled in August, 1699. From March 1701 to September 1706, he was minister at Vienna. Many of his despatches are preserved amongst the State papers, but these letters to Ellis fill up large gaps in that series. The correspondence of James Cressett with Ellis between 1693 and 1702 forms another part of the Macclesfield Collection. Cressett was employed by William III. during this period at the several German Courts, where he was the king's resident, more especially at Hanover, Zell, and Hamburg. In the last year of William's reign, he assisted with Stepney, Matthew Prior, Sir Joseph Williamson, Alexander Stanhope, the Earl of Marlborough, and others, in treating with the ministers of Denmark, in concert with Holland, and with several of the German Electors, in concert with other princes, for the general peace of Europe. Other noteworthy portions of this collection are letters from Matthew Prior, dated at the Hague and Paris, between July 1695 and July 1699; and a long series of communications, extending indeed over a period exceeding forty years, from Humphrey Prideaux, the well-known Dean of Norwich, who died in 1724.

FROM the *Proceedings of the New England Historic-Genealogical Society* at the annual meeting held January 7, 1874, we learn that the Society has recently become possessed of a valuable collection of manuscripts illustrating the American War of Independence. These papers, which are known as the Knox Manuscripts, number about fourteen thousand separate articles, and contain letters from Washington, Lincoln, Greene, Lafayette, Lincourt, and many other prominent revolutionary soldiers.

Among these documents are to be found the original articles for the capitulation of Yorktown, with the signatures of Cornwallis and Symonds attached. The library of the Society contains at the present time upwards of 11,000 bound volumes, and well-nigh 37,000 pamphlets. The Society endeavours as far as possible to procure every book, pamphlet and broadside illustrative of the history, general, local and personal, of the New England States.

WE learn from America that Messrs. J. B. Lippincott & Co. have in the press *Public Men and the Events from the Commencement of Mr. Monroe's Administration in 1817, to the Close of Mr. Fillmore's Administration in 1853*, by Nathan Sargent.

M. ARMAND BASCHET, author of *La Diplomatie vénitienne* and *Le Roi chez la Reine*, has just published a volume, *Le Duc de Saint-Simon, son Cabinet et ses Monuments*, giving the history of the papers of the Duc de Saint-Simon. On the Duke's death, March 2, 1755, his papers and MSS. were sealed, and an inventory commenced; but on the death of his cousin Claude de Saint-Simon, to whom he had bequeathed them, they were handed over by order of the king to the Foreign Office, December 21, 1760, and the Abbé de Voisenon received orders to make extracts from them. In 1819 the MS. of the *Mémoires* was given by Louis XVIII. to the Marquis de Saint-Simon, a very distant relation of the Duke, and published ten years later; but the rest of the papers—containing, probably, the Duke's correspondence with the Duc d'Orléans, historical fragments, the projects of government which he had submitted to the Duc de Bourgogne, and perhaps a supplement to the *Mémoires*—still remain in the archives of the Foreign Office.

THE American Jewish Publication Society of New York has just issued its first work, the fourth

volume of Dr. H. Graetz's *History of the Jews*, translated by the Rev. J. K. Gutheim, of New Orleans, La. The contents of the volume embrace the most interesting period in Jewish annals—the Talmudic, which is replete with suggestion to the Christian historian, from the light which it throws on the origin and development of Christianity. As Dr. Graetz well says, the disregard of this fact by Renan, Strauss, and Schenkel has avenged itself on those writers, and their brilliant delineations are often lacking the basis of historical truth merely from their ignorance of Hebrew literature of the early Christian centuries.

NOTES OF TRAVEL.

MR. E. COLBORNE BABER, Acting Vice-Consul at the port of Tamsuy (including Kelung), in his latest Report, just issued among the parliamentary papers, with other Consular Reports from China, supplies some curious notes on the effect produced by the growth of camphor in his district. The trees which produce this valuable article are not found within the district marked on maps of Formosa as Chinese territory. They occur only within the country of the aborigines, or upon the immediate border. The manufacture of camphor necessitates the destruction of the trees, which are never replanted; as the country becomes denuded the aborigines recede, and the Chinese effect a corresponding encroachment. The border country is thus in a continual state of disturbance, and fearful outrages are committed by both sides on every opportunity. A naval officer, lately returned from an expedition into the interior, informed Mr. Baber, that on entering the hut of one of the aborigines, he was shown six Chinese queues hanging behind the door (the possession of a queue indicating the previous capture of a head), and in another place he passed a party who were feasting in honour of a newly-taken head. On the few occasions when they have been visited by foreigners, the aborigines have shown a disposition to be friendly, but with the Chinese it is a veritable "war to the knife." It is worthy of remark, adds Mr. Baber, that the local Chinese use the same word "hwana," savage, to designate aborigines and foreigners alike.

FROM the same Reports may be gathered a variety of facts illustrating the remarkable decrease in the amount of opium imported into China, from the tendency of the natives to smoke the home-grown article, which they find less deleterious than the foreign; and another great advantage is that the habit of smoking it can be comparatively easily thrown off. The Rev. Doctor Edkins, in travelling overland from Tientsin to Shanghai, passed through a poppy-growing district, and thus writes to Mr. Malet: "An opium cultivator told me that a mow of land planted with poppies yielded him five ounces of silver a year, while ordinary crops of wheat, millet or kauliang would yield him one ounce or more. So great a profit must continue to spread the cultivation rapidly till price descends. The greediness of the consumer for his gratification, and a perpetual increase of the number of smokers, have hitherto tended to keep the price high; the competition of growers must now, however, so act as to reduce it." The French consul at Hankow, M. Blancheton, writes that there are in Chungking alone about 3,100 smoking shops, which pay each a license of 300 cash a month to the local magistrate. On the other hand Mr. Consul Mongan reports that, while visiting some works in the neighbourhood of Tientsin, he was much struck with the fine appearance of the soldiers and the heartiness with which they worked. The reason of this was that opium-smoking was not allowed in the camp, the men being strictly watched. The punishment for breaking the rules was slitting or excision of the upper lip for the first offence, and decapitation for the second. Thus in one part of the empire we find the magistracy deriving a large income from the permission of a practice which in another part is punished with death.

THE appointment of one and the same minister to represent the dignity of Portugal in China, Japan, and Siam, seems to imply an absence of correct appreciation of geographical distances on the part of the Portuguese Government, or unbounded faith in the physical powers of endurance of their representative. Tokio and Peking are at least twenty-one days' distance apart, and the travelling by sea and journeying by land, which a transit from the one Court to the other necessitates, are not only excessively fatiguing, but even dangerous. In point of practicability and comfort, they present greater drawbacks than any ambassador would be likely to meet with, who should combine the united charges of the legations at Rio Janeiro and Paris. Italy has, it appears, from prudential motives of economy, shown a similarly grandiose indifference to geographical distances by appointing one minister to represent her young kingdom in three empires of the far East.

The *Gazzetta di Venezia* of February 3 informed its readers that the newly accredited Japanese minister, Kavasse, left Tokio in the month of December, and may be expected about the middle or end of this month, at Rome, to present his credentials to the King of Italy. According to the *Gazzetta's* correspondent, the Mikado is assiduously devoting himself to the study of European languages; and, to the surprise of the writer and of all other foreigners in Japan who do not belong to the Great Fatherland, his Imperial Majesty has made choice of German to begin with. His subjects in the meanwhile have the opportunity afforded them, in all the upper schools of learning, to speak English, French, German, Russian, or Chinese; while, according to a recent edict, Latin and Greek are for the future to be added to the curriculum of studies incumbent on Japanese candidates for high places in the honour lists.

THE following telegram has been sent to the English papers from Cairo, dated the 16th instant:—"Dr. Beke, the English traveller, reports from the Gulf of Akabah that he has found the true Mount Sinai one day's journey north-east of Akabah. It is called by the Arabs Jebel-Nour, or 'Mountain of Light.' Its height is 5,000 feet. On the summit Dr. Beke found the remains of sacrificed animals, and lower down some Sinitic inscriptions, which he copied."

THE *Allgemeine Zeitung*, February 16, states that a letter has been received by the Grand Duke of Saxe-Weimar from the traveller G. Rohlf, dated January 8; in which he announces his arrival at Gasr in the Libyan oasis Dachel, after having opened an entirely new route from Siut to Farafrah, and thence to Gasr. The expedition had been twenty-one days on the way, travelling from sunrise to sunset each day, either on foot or on camels. The last three days the travellers had suffered great privations, having had to make their way between sand-hills from 60 to 70 metres high, without a trace of vegetation to be seen, and having had to walk over sulphurous and siliceous deposits. Near Dachel they had been gladdened by the sight of a line of rocks, through which the finest mountain-passes that they had yet encountered led them to the oasis, where the men and camels were to rest for fourteen days. Herr Rohlf was expecting fresh supplies from Siut; and when these reached him, he intended to push on to Kufra, nothing daunted by the formidable and unexpected difficulties that he had met with thus far.

FROM a letter from the Abbé Armand David, dated Kiang-si and addressed to a member of the Paris Geographical Society, we learn that this traveller, in his journey through China, has discovered that the river Hangkiang, the very name of which was until lately unknown, is by no means an insignificant stream, but, on the contrary, an important highway of commerce, traversed by vessels of every size. The lower part of the river

is wide, but studded here and there with sandbanks. The remainder of the stream is navigable, but the rapids are numerous and rocks are not unfrequent. Coal was seen to exist in two places in the south-east of Shansi and in the north-east of Houpe. The town of Kien-tchang-fu, about three leagues off, is well provided with coal, as, indeed, are all the towns passed by Père David from Kiu-kiang up to Kiang-si. He wished to measure a mountain in sight of his house, and seemingly about 10,000 feet high, but the sudden illness of two of his servants prevented him from doing so. He intends to finish his tour by a journey along the eastern parts of Kiang-si, and perhaps by a visit to Fo-kien.

MR. HALES'S MILTON LECTURE.

On Wednesday evening, at the London Institution, Mr. Hales delivered his second lecture on Milton, the special subject *Samson Agonistes*. After remarking on the long interruption in Milton's poetry-writing that followed *Lycidas*, only certain sonnets being published between *Lycidas* and *Paradise Lost*, Mr. Hales proceeded to point out the historical and biographical interest of *Samson Agonistes*, how beneath its seemingly cold classical form there beats fervently the pulse of the time that gave it birth. Take the choral song 652-709, especially 687-709, and notice the references to the brutal revenge inflicted at the Restoration on the bodies of Cromwell and Ireton, to the imprisonment of Hutchinson and Marten, to the condemnation of Vane; but the play as a whole abounds in allusions to the political reverses amidst which it was written. Milton is amazed at what he witnesses, and finds the lesson of patience hard to learn. The very name *Agonistes* is meant to refer to the moral and spiritual struggles of the hero. He wrestles with doubt. After some remarks on the Greek form of the play, and Milton's intense appreciation of Greek art, the lecturer pointed out that the play represents the figure of Samson in three attitudes—(1) forlorn and wretched, scarcely able to heave the head, ill recognisable by his friends the Danites and his father; (2) with his moral courage, and then with his physical courage returning; (3) once more as the Deliverer, with all his errors atoned for and forgotten in a glorious end; so that—

"Nothing is here for tears, nothing to wail,
Or knock the breast, no weakness, no contempt;
Dispraise, or blame; nothing but well and fair,
And what may quiet us in a death so noble."

PARIS LETTER.

4 Place Wagram, Paris, Feb. 17, 1874.

Louis Philippe was not precisely a Leo X.; the "prosperous reign" to which it has become the fashion to look back tearfully was somewhat more favourable to Bourse speculation than the gentler arts. But it will shine beside the Septennat. The Orleanist ministers are eclipsing the Orleanist king. Their short administration is already remarkable for the suspension or suppression of six score newspapers and reviews. It is characterised by a peculiar and amusing loftiness in its relations with *les gens de lettres* and the intellectual professions generally. It prohibits the performance of *Lucrezia Borgia*—as a drama;—and encourages the *Fille de Madame Angot*; it interdicts *Les Misérables*, because the purest and tenderest character in the piece is a Bishop; and it permits a nightly exhibition of nudity in the *Merveilleuses*—because the exhibition is considered to be anti-republican. With the same intelligent comprehension of literary influences it seizes almanacks because they exhibit portraits of M. Thiers; pamphlets, because the statistics they contain on the subject of the Société de St. Vincent de Paul are "irreligious;" the violent work of an ardent Monarchist, because it is called "*Le Fond de la Société sous la Commune*," and recalls "a page of our history which had better be left to oblivion." The last feat of this kind is the prosecution and condemnation of F. V. Raspail, the democratic *savant* and propagator of a new and widely popular system of medicine. M. Raspail has published annually for the last fifteen years an *Almanach Météorologique*, which was in reality a mere review of the scientific movement of the year. But under the head of *Ephémérides* it contained a little news, and it is these paragraphs that M. de Broglie considers subversive of moral order. When read aloud by the

Procureur of the Republic, the few incriminated lines merely suggested that moral order must be a rather more dangerous condition than permanent revolution if such criticisms can destroy it. M. Raspail commended the rising of 1848, suggested that the Commune did not burn all the buildings that suffered during the bombardment, and considered the summary execution of M. Millière an unjustifiable assassination. Raspail presented his own defence, and was condemned to two years' imprisonment. He received the order to appear before the Court on his eighty-first birthday. The most influential member of the jury that condemned him was M. Faye, of the Institute, whom Raspail had attacked on the subject of his theory concerning the solar spots.

This is the first remarkable achievement of the re-established Committee of Colportage—which, during the Empire, never interfered with Raspail's publications. The peculiar views of the committee with respect to what is wholesome and unwholesome in literature is evidenced by one or two other recent events. It has just authorised the publication of a new theatrical journal which its founders have with cheerful effrontery entitled *La Claque*. We know what *la Claque* means; but the means by which the institution is maintained are perhaps less familiar. The "chef de Claque"—or the editor of *la Claque*—is a theatrical power to whom *prima donna* and *soubrette* must bow alike. He has a corps—or a journal—at his command; and, thus supported, he makes his bargain with actor and actress. One salvo on entering costs so much; one round after "points" a lesser sum; a recall is expensive, and a bouquet ruinous. There is a similar tariff for hisses ordered to serve professional or private jealousy. This is the system to be openly carried on by *la Claque*, and with such a programme before them the Commission du Colportage has accorded its authorisation. But, on the other hand, political journals are rigorously discountenanced. M. Alfred Assolant, the well-known writer on England, demanded permission to publish a journal to be called the *Cri du Peuple*, and was informed that no new political prints would be allowed to appear before the passing of the new press laws.

And yet even the Governmental press is not absolutely worthless as adviser and suggestor. It has recently put forward a monster project, which the official circles of the University appear somewhat inclined to put into practice. The project is based on premises which are perhaps not indisputable, but which the orthodox professors of the left bank of the Seine are not likely to dispute. All existing encyclopaedias are imperfect or partial, it appears—that of D'Alembert being absolutely abominable. In order to fill up the chasm in learning and literature thus made more or less apparent, it is suggested that an *Encyclopédie du Dix-Neuvième Siècle* should be formed—a history of ideas, things, and men—under the presidency of the Minister of Public Instruction, and the supervision of a committee of ten literary, scientific, and artistic celebrities. Fifty contributors would be named: four members of each of the five sections of the Academy; twenty writers already known, and ten struggling *débuts*. Each contributor would receive 3,000 francs a year, plus the species of official title conferred by his nomination. Every *attaché* would be required to contribute annually fifty quarto pages—which would yield two volumes. Lastly, it is said that

two or three publishers have already offered to defray half the cost of the undertaking. This programme is seductive at first sight; but in the present condition of French parties it could scarcely result in anything better than an elaborate and pedantic attempt to refute every system of philosophy, every theory of science, every code of morals that has not received the stamp of the Ministry of the Interior and the approbation of Mgr. Dupanloup.

Who will receive M. Emile Ollivier at the Academy? The debate has been long and delicate. M. Dufaure, advocate and deputy, was originally selected; but more prudent counsels prevailed. M. Dufaure is an ardent partisan of the Thiers' government, and consequently no warm friend to Imperialism. The collision between the Minister of M. Thiers and the Minister of Napoleon III.—both of them eloquent advocates—would have made the ancient walls of Mazarin's palace ring with unacademical vituperation. M. Emile Augier was finally chosen. The dramatist has a reputation for graceful good humour, and is anything but a passionate politician. M. Ollivier intends to found a bi-monthly review whenever the state of siege shall be raised. This periodical is to resemble the *Revue des Deux Mondes*, and will be edited by the ex-Minister of the Interior.

Michalet died with his work completed. The fourth volume of his *Histoire du Dix-Neuvième Siècle* is published, and, I believe, there are but a few addenda wanting to complete the work—one of the most powerful analyses of the Bonapartes' influence in France that has yet been given to the world.

EVELYN JERROLD.

CORRESPONDENCE.

DR. LIVINGSTONE.

Vicarage, Leytonstone, Feb. 18.

A trying interval must in any case elapse before, under the most favourable circumstances, we can hear again from Lieut. Cameron and his comrades. In the meantime those who would still trust that an error has crept in somewhere, busily sift every item of correspondence to see whether any single grain of hope was cast aside in the universal distress which fell upon all at the intelligence of Dr. Livingstone's death.

Nor is it altogether unworthy of notice that private letters have come to hand in which it is shown that the doubts prevailing in this country have been preceded by strongly expressed ones at Zanzibar, entertained too by those who not only are very able to form a calm judgment, but who have free intercourse with Arabs most likely to be acquainted with all that reaches the coast in the shape of news.

On the other hand, we must confess to something like an additional pang of sorrow on reading a letter from Lieut. Murphy, which has been sent to the public journals.

The first impression left upon us as we read Lieut. Cameron's very brief narrative was, that if the men had been ever so willing to bear the body of their leader to the coast, the difficulties surrounding the undertaking would have been almost insuperable. Foremost amongst these we placed the horror that would be excited in the villages and towns on the route, to say nothing of the actual hostility which might be stirred up. Lieut. Murphy supplies the missing link in the following words:—"His followers had then subjected the body to a rough process of preservation, and were taking it with them, spite of the greatest opposition on the part of the inhabitants of the country through which they passed, whose superstitions were roused," &c. In this assertion a tone

of reality at once breaks in upon us. We observe that several comments have been made on the "rough process" of embalming adopted by the men: it is commonly asked, "Where could they procure the salt and the brandy said to have been employed for the purpose?" Now it certainly is quite true that salt can be bought of the natives in large quantities in various localities. In the vicinity of Lake Shirwa I have seen it brought for sale in packages of 40 or 50 lbs. weight, and the process of extracting it is known wherever it exists. As to preserving a dead body in salt, I deny that it is possible in Central Africa. No brandy could possibly be found by Dr. Livingstone's followers, except the small quantity reserved for medicinal purposes in his baggage: even this had in all probability come to an end before the date of his reported death.

That Cameron and his companions have dealt out to us the least possible quantity of detail, is very much to be regretted. Surely when they speak of the body being borne along in "a box," it must have occurred to them to cross-question the messenger severely on such a statement. How could a box of the dimensions required possibly be carried about by Dr. Livingstone and his followers? Failing this, we may state at once that Inner Africa does not possess a plank of which to make one, a foot long. The saw and adze are unknown, and the only substitute of any sort for a box would be a canoe. All these perplexities and many more may be rapidly dashed aside by some stern and brief facts concerning the arrival of the body at Unyanyembe, and these we are liable to receive at any moment after Monday next; but in the meantime unnecessary pain is caused by our inability to extract from the writings of the trio who sat on the messenger's story any replies to a host of obvious questions which started up the instant the reported death was telegraphed to us.

It may interest some to know that Chuma and Susi, whose names have appeared once or twice, are in all probability with the party approaching Unyanyembe.

Chuma was liberated from the slavers by Dr. Livingstone and those acting with him in 1861, upon the Shiré highlands. As a lad, he was always remarkable for his good temper and extreme bravery; boys twice his size knew it was not safe to bully Chuma, and when we remember the hardships he has undergone during the whole period of Livingstone's later travels, it would seem that his courage has stood the test of time. For the first three years of his freedom he lived with Bishop Mackenzie's party, at Margomero and Chibisáa, and he was for a short time on Mount Morambala. Here he joined Dr. Livingstone, who always took a great fancy to him. In almost his last letter to me, Livingstone stated that he wished he could afford to educate Chuma at Bombay. It is true that during his last sojourn in England the Doctor placed him under temporary instruction in India, previous to taking him back to Africa. Susi has a like time of faithful service to record. Accustomed to Portuguese ways on the Zambesi, he joined the *Pioneer* at Shupanga in 1864, and followed the fortunes of the little ship till she reached Mozambique. Here he was transferred to the *Lady Nyassa*, and in her accompanied Dr. Livingstone during his perilous voyage to Bombay. He subsequently returned to Africa with Livingstone, and has continued in his service. When one considers the inability experienced by all native Africans to share in the enthusiasm of a discoverer or geographer, and the hardships, risks, and illnesses connected with an eight years' exploration such as Livingstone's has been, we must acknowledge that pluck and endurance have been displayed by the men in a degree only second to that of their leader, and no small amount of interest will cling to them as well as to some who, although serving for a shorter time, have been tried hardly and severely enough in the regions of the Nile's sources.

HORACE WALLER.

18 College Terrace, Camden Town, Feb. 19.

In a recent number of the *Athenæum* appears a letter from Captain R. Burton, in which, after rashly accrediting "the premature death" of Dr. Livingstone, he goes on to state that "this is the third time that the heroic Scotchman has passed between the Tanganyika and Nyanza (Kilwa) lakes." From this it is evident that he revokes the statement made by him in his Supplementary Papers to the Mwata Cazembe (xxix.), that "Dr. Livingstone has marched to the interior from Buromaji on the east coast," and seeks to supply its place by other inferential proofs of the total separation of the lakes Tanganyika and Nyanza, which might be more correctly named Nyanza and Nyanja. But in order to prove this separation he boldly assumes it. The traveller, he says, rounded the southern water and marched to the southern end of Tanganyika. For this he has no authority whatever. He writes his own very erroneous conceptions. The track assigned by him to Dr. Livingstone is as far as possible from the truth. The latter, instead of "rounding" the southern lake, struck westward from it and crossed the Aroangoa, in lat. 12° 45' S.—twenty miles further south, and probably forty further west, than Lacerda's route. He then ascended to the plain of the Mbizaa, whose country (Lobisa) lies about the western affluents of the Aroangoa; thence he went north-westward, up the course of the Chambezi, to Lake Liemba, which he does not describe as a projection or branch of Tanganyika. He believed himself to be near the lake which he thus names (the Nyanza of the natives), and he seems to have learned that it turns eastward. Now, we know that if Nyanza and Nyanja be parts of one lake, the middle portion which unites them must run more or less from west to east, as described by Mr. Erhardt, from native accounts. The central portion of the lake therefore lies probably much to the east of Liemba. We know that the Thames flows from Limehouse to Blackwall, and yet a man may march in all directions and pass on dry land between those places; neither does Dr. Livingstone's march from the Aroangoa and Lobisa to Liemba prove the separation of the lakes. And it is obvious that what cannot be concluded from his march eastward receives no support from his march back again to the west.

As to Dr. Livingstone's third journey between the lakes, there is no evidence whatever that in 1872 "he passed round the southern end of the Tanganyika lake." Besides, we are not in this case reduced to rely on conjectures; we have the testimony of Mtesa, the King of Uganda, in his letter to Sir S. Baker, that in 1872 Dr. Livingstone left Ujiiji, crossing the lake to the west.

W. D. COOLEY.

THE SITE OF HOMER'S TROY.

8 Altenburg Gardens, Clapham Common,
Feb. 17, 1874.

The assumption of Dr. Schliemann that the site of *Homer's Troy* was that now known as Novum Ilium, has been long clearly disproved by a critical examination of the text in relation to the locality. Hahn settled this question to his own satisfaction, I believe, in his second visit; and Nicolaides (*Topographie et plan stratégique de l'Iliade*) has shown that no other site than Bounarbashi accords with all the demands of the Homeric text.

A geological examination of the Troad shows that no change in its river-courses of moment can have taken place, and that no river can have run between the Greek fleet on the Hellespont and Novum Ilium; while we find that in all the actions where the river is alluded to, it is implied, or directly said, that the road from the city to the fleet crossed the Xanthus. In the march on the Greek camp the left of the Trojan army is on the river; Hector, wounded before the camp, is carried in his chariot to the city, and, arriving at the river, the attendants throw water on him

Achilles, pursuing the Trojans to the city, follows them through the ford, where he kills Asteropaios, though his javelin, missing its aim, goes by and is fixed in the opposite bank; and finally, Priam, going to ask for the dead body of Hector, stops his mules and horses to permit them to drink at the river. These would have been impossible incidents if the Homeric Troy had been at the site called Novum Ilium.

If Dr. Schliemann demands in vain the name of the ruins he has found, he may be consoled with the recollection that Achilles boasts of having sacked eleven cities* in the plains of Troy, and that Novum Ilium may be any one of them. That it should be Troy itself is possible only on the supposition that Homer himself (and with him all Greek traditions of his time) was mistaken. Mauduit and Hahn found true Pelasgic walls at Bounarbashi, and Hahn himself assured me at Syra in 1867 that he was convinced that these marked the site of Troy. Homer himself may have been deceived by them, more evident in early Greek times than now, and have placed Troy incorrectly; but there is no evidence of antiquity more certain than the presence of the true Pelasgic (so-called) walls, which invariably belong to the Stone period; and if Schliemann has not found these at Hissarlik, he may be sure that the ruins at Bounarbashi are older than his, and more likely to be those of Troy, all treasures and pottery to the contrary notwithstanding; and even if he has, they cannot be referable to the Homeric tradition, which thus does not enter into the case as evidence; and we must conclude that if Dr. Schliemann has found Troy, Homer must have been as far from a clear knowledge of its true position as we are, and that in the heroic days it had already become a lost site.

W. J. STILLMAN.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Feb. 21,	1 p.m.	Sale of Mr. Graham's pictures at Christie's.
	3 p.m.	Royal Institution: Mr. Bosworth Smith's second lecture on Mohammedism.
	"	Crystal Palace Concert (Music to <i>Midsummer Night's Dream</i>). Saturday Popular Concert, St. James's Hall (Halle, Joachim).
MONDAY, Feb. 23,	8 p.m.	Gounod's Concert (St. James's Hall).
	7 p.m.	Institute of Actuaries.
	8 p.m.	Monday Popular Concert.
TUESDAY, Feb. 24,	"	Royal Asiatic Society.
	"	Society of Arts: Cantor Lecture VI., on "Fermentation."
	8.30 p.m.	Geographical.
WEDNESDAY, Feb. 25,	8 p.m.	Anthropological.
	"	Mr. Ransford's Annual Concert, St. James's Hall.
	1 p.m.	Sale of Impressions of Turner's <i>Liber Studiorum</i> , &c., at Christie's.
THURSDAY, Feb. 26,	8 p.m.	Royal Society of Literature. M. F. Boujois on "A Coin of Ichnae in Macedonia, and on Macedonian Coins generally."
	"	Society of Arts. Mr. Shirley Hibberd on "A New System of Cultivating the Potato with a view to augment Productiveness and prevent Disease."
	"	Society of Telegraph Engineers: Mr. Holmes on "Torpedoes." (Inserted in error last week.)
FRIDAY, Feb. 27,	"	Geological.
	"	London Ballad Concert.
	6 p.m.	Philosophical Club. (Willis's Rooms.)
	8 p.m.	British Orchestral Society, St. James's Hall.
	8.30 p.m.	Antiquaries. Royal.
	2 p.m.	Royal United Service Institution: Major-General Sygne on "Improvements in the Sanitary Arrangements for Barracks and Camps."
	7.30 p.m.	Creation at Exeter Hall.
	8 p.m.	Royal Institution: Mr. F. Galton on "Men of Science, their Nature and Nurture."
	8 p.m.	Quekett Club.

* Achilles' reply to Ulysses, book ix.

SCIENCE.

The Naturalist in Nicaragua. A Narrative of a Residence at the Gold Mines of Chontales; Journeys in the Savannas and Forests; with Observations of Animals and Plants in reference to the Theory of Evolution of Living Forms. By Thomas Belt, F.R.S., Author of *Mineral Veins*, *The Glacial Period in Europe*, &c. &c., with Maps and Illustrations. (London: John Murray, 1874.)

MR. BELT is a mining engineer, the author of a professional work on *Mineral Veins* (Weale, 1861), whose professional duties have taken him far and wide over the face of the earth, in North and South America, and in Australia, and who is at this moment travelling beyond the Urals on his way to the Altai Mountains on the borders of Thibet. Wherever he has gone he has had a keen and well-informed eye for all that was strange and beautiful about him, and long ago made a name among scientific men as a zealous, accurate, and accomplished naturalist. The present work is the record of his observations on the natural history of Nicaragua, during the four or five years, 1868-1872, that he was employed in that State as superintendent of the gold mines of Santo Domingo, in Chontales.

Mr. Belt was unusually lucky in having in Nicaragua a field that had never before been explored by a scientific naturalist. Many books and official reports have been written on the State in relation to the proposed interoceanic canal through the Isthmus, but excepting general descriptions of scenery in Squier's works (New York and London, 1852, 1853, for which he obtained the gold medal of the Geographical Society of Paris), and Seemann's occasional papers in the *Gardeners' Chronicle* on its flora, nothing has been done for the natural history proper of Nicaragua since the time of Oviedo (1526-56), whose special work on Nicaragua remains in fact unpublished to this day, although a French translation of the inedited MS. was published in Paris in 1840 (Fernaux-Compans, vol. ix.).

Mr. Belt's descriptions of the mimetic insect forms to be found in Nicaragua are the most interesting part of his book, and are particularly valuable in relation to the descriptions given by Bates and Wallace of similar mimetic forms among the insects of South America and the Eastern Archipelago. Amongst the most curious of these mimetic insects of Chontales, Mr. Belt describes species of *Orthoptera* which resemble green leaves, and of *Pterochroza* which resemble dry leaves in every stage of decay, and the larva of a species of *Phasma* which has a wonderful resemblance to a bit of moss. These are illustrated at pp. 381-82, where Mr. Belt writes:—

"Since Mr. Bates brought forward the theory of mimetic resemblances, its importance has been more and more demonstrated as it has been found how very largely animal life has been influenced in form and colour by the natural selection of the varieties that were preserved from their enemies, or enabled to approach their prey through the resemblance they bore to something else. So general are these deceptive resemblances throughout nature that it is often difficult to determine whether sexual preferences, or the preservation of

mimetic forms, has been most potent in moulding the form and coloration of species, and in some the two forces are seen to be opposed in their operation. Thus in some butterflies that mimic the *Heliconidae*, the females only are mimetic, the males retaining the normal form and coloration of the group to which they belong. In such cases it appears as if the females have not been checked in gradually assuming the disguise they wear; and it is important that they should be protected, as they are more exposed to destruction while seeking for places to deposit their eggs; but that both sexes should not have inherited the change in form and colour when it would have been beneficial to both can only be explained, I think, on the supposition that the females had a choice of mates, and preferred those that retained the primordial appearance of the group. This view is supported by the fact that many of the males of the mimetic *Leptalides* have the upper half of the lower wing of a pure white, whilst all the rest of the wings is barred and spotted with black, red, and yellow like the species they mimic. The females have not this white patch, and the males usually conceal it by covering it with the upper wing, so that I cannot imagine its being of any other use to them than as an attraction in courtship, when they exhibit it to the females, and thus gratify their deep-seated preference for the normal colour of the order to which the *Leptalides* belong."

Mr. Belt points out some remarkable instances of the intimate connection between insects and birds and plants. Darwin has shown that the scarlet-runner, like many other plants, is dependant for the fertilisation of its flowers on the humble-bee, and that it is provided with a wonderful mechanism, by means of which its pollen is rubbed into the head of the bee and received in the stigma of the next plant visited. Mr. Belt found that the scarlet-runners in his garden at Santo Domingo bloomed abundantly, but as none of the humble-bees of the country frequented the flowers, they never produced a single pod. The flowers of the lofty climber, *Marcgravia nepenthoides*, are disposed in a circle, hanging downwards, like an inverted candelabrum. From the centre of the circle of flowers is suspended a number of pitcher-like vessels, which, when the flowers expand in February and March, are filled with a sweetish fluid. This liquid attracts insects, and the insects numerous insectivorous birds. The flowers are so disposed, with the stamens hanging downwards, that the birds to get at the pitchers must brush against them, and thus convey the pollen from one plant to another. Many other instances are given as interesting as any described in Darwin's *Fertilization of Orchids*.

At p. 222 *et seq.*, he writes:—

"Both in Brazil and Nicaragua I paid much attention to the relation between the presence of honey-secreting glands in plants and the protection of the latter secured by the attendance of ants attracted by the honey. I found many plants so protected; the glands being specially developed on the young leaves, and on the sepals of the flowers. Besides the bull's horn acacias, I, however, met with two other genera of plants that furnished the ants with houses, namely, the *Cecropiæ*, and some of the *Melastomiacæ*; but I have no doubt that there are many others. The stem of the *Cecropia*, or trumpet tree, is hollow, and divided into cells by partitions that extend across the interior of the hollow trunk. The ants gain access by making a hole from the outside, and then burrow through the partitions, thus getting the run of the whole stem. They do not obtain their food directly from the tree, but keep brown scale insects (*Coccidæ*) in the cells, which suck

the juices from the tree, and secrete a honey-like fluid, that exudes from a pore in the back, and is lapped up by the ants. In one cell eggs will be found, in another grubs, in a third pupae, all lying loosely. In another cell, by itself, a queen ant will be found, surrounded by walls made of a brown waxy-looking substance, along with about a dozen *Coccidae* to supply her with food. I suppose that the eggs are removed as soon as laid, for I never found any along with the queen ant. If the tree be shaken, the ants rush out in myriads, and search about for the molester. This case is not like the last one, where the tree has provided food and shelter for the ants, but rather one where the ant has taken possession of the tree, and brought with it the *Coccidae*; but I believe that its presence must be beneficial."

Several other facts of the same kind are stated, and Mr. Belt concludes that these trees attract insects that will protect their leaves and flower-buds from being injured by herbivorous insects and mammals. But the greatest destroyers of tropical vegetation are insects, the leaf-cutting ants:—

"The ceaseless, toiling hosts impress one with their power, and one asks—What forest can stand before such invaders? How is it that vegetation is not eaten off from the face of the earth? . . . Further acquaintance will teach the enquirer that just as many insects are preserved by being distasteful to insectivorous birds, so very many of the forest trees are protected from the ravages of the ants by their leaves either being distasteful to them, or unfitted for the purpose for which they are required, while some have special means of defence against their attacks. *None of the indigenous trees appear so suitable for them as the introduced ones. Through long ages the trees and the ants of tropical America have been modified together.* Varieties of plants that appeared unsuitable for the ants had an immense advantage over others that were more suitable; and thus through time every indigenous tree that has survived in the great struggle has done so because it has had originally, or has acquired, some protection against the great destroyer."

Mr. Belt's description of his garden at Santo Domingo might be the description of a garden in Western or Southern India, and impresses the reader with a sense of the services of the Portuguese in introducing the fruits, and vegetables, and flowers of tropical America into India, and of India into America during the time of their power in the East. The cashew-nut, the custard apples (*Ram-phul* and *Sita-phul*), papai, guava, pine-apple, maize, tobacco, and chilies are the widest-spread and commonest productions of Indian orchards and kitchen-gardens, and were all, excepting perhaps tobacco, introduced by the Portuguese into India from the West Indies and South America, to which they carried back in return the plantain, banana, and mango. Oranges and the sugar cane, which had been introduced from India and the East into the Mediterranean countries by the Arabs, were also carried on to America by the Portuguese. The plantain, date, and rice were probably the primeval food of man in Asia, and Mr. Belt believes that from the most ancient times maize has been the principal food of the people of the Western side of tropical America. On the coast of Peru, Darwin found heads of it, along with recent sea-shells, on a raised beach eighty-five feet above the level of the sea, and in the same country it has been found in tombs more ancient than the

times of the Incas. In Mexico it was known from the times of the earliest picture writings of the Toltecs. The number of its cultivated varieties, as in the case of rice and plantains, is another proof of the antiquity of its use as food by man. In the presidency of Bombay there are about 50 varieties of cultivated rice, in Ceylon 160 distinct varieties have been recognised, whilst it is said that the number exceeds 300 in southern India. Such facts are well worthy of closer and more accurate observation than they have yet received. A positive knowledge of the number of varieties of the species of fruits and grains cultivated up and down the earth as the chief food of the human race, would afford the best attainable comparative measure of the antiquity of man.

Mr. Belt has very little to say of the people of Nicaragua, but the few remarks which he makes on the long debated proposal for a canal from the Atlantic to the Pacific Ocean, through the Isthmus, are most pertinent. The United States Government has sent out several expeditions to survey the Isthmus with the view of piercing it, and appointed one commission after another to report on the projected scheme, but owing to the engineering and other difficulties in the way, has never yet been able to do or even seriously propose anything about it. Mr. Belt advises that, instead of cutting a canal from the head of the delta of the San Juan to the sea, as has been proposed, the Colorado branch might be straightened and dredged to the required depth. Higher up, the Torre Castillo and Machuca Rapids form natural dams across the river. These might be raised, locks formed round them, and the water deepened by dredging between them. In this way the great expense of cutting a canal, and the fearful mortality that always arises amongst the labourers when excavations are made in the virgin soil of the tropics, especially in marshy lands, would be greatly lessened between the lake (of Nicaragua) and the Atlantic. Another great advantage would be that the deepening of the river would be effected by steam power, so that it would not be required to bring such a multitude of labourers to the isthmus as would be necessary if a canal were cut from the river; the whole track, moreover, passes through virgin forests rich in inexhaustible supplies of fuel. Mr. Belt, as a student of natural history, has here been able to weigh against the physical difficulties, of which engineers are apt to make so much, the wonder-working power of perseverance. All the best scientific engineers pronounced the Suez Canal to be impossible, but by simple perseverance it is now a fact. The London Underground Railway also was carried through, by sheer perseverance, by the hands of the very engineer who had reported, on strictly scientific grounds, against undertaking it. The United States might, therefore, begin with their Nicaragua Canal, and arrange the preliminaries afterwards.

Mr. Belt has some remarks on the droll custom of the "couvade" amongst the Carib races of America, which it would have been interesting to quote had space remained. He has also a startling glacial theory of his own, open to serious objection, and a novel

theory of cyclones which should stimulate fresh enquiries into their nature. But it is his observations on the entomology of Nicaragua, and particularly as illustrating the researches of Darwin and Wallace, and Bates's theory of mimicry in insects, which give Mr. Belt's book its real and lasting value. It is impossible to speak too highly of its interest to the general reader. It is full to overflowing of romance, simply and brightly told, of the teeming and radiant life of the tropics—a delightful book for both young and old, simple and learned.

GEORGE BIRDWOOD.

ON NASALISATION.

Die mit Nasalen gebildeten Praesensstämme des Griechischen, mit vergleichender Berücksichtigung der andern Indogermanischen Sprachen. Von Dr. Gustav Meyer. (Jena: Mauke's Verlag, 1873.)

THIS is a carefully written essay on an interesting and important feature of Aryan grammar, viz. the development of roots by means of nasals. The subject has been treated before, but not so fully. The first who discovered the real nature of nasalisation, and showed its grammatical function to be in many respects analogous to what we call Guna, was Lepsius. Though there is much that is fanciful in his two linguistic essays, published as long ago as 1836, yet it has been a real loss to the science of language that this eminent scholar has since devoted himself almost entirely to Egyptology. We want men of original thought, men who venture to step out of the beaten track, men who can give an impulse, and who, even if their views should prove to be mistaken, can by their suggestions stir up new life, strengthen old convictions, and bring our study more into connection with the great problems of the day. We want a little more fresh air, and now and then a whiff of a new idea.

Dr. Meyer, we are glad to see, has the courage of his own opinions. He has, for instance, freed himself almost entirely from the baneful influence of a theory which pervades so many books published on Comparative Philology during the last twenty years. All variety in language is accounted for as the result of phonetic change. Grammatical terminations, suffixes, and even roots that show any similarity, are traced back genealogically to one original form, and treated as successive stages in a purely phonetic development. It seems entirely forgotten, that there is in language a *Nebeneinander* as well as a *Nacheinander*, and that when there is one form in language, there are many others equally possible. It is true, for instance, that the suffix *vat* answers exactly the same purpose as *mat*; it is true also that these two suffixes are used, respectively, according to the letters by which they are preceded, i.e. according to phonetic reasons. But does it follow, therefore, that *mat* became *vat*, or *vat* became *mat*? Must we admit in Sanskrit a phonetic change of *v* into *m*, or *m* into *v*, in order to explain parallel forms such as *agni-mat* and *gnāna-vat*? Such a view is quite legitimate in a grammar based on such principles as those of Pāṇini (see my *Sanskrit Grammar*

2nd ed. p. 85; Pāṇini, viii. 2, 9-16), but it is without any justification in a truly scientific treatment of Sanskrit. The people who spoke Sanskrit did not either suddenly or gradually change *m* into *v*, because the last letter of the base was *a*, and not *i*; but they used either the one or the other suffix, both of which were ready at hand, in accordance with certain phonetic idiosyncrasies. To admit the general possibility of a phonetic change from *m* into *v*, would be to unsettle the whole phonetic structure of Sanskrit. There are, no doubt, purely phonetic changes—changes where one letter lapsed into another. Nearly all the changes which turned Latin into French are phonetic. All the modifications that took place in Greek, owing to the disappearance of the two semi-vowels *y* and *v*, and owing to the loss of *s* between two vowels, are phonetic. In Latin the change of *r* into *l* is phonetic. The use of *alis* instead of *aris*, in such adjectives as *moralis* and *molaris*, is phonetic. But although it might seem that the use of *mat* in Sanskrit *yava-mat*, instead of *yava-vat*, was influenced by the same phonetic considerations as the use of *alis* in *moralis*, instead of *moraris*, yet, looked at from an historical point of view, the two cases are by no means analogous. *Aris* was changed into *alis*; *vat* changed places with *mat*. Or to take another case. If we find among the terminations of the second person singular such forms as *si* and *s*, we have a right to treat the simple *s* as a phonetic modification, as a later or secondary form of *si*. But when we come to such forms as *θi*, Sanskrit *dhi* and *tha*, then we have to deal with parallel forms, and to say that *θi* and *dhi* and *tha* and *si* are all successive phonetic corruptions of an ideal form *tu* or *tva*, would be doing violence to the genius of every single one of the Aryan languages. If *tu* was possible, or *tva*, *tha* also was possible, and *dhi*; and to suppose that people who first said *tva* allowed themselves after a time, from mere want of muscular energy, to say *dhi* or *si*, is to ignore a fact which I hope I have proved in my *Lectures on the Science of Language* (7th ed., vol. i. p. 51), viz. that phonetic change explains indeed the successive modifications of language, but not that collateral variety of form which is *dialectic*, in the widest sense of the word.

Why I have always so strongly insisted on this point is not because, without realising the true meaning of these two principles of growth inherent in all languages, viz. *phonetic decay* and *dialectic growth*, we form a wrong theory of the life of language altogether, but because of the practical consequences which flow from such one-sided views. The truly phonetic changes in the history of language are governed by laws wonderfully strict and minute. But the changes which we should have to admit, if treating all dialectic variety as purely phonetic, would defy all rule and system. If we once admit that in Sanskrit *v* is a weakened form of *m*, then the first person dual in *vas* would be a mere weakening of *mas*, and *vad*, to speak, a modification of *mad*, to rave. If in Sanskrit *s*, *dh*, and *th* can be treated as various phonetic corruptions of one common type *tu*, then all the dykes are broken, and the etymological floods will again cover the land. If people can imagine

that *da-dā-si* and *dadi-tha* and *de-hi* were all originally *dada-tva*, this is a matter of theory, in which argument is perhaps of little avail. But in that case, there should be, at all events, a broad line of demarcation drawn between phonetic changes, supposed to be possible in a kind of pre-historic period, and those other phonetic changes which govern the real history of language.

Dr. Meyer shows by abundance of evidence that the nasal suffixes, the so-called Vikaranas of verbal bases, are in their nature the same as the nasal suffixes of nominal bases. Bopp expresses the same opinion, when he says: "From the roots spring verbs and nouns, which stand in fraternal connection with the verbs, not in the relation of descent from them, not begotten by them, but sprung from the same source (not, as Mr. Eastwick translates, from the same shoot, German *Schooss*)." As we have *nu* in *dhriṣṇu-mas*, we are bold, we have *nu* in *dhriṣṇu-s*, bold; as we have *na* in *vri-nanti*, they cover, we have *na* in *var-na-s*, colour, &c. So far, we fully agree with Dr. Meyer. But if he goes beyond, and tries to represent *nu* as a phonetic corruption of *na*, he seems to forsake the very principle which he had acknowledged, and to forget that the same process which accounts for a suffix *na* would likewise account for another suffix, *nu*. Does he really believe that the accented *u* in *āsú*, *ākú*, quick, the accented *nu* in *ta-nú*, *ra-rú*, thin, are corruptions of *a* and *na*?

In Sanskrit the roots which form their verbal bases by the addition of a nasal element, are the Su-class, the Tan-class, the Kri-class, and the Rudh-class. The first comprises about 35 roots, the second 11, the third 50; the fourth, which stands by itself, about 25 roots.

The first verb of the Su-class is *su*, which forms its special base *su-nu*, and from it its present, *su-nó-mi*, I pour out.

The first verb of the Tan-class is *tan*, with its special base *tan-u*, forming its present, *tan-ó-mi*, I stretch.

The first verb of the Kri-class is *kri*, its special base *kri-na*, its present *kri-ná-mi*, I buy.

Although Sanskrit grammarians distinguish between verbs of the Su- and Tan-classes, Dr. Meyer has well shown that that distinction is purely artificial. As the verbal suffixes *nu* and *u* appear in the so-called special tenses only, in the Present, Imperfect, Optative, and Imperative, it is clear that the chief reason why Sanskrit grammarians established a separate class of Tan-verbs was their not recognising the existence of any roots ending in short *a*. The Tan-class therefore was originally intended to comprise all such roots as had a short *a* before the verbal suffix. Unless Pāṇini had imagined a root *tan*, forming *tan-ó-mi*, he would have been driven to admit a root *ta*, forming *ta-no-mi*, i.e. he would have been driven to admit the existence of about eleven roots ending in short *ā*. It was for the same reason that he invented such bases as *dhe*, *dhay-ati*, instead of *dha*, *dha-ya-ti*, of the Div-class. In the general tenses, roots ending in short *a* are developed in Sanskrit into roots ending in *ā* or in *an*; but besides these two modifications, we also find in the Tan-class single forms in which

the original base in *ā* is preserved. Thus we have from the base *ta* the participle *ta-tas*, the Aorist *a-ta-ta*; from the base *tan*, the Perfect *ta-tān-a*, the Passive *tan-yate*; from the base *tā*, the Passive *tā-yate*. There is but one root which really has the verbal suffix *u*, viz. *kar*, in *kar-ó-mi*, &c. But here, too, there is no necessity for supposing that *kar-ó-mi* is a phonetic corruption of *kar-nó-mi* or the Vedic *kri-no-mi*, as little as *dhriṣṇu*, bold, has to be derived from *dhriṣṇu*.

The suffix of the Kri-class is, as Dr. Meyer has well shown, *na*, and not, as Bopp supposed, *nī*. This suffix *na*, if strengthened, appears as *nā*; if weakened, as *nī*. If more evidence were wanted to prove this against Bopp and against Pāṇini, Dr. Meyer need not have appealed to such doubtful forms as *grihnate* for *grihnāte*, *gānate* for *gānāte*, *prushnate* for *prushnāte*. The most ordinary forms, such as *krinānti*, *ākrinān*, *krinānta*, *krināthe*, *ākrināthām*, &c., all presuppose a special base in *n(a)*, for forms like *krinānti* may stand for *kri-na-anti* (cf. *bodhanti*), but never for *kri-nī-anti*.

I call the forms to which Dr. Meyer appeals doubtful, because *grihnate* occurs in a passage which may be either very old or very modern, and is most irregular metrically. *Prushnate* does not stand for *prushnāte*, but is a dative singular of the participle present. *Gānate* (Mahābhārata, xiii. 5204) is probably the third person singular, and is taken by native commentators for *gānāte*. But if it were absolutely necessary to eliminate such a form, it could be done. The epic style in Sanskrit allows sudden transitions from the singular to the plural (see, for instance, Mahābhārata, xiii. 4896), and *gānate* might, though not without an effort, be taken for the third person plural.

We hope that Dr. Meyer will continue his useful researches, particularly in Greek. There are a few mistakes with regard to Sanskrit which we may mention in conclusion. *Hinvati*, quoted on page 39, is not a Vedic form. In Rv. i. 84, 11, the right reading is *hinvanti*. In my own *Index verborum hinvati* should be changed to *hinvanti*. *Tanvate*, quoted on the same page from Rigveda i. 115, 2, is the third person plural, and so is *manvate*, Rv. x. 2, 5.

MAX MÜLLER.

PROPOSED CHANNEL RAILWAYS.

THE project of connecting the railway systems of this country and the Continent has, for a great number of years, occupied the attention of several engineers both here and abroad. As early as 1834 a project was discussed for the construction of a submerged tunnel. It was to be of iron, and built up in lengths which were to be lowered down to the bottom, and were to rest in places prepared for them by dredging. Among the principal objections to this project were the inequalities of the bottom and the great expense of leveling them. The total estimated cost at the time was 18 millions sterling. In 1836 the possibility of building a tunnel on the bottom by means of an advancing shield was contemplated. This plan was soon dismissed, from the great risk attending such a hazardous mode of working. Perhaps the most extravagant project of all, with the exception of that proposed in 1868 of crossing the Channel with a bridge of ten spans, was that suggested by a French engineer—to build a granite and syenite arched bridge of the enormous breadth of 131

yards. The abandonment of the scheme was advised by English engineers, as the probable cost was upwards of 200 millions sterling.

In 1838-9 the project of a tunnel under the Channel was considered, and geological enquiries were prosecuted.

From 1842 to 1855 M. Thomé de Gamond carried on investigations as to the character of the strata in the neighbourhood of the proposed site, and made repeated examinations of the bottom. On one occasion when diving naked, ballasted with flints, to a depth of a hundred feet, he was attacked and badly bitten by conger eels. The tunnel scheme has of late years received considerable attention from the present promoters, Messrs. Hawkshaw, Brunlees, Thomé de Gamond, and others. A boring has been made at St. Margaret's Bay, near the South Foreland, and another about three miles to the west of Calais. As the results of these borings, it has been established that on the English coast the chalk extends to a depth of 470 feet below high-water level, consisting of 175 feet of upper or white chalk, and 295 feet of lower or grey chalk, and that on the French coast it extends to a depth of 750 feet below the level of high water, 270 feet being upper or white chalk, and 480 lower or grey chalk. One of the proposals is to carry a tunnel from a point a little on the north-east of Dover, through the lower or grey chalk, which is presumed to be continuous across the Channel, to a point about three miles to the westward of Calais. There are two important elements of danger in the construction of the proposed tunnel. The first involves the question of the formation of the Straits of Dover; the second the amount of water that would find its way into the workings. If the channel was formed by a fault or dislocation of the chalk, owing to great zoological disturbance, there would probably be fissures of such size, and extending to so great a depth, as to render the construction of a tunnel through that rock an extremely hazardous if not an impossible undertaking. If, however, the channel was formed by a local subsidence immersing the pre-existing isthmus, and was afterwards widened by the action of the currents and waves, there is no reason why the chalk under the channel should be more treacherous than that on the two shores. Even if the continuity and unbroken character of the chalk were established, there would still remain a great source of danger in the great number of fissures which are known to traverse it in every direction. If the fissures met with were so small that the influx of water through them was so reduced by friction as to be manageable by the pumping arrangements that could be made, nevertheless, when they were finally closed, the statical pressure of the water on the outside of the tunnel would be equal to that of a depth of water equal to the height of the surface of the channel above the tunnel.

No practicable thickness of brickwork would probably suffice to keep out water under this pressure, and we should be obliged to have recourse to a cast-iron casing for the tunnel, on account of the risks mentioned of carrying out the work in the chalk. Different lines for the proposed tunnel through other formations have been discussed. If a point be taken on the English coast, about three miles to the south-west of Dover, and another point about the same distance in a south-westerly direction from Calais, a line joining these two points is supposed to represent the outcrop of the lower surface of the chalk at the bottom of the channel. That is to say, on the north-east side of this line we have, on either shore, a bed of chalk 600 or 800 feet in thickness, sloping down at a small inclination in the north-easterly direction, and this chalk is supposed to be continuous between the two coasts. On the south-west side of this line a layer of gault, usually about 100 feet thick, comes to the surface on either shore, running down under the chalk on the other side of the line, and is supposed to form

the bottom of the channel for a small width along this line. If now another line be drawn from a point between Hythe and Folkestone to one on the French coast, two or three miles to the north of Cape Griz Nez, the area enclosed between it and the gault is supposed to be occupied by the Lower Greensand, this formation being present on the two shores between the points indicated. If again a point be taken on the English coast in Dungeness Bay, the part of the shore marked off between it and the Greensand is occupied by the Weald clay, while the corresponding portion on the French coast, as far as Boulogne, is occupied by an older formation, the Oolite, thus showing that the Weald clay does not extend all across the Channel, but thins out and is lost. These formations, the Wealden and Oolite, being more safe for tunnelling under water, a line has been proposed for the tunnel, in spite of the much greater distance, between Dungeness and Cape Griz Nez. There is still another line, for which many advantages are claimed, which has been proposed for the tunnel to connect England with the Continent, viz. one through the Palaeozoic or older rocks which underlie the chalk. These rocks, consisting of Silurian slates, Devonian and carboniferous limestones, and coal measures, together twelve or fifteen thousand feet thick, are exposed at the surface in Belgium, are supposed to pass under the chalk in the north of France, reappearing in the Boulonnais, and are then lost under the newer formations near the coast, not coming to the surface again until they reach Somersetshire. Although covered by Tertiary strata, chalk and greensand, these Palaeozoic rocks have been met with in boring at a depth of 1,113 feet at Kentish Town, 1,025 feet at Harwich, 985 feet at Ostend, 1,032 feet at Calais, and 663 feet at Hames, near Calais. They thus seem to form a subterranean table-land immediately underlying the chalk formation, and it is expected that they would be met with at a depth not exceeding 600 or 700 feet in the neighbourhood of Dover. Now, in the north of France where the coal measures are worked at a depth of 900 or 1,000 feet under some strata charged with water, it is found that the overlying beds of lower chalk and gault so effectually keep the water out of the workings that they are carried on with complete safety in that respect. There appears then to be no difficulty, from a geological point of view, in carrying a tunnel through the Palaeozoic rocks between France and England. There still remain, however, the engineering difficulties in constructing a work of such a length, increased as it would be by the long inclines rendered necessary in order to reach so great a depth.

A. T. ATCHISON.

NOTES AND NEWS.

SOME of the American newspapers are now printed upon paper which is made from a reed-like grass (*Arundinaria macrosperma*). The way in which this material is prepared for the manufacture by the Fibre Disintegrating Company would be too improbable for a hoax if it were not known to be a fact. The bundles of reeds are crammed into a metal cylinder, in which they are exposed to the action of steam at a high pressure, with which accordingly they become thoroughly permeated. They are then suddenly released, and, by the expansion of the steam, are not merely violently projected *en masse* against a sort of target placed to receive them, but at the same time are thoroughly disintegrated by the instantaneous dilatation of the compressed steam which has penetrated every part. A bundle of reeds is in this way converted into a disc of fibrous paper-pulp. There is something delightfully millennial in utilising artillery practice for literary purposes.

At the sitting of the Institut Egyptien on December 19, Dr. Schweinfurth pointed out that many of the cultivated plants which are not known in the wild state in Lower Egypt are re-

presented by identical or nearly allied spontaneous forms in the countries adjoining the Upper Nile. The common Luffa, or washing-gourd (the fibrous skeleton of the fruit of which is sometimes sold in this country as a substitute for sponge), is wild in Central Africa, and only known as cultivated in Egypt. He finds the origin of the vine of Egypt in a wild Abyssinian species. The olive he seems inclined to refer back to the shores of the Red Sea; while the sycamore, doum palm, and date all seem to him to belong, in their wild state, to the south. From the remarkable but well-known fact that the lotus (*Nelumbium*) has disappeared from the whole Nilotic region within historic times, and that the papyrus is not now found beyond 9° N. lat., he arrives at the conclusion that the climate of Egypt has lost the characteristic features which formerly united it with that of tropical Africa; and that the natural productions of the country have gradually become more northern.

PROFESSOR PANCERI made an interesting communication to the Institut Egyptien at its meeting on December 13, on the cryptogamic vegetation which he had found within the egg of an ostrich. This egg had been given him at Cairo, and was still fresh, the air space having not even been formed. He soon, however, noticed the appearance of dark blotches within the shell, and having broken it open to ascertain the cause, he found that they were produced by the growth of minute fungi. Instances of a similar kind had already been studied by him, and he had communicated the results to the Botanical Congress held at Lugano in 1859. The believers in the reality of the spontaneous generation of living organisms have not been slow to seize on these cases as an argument in their favour, since *a priori* it would seem that the shell of an egg would be quite impermeable to germs derived from without. Panceri has succeeded in satisfying himself, however, that the unbroken shell of an egg is permeable to liquids, and that these may introduce germs into its interior. He has, in fact, actually succeeded in inoculating other eggs with a fungus which he had obtained from the interior of one in which it had made its appearance in a way apparently so mysterious. He cultivated the fungus in egg albumen, and thus conveyed it to the uncontaminated eggs.

THE ill-fated *Polaris* advanced up Smith's Sound, the northern continuation of Baffin's Bay, to the latitude of 82° 16', which is a point nearer to the Pole than any ship had ever previously reached. Even this, however, did not lie within the zero-line of vegetable life, or even the northern limit of vegetable-feeding animals. No fewer than fifteen species of plants, five of which were grasses, were collected at the highest latitude reached by the ship. Dr. Bessels gave to Captain Markham four flowering plants collected in lat. 82°. They were, *Draba alpina*, *Cerastium alpinum*, *Taraxacum Dens-leonis*, and *Poa flexuosa*, all common Arctic plants. Twenty-six musk-oxen were shot in lat. 81° 38'. Dr. Bessels also made a fair collection of insects, principally flies and beetles, two or three butterflies and mosquitos; and birds of seventeen different kinds were shot in 82°, including two Sabine gulls and an Iceland snipe. It is just as well perhaps to mention, lest these facts should seem to give a too favourable notion of the climate, that the lowest winter temperature registered at 81° 38', was - 48° Fahr., with very little wind blowing.

THE *Kölnische Zeitung* of January 28 announces that an almost perfect and entire skeleton of Palaeotherium has been found at Michel, near Vitry.

SOME wonderful discoveries in fossil remains lately made in Kansas and Wyoming in the United States are described in a letter from Professor Hayden, which appears in the *New York Herald*. At least seventy species are new to science, ranging from the size of the mole nearly to that

of the elephant; sixteen species only are reptiles. Many forms of the insectivorous animals related to the mole, and of very small size, have been procured. Gnawing animals, or rodents, left numerous remains of eighteen species, some not larger than the modern domestic mouse. Of cloven-footed quadrupeds, a great many species have been found. Some are nearly intermediate between the hog and the deer in structure. Others are about the size of grey squirrels. The most remarkable monsters of the past whose existence has been disclosed by the present survey are a series of horned species related to the rhinoceros, but possessing some features which resemble the elephant. They stood high on the legs, and had short feet, but possessed osseous horns on different parts of the head. One of the largest species had a horn over each eye, while another had one on each side of the nose, and more than a foot in length; a third one, of large size, had rudimental horns on the nose. Another was about as large as an elephant, with enormously expanded cheek bones and flat horns; a fifth species had triangular horns turned outwards. There were also tiger cats and dogs as large as the black bear, some of the cats with remarkably large eye-teeth; one kind of cat, indeed, had teeth like those of a shark, a fact tending to show probably that the mouse of former days must itself have been a formidable animal.—*Pall Mall Gazette*.

The following is a table of the new Japanese coinage. Its accuracy may be relied on, as it comes from the hands of Mr. C. Tooke, late Chief Assayer of the Mint at Yeddo:—

Gold.		
Denomination.	Permitted Range of Weights—Grains.	Fineness.
20 <i>yens</i>	513.91 to 514.91	— $\frac{900}{1000}$
10 "	256.70 to 257.70	— "
5 "	128.10 to 129.10	— "
2 "	51.19 to 51.69	— "
1 "	25.47 to 25.97	— "
Silver.		
1 <i>yen</i>	414.50 to 417.50	— $\frac{800}{1000}$
Standard Weight.		
50 <i>sen</i>	208.00	— $\frac{800}{1000}$
20 "	83.20	— "
10 "	41.60	— "
5 "	20.80	— "

The silver *yen* of standard weight, 416.00 grains, and fineness $\frac{800}{1000}$ is of the same value as the average Mexican dollar. The subsidiary silver coins have a similar relative value to the silver *yen* as the English silver coins have to the sovereign. A large proportion of the subsidiary coins—viz. those first issued—were of less weight than those issued at the present time; the 50 *sen* piece weighed only 193.00 grains, and the rest in proportion; so that a very large (temporary) profit was made by the Government.

The old coinage of the country—viz. the rectangular silver and so-called gilt coins—have nearly disappeared; also the *kobans*. The fineness of the latter given in Martin and Trübner is $\frac{651}{1000}$, but one examined in Hongkong gave only $\frac{651}{1000}$. All the gold coinage consists of alloys of gold and silver with small (accidental) quantities of copper. For example, the *nibu* (two *bus*) contained almost unvarying proportions (gold 227 (silver 760)

—987 in 1,000. These were coined by the Tokugawa dynasty, which was deposed in 1868. The debasement of this coin was carried as low as 47 parts of gold in 1,000.

DR. A. VON KÖLLIKER has declined to accept the chair of anatomy at the University of Bonn rendered vacant by the death of Dr. Max Schultze.

DR. VICTOR CARUS has completed his translation of Darwin's *Variation of Plants and Animals under Domestication*, the appearance of which in a German form is hailed with satisfaction by the large number of scientific men in Germany who have given in their adhesion to Mr. Darwin's views.

THE Royal Agricultural Society of England have decided to grant the sum of 100*l.* towards assisting Professor de Bary, of Strassburg, in the investigation of the life history of the potato fungus (*Peronospora infestans*).

THE Council of the Institution of Civil Engineers invite communications from its members dealing in a complete manner with subjects, among others, on Sanitary Engineering, such as the following:—The constant service of water supply, with special reference to its introduction into the metropolis, in substitution for the intermittent system; and on the waste of water, and the best apparatus for its prevention. The various modes of dealing with sewage, either for its disposal or its utilisation. The separate system of sewerage towns, with a detailed description of the works in a town to which this system has been wholly or partially applied, and particulars as to the results. The ventilation of sewers, with a *résumé* of the experiments as to the motion, pressure, &c., of gas in the sewers. We are asked to state that supplemental meetings for the reading and discussion of Papers by Students of the Institution have been appointed for the following Friday evenings:—February 27, March 6, 13, 20, and 27. The Papers to be read on these evenings are respectively "On Coal Gas," by Mr. G. E. Page; "The Lisbon Steam Tramway," by Mr. M. Curry, jun.; "The Sewage and Drainage of Towns," by Mr. W. H. Cobley; "The Construction of Tanks," by Mr. J. C. Inglis; and "On setting out a Line of Railway," by Mr. J. C. Fergusson. The chair will be taken at 7 o'clock on each evening, and successfully by Dr. Pole, F.R.S., Mr. Bruce, Mr. Bazalgette, C.B., Mr. Bateman, F.R.S., and Mr. W. H. Barlow, F.R.S.

STUDENTS of Chinese literature, both in Europe and in the East, will be glad to learn that ere long the British Museum will afford them facilities for study which have not hitherto existed. The curator of Chinese books (Mr. R. K. Douglas, formerly of Her Majesty's Consular Service in China) has for some time past been diligently employed on a Catalogue, which was much wanted to make the valuable Chinese Library of the Museum fully available to students. With regard to this Catalogue, it was resolved, after careful consideration, to adopt Morrison's system of writing the sounds, as being the most widely known. The works are catalogued under the authors' names, and the English sounds of these names, preceded by the Chinese characters, are arranged alphabetically. In order, however, to enable the student to find any book, even though he does not happen to know the name of its author, an index will be added, containing the titles of all the works alphabetically arranged, but without the Chinese characters, with references to the authors' names in the body of the Catalogue. As may be imagined, the labour involved in preparing this Catalogue—containing about 15,000 entries—for the press, has been very great, the more so when we consider that the curator has been totally without Chinese assistance. When the Museum authorities determined to print the Catalogue, they asked for tenders for the execution of the work, and, as will have been gathered from the ACADEMY of January 24, accepted that made by Messrs. Austin & Sons, the enterprising printers of Hertford. That firm having procured a small fount of metal type from Shanghai, the difficulty of setting up Chinese type in England has been overcome by numbering them; and, as numbers are placed over the characters in the MS. catalogue, the compositors really have nothing to do with the Chinese characters. To ensure accuracy, the proofs have, of course, to be carefully revised two or three times before they can be finally sent to press, and consequently, though about a quarter of the Catalogue is already set up, it is hardly expected that the work will be ready before the early part of next year. We understand that 500 copies will be struck off, of which

some will be distributed amongst the various libraries of Europe, and the rest will be offered to the public.

WE learn that the American teachers of the deaf and dumb employing Professor A. Melville Bell's system of visible speech as a means of instruction in articulation, meet in convention at Worcester on Saturday, the 24th inst., for the purpose of discussing plans for the advancement of the system. Measures will be taken for the establishment of a periodical devoted to the interests of visible speech, and altogether the meeting promises to be interesting. This system, by means of which the dumb are taught to speak, was introduced into this country from England in 1871 by the Boston Board of Education. Since that time it has spread into seven American institutions, and a normal training school for articulation teachers, conducted by Professor A. Graham Bell (son of the inventor), has been established in this city in connection with the Boston University.—*Boston Globe*, Jan. 17.

IN concluding, for the present, his studies on the Sibylline Books, M. Delaunay has examined the grounds on which the *proemium* has been held to be composed of fragments of Christian origin, pointing out that all the doctrines held in these passages were already current among the Jews of Alexandria. Such were the doctrine of the Spirit, that of the judgment and a future life, the bread of life or Word of God, &c. As to the manifestation of God to the world, spoken of in v. 28-30, M. Delaunay explains that the Jews believed that the reign of Messiah then expected would be preceded by a general conversion of the Gentiles, through the preaching of the Jews, which should manifest to the world the existence of the true God. The Sibyllist believing that the reign of Messiah was close at hand, and seeing the Jews widely dispersed through the world, thought that the epoch of this manifestation was come. The *proemium* therefore contains nothing distinctively Christian, and may well be anterior to our era. As to the so-called Sibylline books in general, he concludes that the collection we now have does not reproduce the *form* of the old Alexandrine oracles (unless Book iv. may be so considered); these were short, imitating the language and style of the Pagan oracles, and of these Book iii. presents us with diverse fragments of different ages and dates.

DR. JOHN MUIR has presented to the University of Glasgow the sum of 100*l.*, to be awarded as a prize for Hebrew scholarship and the critical study of the Old Testament. Names should be given in on or before October 1, 1874; and the subjects of examination are as follows:—I. The Structure of the Hebrew Language, with translations from English into Hebrew, in illustration of Hebrew idioms: II. The Books of Genesis, Deuteronomy, and Samuel, and Jeremiah: III. (1) The Composition of Genesis; (2) The Relation of Jeremiah to Deuteronomy; (3) The Masoretic and Greek Texts of the Book of Samuel: IV. The Gospel of Matthew in Syriac (Bagster's edition).

THE Section of Humanities of the Philosophical Faculty of Strassburg University has conferred the degree of Doctor Philosophiae, *Honoris Causa*, on Mr. A. C. Burnell, of the Madras Civil Service, now at Mangalore. This is the first degree conferred by the University since its foundation, and is as honourable to the Senate of the University as it is to the recipient, who holds rank amongst the first of living Sanskrit scholars.

MESSRS. STEPHEN AUSTIN & SONS, the Oriental printers of Hertford, have requested us to say that, of the books we mentioned as now in their press, Professor Palmer's *Arabic Grammar* is printing for Messrs. W. H. Allen & Co., of 13 Waterloo Place; and Professor Childers' *Pali Dictionary* and Mr. Bendall's translation of

Schleicher's *Comparative Grammar of the Indo-Germanic Languages*, for Messrs. Trübner & Co., of 57 and 59 Ludgate Hill.

MEETINGS OF THE WEEK.

ROYAL HISTORICAL SOCIETY.

ON the evening of Monday, the 16th inst., Mr. Thomas Morgan read a paper entitled, "Old Found Lands in North America," and Dr. Rogers, the secretary, read a paper by William Kelly, Esq., on "The Great Mace and other Corporation Insignia of the Borough of Leicester."

LONDON ANTHROPOLOGICAL SOCIETY.

AT a meeting of this society, held at 87 Arundel Street, Strand, on the 17th inst., Dr. R. S. Charnock, F.S.A., president, in the chair, the following paper was read:—"On the Castellieri of Istria," by Capt. R. F. Burton, V.P.L.A.S. For years there have been reports of a network of ruins on the coast of Istria, and at Kherso, locally known as Castellieri. Some antiquaries supposed them to be Roman; but Capt. Burton has found that they are built on quasi-Cyclopean foundations, and are full of weapons and stone axes, all belonging to what has been termed the Neolithic age. The late Prof. Kandler considered these remains to be Celtic; but M. Tomaso Luciani, of Albona, first proved them to be prehistoric, a generalisation which is thoroughly corroborated by the facts discovered by Captain Burton. Drs. Carter Blake, Leitner, Messrs. Carmichael and Lewis, and the President, joined in the discussion on the paper.

LINNEAN SOCIETY (February 19).

"Systematic List of the Spiders at present known to inhabit Great Britain and Ireland," by Rev. O. P. Cambridge. "On the Bracts of Crucifers," by Dr. Masters, F.R.S. "Some Observations on the Vegetable Productions and the Rural Economy of the Province of Baghdad," by W. H. Colvill, Surgeon-Major H.M.'s Indian Forces, Baghdad. The papers announced last week were again postponed.

NUMISMATIC SOCIETY (Thursday, Feb. 19).

Three papers were read:—

1. A transcript, by Capt. Hoare, of documents relating to the first issue of copper farthings in 1672, containing minute details as to the cost. This paper is a valuable addition to Ruding's *Annals*.

2. A paper by Mr. Cochran Patrick, on some unpublished varieties of Scottish coins, too technical to be of general interest.

3. A paper by the Rev. Prof. Churchill Babington, on the Roman coins relating to Britain. In sending a list of the coins of this class contained in his own cabinet, the Professor gave a detailed review of what has as yet been written on this subject, and pointed out the important services rendered by the late Count de Salis in establishing the attribution to London of the class of coins with the exergual letters PLN. Prof. Babington maintained that the later form PLON is an expansion of PLN, and makes this attribution more than probable. A discussion on this question followed, in which the President and Mr. Evans took part, the latter calling attention to the ambiguity arising from the appearance of the same letters PLN on the contemporary coinage of Lugdunum (Lyons).

CHEMICAL SOCIETY (Thursday, Feb. 19).

MR. J. BELL, F.C.S., gave a long and somewhat fatiguing lecture on "The Detection and Estimation of Adulteration in Food and Drinks." It consisted almost entirely of descriptions of the microscopic structures of coffee, tea and pepper, and their adulterants; the characters of various kinds of starch-grains, the detection of the substances used for facing tea, and an account of the methods in use for making up exhausted leaves so that they may pass for fresh ones.

FINE ART.

The Works of James Gillray, the Caricaturist, with the History of his Life and Times. Edited by Thomas Wright, Esq., M.A., F.R.S. With over 400 Illustrations. (Chatto & Windus.)

THERE is an anecdote of the not very learned John Bunyan, who used to tramp about preaching here and there, being called up to his coach window on the high-road, by a facetious Bishop of Peterborough, who said:

"Mr. Bunyan, they tell me you are great in interpreting difficult passages of Scripture. What do you think St. Paul means when he tells Timothy to bring with him his cloak, 'and the books, but especially the parchments'?"

"My lord," said Bunyan, "Paul was a travelling preacher, Timothy a primitive bishop, and this shows us that in those good days the bishops served the travelling preachers, so Paul tells Tim to look after the baggage and bring it."

It has been always considered difficult to define caricature: the relative position of these two speakers, with the contrast suggested by Bunyan, if not a definition, is an illustration of what caricature is of the most perfect kind, as we cannot resist forming a picture of the faces of the men, one of them framed by the coach window, and the absurdity suggested is truly amusing.

At first caricatures are extravaganzas of form, generally so villanously ugly that we cannot indeed be amused. It is thus with Leonardo da Vinci's sketches, and is so to this day in Italy and Germany. The French even, who are naturally very fond of caricature, hold a good deal more than we in England like to the deformed and bizarre, in their satirical prints. It is only at the present day, indeed, that we have got rid of this. Hogarth was too serious to be a good caricaturist; his "Gin Lane," and so on, are too terrible and revolting to be amusing, and with all his satiric power, no human creature, now at least, can laugh with him. Our first great master in comic grotesque invention is Gillray, and here we have, if not the most complete republication of his works, at least the most complete exposition of them. Issued from Mrs. Humphrey's shop in St. James's Street, week by week, and month by month, from about 1781 to 1809, they carry us through the whole period of the Pitt and Fox administrations and rivalries, and show us the state of feeling in this country during the French Revolution and development of the Buonaparte usurpation. During this period there were other caricaturists who have left as great a mark as Gillray, but not in the same way: Rowlandson was exactly his contemporary (one year older), and amused the general public quite as much, but he did not meddle much with politics; nor did Bunbury, one of whose designs, *The Barber's Shop at Assize Time*, was the last subject that employed poor Gillray's etching-needle, during the years of uncertain sanity preceding his death in 1815.

Since then there have been three reissues of these works. First, they appeared in selections re-engraved on a smaller size; then McLean, in 1830, got possession of the original plates, which were again transferred to Mr. H. E. Bohn, who first engaged Mr. Wright to give them his literary aid. In

the book we are now reviewing, in which the pictures are reproduced, some entire by a photolithograph process, and very perfectly, and others by being partially copied by wood-engraving and inserted in the text, we are told that "Mr. Bohn secured the co-operation of Mr. Thomas Wright, whose patient researches assist us to realise a perfect picture of our history from the accession of George I. to the downfall of Napoleon." The gentleman thus spoken of we take to be the present editor, of course, and are willing to accept the appreciatory form of speech; although we do not find the same length of time here dealt with, as the commentary begins with the prints about 1774, and ends with the mental demise of the artist about 1810. In those last done we begin to see the men of a new epoch, Cobbett and Sir Francis Burdett; the caricaturist's politics, however, remaining the same. In the "Machise Portraits," which we lately noticed, Isaac Disraeli appeared as a mild, genial old gentleman, and his son, our present Premier, as an immaculate "dandy" of twenty-five; here in Gillray's print, quizzing the experiments in the then newly-opened Royal Institution, we have Disraeli the elder as he appeared to the world in 1802, a very Israelitish profile indeed.

This plate, called *Scientific Researches*, is accompanied by another, published June 12, 1802, called *Cow-pock, or the Wonderful Effect of the New Inoculation*, showing us Dr. Jenner operating on a fair and fat countrywoman; but whether Gillray was opposed to the novelty or not, we confess we cannot make out from the horrible little cow's heads protruding from the faces and figures of those already operated on. To go into the political meanings of any of these hundreds of prints would carry us further than we can go at present, and, after all, would be of little use without reproducing the designs; but the reader will be astonished to find how great a latitude the pictorial satirist could then take even in dealing with the interior of the Royal Family. At the time of the dreaded French invasion, we find some very good pictures wherein the king, queen, and princesses appear to advantage—for instance, *The King of Brobdingnag and Gulliver*; the latter being Napoleon guiding his boat across a tank of water introduced into the drawing-room for the amusement of the company. Mr. Wright has printed, among the mass of explanatory matter he has collected, many of the ballads of the time. One of these we find attributed to Paul Sandby, "the father of water-colour painting," who was, it appears, a caricaturist as well as poet. Perhaps the reader will dispute his right to the latter honourable title after reading the verses, which, however, show us the animus of the day in England. They are called "The Corsican Pest."

"Buonaparte they say, aye, good lack-a-day,

With legions will come hither swimming,
And like a hungry shark, some night in the dark,
Will frighten our children and women.

Tol do rol.

But when these Gallie foisters gape for our oysters,
Old Neptune will rise up with glee,
Souise and pickle them quick to be sent to Old Nick,
As a treat from the God of the Sea.

Beelzebub will rejoice at a supper so nice,
And make all his devils feast hearty,
And one little *tit-bit* on a fork he will spit,
The Consular Chief Buonaparte.

And like a Lord Mayor, in his ebony chair,
While his guttlers so eager partake on't,
Crack his joke with his guest, and to give it more
zest,

Cry, Presto! and make a large Jake on't.

Then each De'il will suppose, closely stopping his
nose,

And shrinking away from the smell,
By Styx! they will roar, such an odour before,
Never entered the kingdom of Hell.

His pestiferous breath has put millions to death,
More baneful than mad dog's saliva,
More poisonous he, all kingdoms agree,
Than the dire Bohau-upas of Java.

Tol de rol."

The prints of a non-political character are not the least interesting in the book. Boydell, somehow or other, seems to have fallen under the lash of Gillray, but we confess to a total inability to make out the meaning of the print at page 111, called *Shakspeare Sacrificed*. How Boydell sacrificed Shakspeare by building the Gallery in Pall Mall, afterwards the British Institution, and expending many thousands on pictures and engravings from the plays, passes human comprehension. One of the most able is *Tom Paine's Nightly Pest*. In this, Paine dreams of punishment lying on straw, although the bed-head is ornamented with carved heads of guardian Angels, who are, in his case, Fox and Priestley, while he hugs a book inscribed *The Rights of Farthing Candles: showing their equality with the Sun and Moon, and the necessity of a Reformation of the Planetary System*. All through the series we see evidence of very great artistic powers, the drawing being often very able and even learned, not the least in the world like poor H. B., who at a later time had no pretensions to art at all. And yet Gillray sacrifices his ability, and is habitually offensive and ungainly: during his most productive years careless, also, to the last degree. We will only mention one more example, *Titianus Redivivus*. Here a row of artists, who are called *The Seven Wise Men*, are sitting painting, and above them, mounted like a goddess on a rainbow, is a queer little tattered lady—whose train, held up by the Graces, ends in a peacock's tail—employed in painting a monstrous head on a great canvas. There are many more incidents, including West, Boydell, and Macklin running away, and Sir J. Reynolds rising out of his grave. What is the meaning of all this? Mr. Wright gives no explanation here, except that the little lady is Miss Provis, but he gave more in the Bohn edition. This Miss Provis in the year 1797 persuaded all the world, including the principal artists of the time, that she had discovered the "Venetian secret;" and now this is the only record existing (Miss Provis's name even is, as far as we know, in no dictionary) of this remarkable delusion and its author. WILLIAM B. SCOTT.

EXCAVATIONS AT EPHEBUS.

MR. J. T. WOOD writes to the *Times*, under date of the 22nd ult.:—

"It may interest your readers to be informed of the results of the excavations on the site of the

great Temple of Diana during the present season, which commenced last year, in the month of October, by order of the trustees of the British Museum.

"The ground has now been cleared and thoroughly explored on all sides for about 30 feet beyond the lowest step of the platform on which the temple was raised. A considerable length of the step itself was found in position. I have, therefore, ascertained the exact length of the platform; I have also ascertained the dimensions of the temple itself with greater accuracy, having found in the part recently opened up the remains of piers connected with the foundations of the columns of the Peristyle.

"It is much to be regretted that the early Christians, who have the credit of having destroyed the temple towards the close of the third century, have so thoroughly done their work of destruction as to have left very little to illustrate its splendour in architecture and sculpture. We have been most fortunate, considering the utter destruction, now most notable on the site, in having secured what we have for our national collection of antiquities, and to have added so much more to our knowledge of the Grecian Ionic style of architecture, in which the temple was built. The base, capital, and sculptured drums of columns now in the British Museum, at the end of the Elgin Gallery, may be referred to as most interesting studies for architects and sculptors: but they must be more than glanced at, especially placed as they are at present in a most trying position, the great lion of Onidus, which was a monument in itself, and not accessory only, dwarfing and rendering unappreciable by comparison (without the necessary allowances) the life-size human figures on the sculptured drums from the temple.

"The temple is found to measure 163 ft. 9½ in. by 342 ft. 6½ in.; the platform on which it was raised 239 ft. 4½ in. by 418 ft. 1½ in., measured on the lowest step. The length here given nearly accords with that given by Pliny, viz. 425 Roman feet; the ascertained width exceeds Pliny's dimension of 220 ft., which dimension must have, therefore, lost something in transcript from the original.

"The rains having been long deferred this season, and the last season having been unusually dry, I have now been enabled to continue my exploration of the whole site to a much greater depth than before. I have consequently found, in addition to the foundations already alluded to, many particulars which were wanting to make a complete plan practicable.

"An element of great beauty had almost escaped discovery—i.e. the plentiful use of gold in the decoration of the temple. One fragment was fortunately found composed of two astragals, between which a narrow slip of lead was doubled in, in the fold of which was inserted a narrow strip of gold, which formed a fillet of gold between the astragals. I presume the three sets of double astragals of the bases of the columns, one of which is in the British Museum, were all enriched with golden fillets as here described.

"The beauty of the temple was, moreover, heightened by the use of brilliant colours, remains of which are found in numerous fragments, blue, red, and yellow being readily distinguished—blue for the background of enrichments and sculpture in relief, red and yellow for the parts requiring greater prominence.

"A number of the columns are inscribed on their bases, showing that they were dedicated to Artemis by various persons or communities. The question whether the Pronaos was fenced off from the Peristyle has been decided by the discovery of some of the mortises for the iron standards.

"The foundations of the great altar in the Cella have also been further explored, and the position of the statue of the goddess has been, therefore, decided. The remains of a wide portico have been found surrounding the temple on three sides, and at a distance of seventy feet on the south side has

been recently discovered another temple or other building in the Grecian Doric style, which is now being partially explored."

THE UTRECHT PSALTER.

THE Dean of Westminster, whose theory concerning the authorship of the Athanasian Creed was opposed by the opinion expressed by Sir T. D. Hardy as to the date of the Utrecht Psalter, has edited a collection of reports to the trustees of the British Museum in support of his own views. These reports are written by Messrs. Bond & Thompson, of the MS. department of the Museum; the Rev. H. O. Coxe, of the Bodleian Library; Rev. S. S. Lewis, Librarian of Corpus Christi College; Sir Digby Wyatt, Professors Westwood and Swainson, and Mr. Dickinson. These authorities are not entirely unanimous as to the date of the Psalter, Sir D. Wyatt thinking that it is "certainly not earlier than the seventh or eighth century," while Mr. Swainson believes that the MS. "cannot be much earlier than the middle of the ninth century," and the remaining reports place it between these two extremes. Sir T. D. Hardy, it will be remembered, assigns it to the sixth century. Mr. Bond gives a careful description of the peculiarities of the volume, and compares it with a MS. written in a similar hand (*Harleian MS. 647*), which was formerly believed to belong to the second or third century, but which he sees reasons for thinking to be a later copy in which the scribe imitated the writing of an earlier MS.; and he infers that the same imitation was practised in this case.

The opinions of Sir D. Wyatt and Professor Westwood are based principally on the drawings and illuminations, while Canon Swainson discusses the version of the psalms and creeds contained in the Psalter. Three autotype fac-similes accompany the reports, showing the style of the different artists who executed the drawings. These drawings are curiously literal illustrations of the Psalms to which they refer. For instance, the first fac-simile being an illustration of the third Psalm, represents David on a bed, protected by an angel from a crowd of armed men, one of whom the angel is smiting on the cheekbone with a spear, or rather breaking his teeth, as there is no mention of the cheekbone in the Latin version of the Psalm. In another fac-simile, the confusion of those who serve graven images is portrayed by angels hurling torches from heaven at a group of people worshipping a couple of statues very like Roman gods, standing on a column. This at least seems to be the meaning of the drawing. Dean Stanley, however, states in his preface that this drawing illustrates the 95th Psalm, but it must certainly be an illustration of the passage referred to above, which is contained in the Psalm below the drawing, numbered xcvi. (xcvii. in the English Version). Again, the drawing in the last fac-simile, which the Dean says illustrates the 106th Psalm, evidently refers to cvi. in the MS. (cvii. in the English Version). The drawing represents a city, ships at sea, vines, and a man ploughing, which doubtless refer to Psalm cvii., vv. 7, 25, and 37, but have no apparent connection with Psalm cv. It is unnecessary to discuss the arguments contained in the reports at present, as Sir T. D. Hardy will shortly publish a reply to them. C. T. MARTIN.

NOTES AND NEWS.

A CORRESPONDENT of the *Levant Herald*, speaking of the recent theft of antiquities in the Troad, says:—"The Porte directed a few years ago that any person who found a treasure or any antique object of art, should receive half the value thereof on delivering it to the authorities. But instead of strictly adhering to these instructions, it has been invariably the practice of the authorities to begin by imprisoning the discoverer, with a view to elicit a confession that he had concealed a portion of what he had found. Thus the unfortun-

nate discoverer is only too glad to recover his liberty by abandoning his claim to the promised reward. It is the apprehension of such treatment which induces the peasantry to hide whatever object of value they may discover, and to destroy the traces of such a discovery in the melting-pot. Under the present system, the revenue derived from treasure-trove cannot exceed a few hundreds of pounds; whereas the loss to archaeology must be considerable. My suggestion is, that the Government should offer the full counterweight in good Turkish money, without deduction or questioning of any kind, for all antiquities in gold, silver, or copper, which shall hereafter be brought to the authorities. All inducement to have recourse to concealment and the melting-pot would thus be removed, and many valuable relics of past ages would be saved from destruction. The Government, besides, would actually be the gainer by from ten to a hundredfold of the intrinsic value of the articles which it will have purchased."

WE regret to learn that the Abbey of St. Blaise in the Black Forest has been destroyed by fire. The Abbey Church, which resembled St. Peter's at Rome in many points, and was remarkable for the fine ceiling of the chancel, the marble high altar, and the grand columns of the nave, was designed by Blondel. Some pieces of tapestry preserved in the sacristy were the handiwork of Marie Antoinette and Maria Theresia. Nothing has been saved but the bells and the shrine of the founder.

THE German Minister of Instruction has induced Dr. Ludwig Knaus, of Düsseldorf, to undertake the direction of the two studios which are to be opened next April at the Berlin Academy of Fine Arts. All who are acquainted with Dr. Knaus' labours in the cause of art, will congratulate the Imperial capital on the acquisition of his services.

AN urn containing a large number of Roman coins has been found near Milan, by some workmen who were engaged in laying the foundations of a house at Torre dei Torti. The greater number of the coins are of silver, and belong to the time of Gallienus (A.D. 260-268). Some bear the effigy of Salonina, the wife of Gallienus, who was murdered, together with him, at Milan in 268, during an insurrection of the Imperial guard.

THE *Kölnische Zeitung*, of February 7, informs its readers that there is at the present time exhibited for sale, in the shop of the jeweller Badt, at Berlin, a magnificent ring, labelled "pawmed by Archbishop Ledochowski." This sensational announcement is of course attracting considerable attention, and, whether true or false, the ring itself appears worthy of the character claimed for it as a genuine *annulus episcopalis*, sent by the Pope to the primate. It bears a splendid amethyst, the typical stone of hierarchical consecration, on which a Christ on the cross is exquisitely carved, while the hoop and settings are of gold, curiously and richly enamelled. It is offered for sale for 1,000 marks.

THE design for the monument to be erected at Düsseldorf to Cornelius is being exhibited at Munich, by Herr Dondorf, of Dresden, the successful competitor. Its artistic completeness and poetic conception are much praised, and the whole is said to be in the style of Sansovino, in regard to form and ornamentation, both of which are carried out in the purest and noblest spirit of the Renaissance. The base, which is approached by two steps, is ornamented with garlanded and intertwined genii, and has semi-lunar projections on either side, on which rest two allegorical female figures, representing Poetry with her lyre, and Religion with book and cross. The figure itself, which stands on a plinth, shows us the artist in ordinary conventional attire, the baldness of which has, however, been skilfully concealed by a mantle, which falls in broad folds from the shoulders, and leaves the breast and left hand free.

CHARLES BLANC, now that he is released from his arduous public duties, has returned to his true vocation of student and teacher of aesthetics. In the February number of the *Gazette des Beaux-Arts* we are delighted to see that he resumes his "Grammaire des Arts Décoratifs," which has been discontinued for a long time on account, it has been understood, of the stress of ministerial work. M. Blanc has now reached the fourteenth chapter of this work, and in this and the fifteenth chapter deals with the art of the toilette, a subject that unfortunately is but seldom treated from an artistic point of view. The art of the toilette, M. Blanc insists, is submitted, like all other arts, to the three invariable conditions of order, proportion, and harmony. Any violation of these conditions produces a bizarre effect; and although a "sweet neglect" may "take" the heart of an English poet, it fails to satisfy the eye of a French critic. The harmony of the toilette necessitates the consideration of its most minute particulars; and therefore the study of such accessories as shoes, gloves, fans, parasols, fringes, laces, and furs becomes of importance. All these must be treated in their relation to the general costume, for in M. Blanc's code of toilette law harmony is the ruling principle.

Many ladies will doubtless be glad to accept M. Blanc's guidance in such matters, and, by so doing, avoid what he terms an "optical scandal" in their attire: and even dressmakers will not be inclined to disregard his authority; for while insisting upon order, proportion, and harmony in dress, he does not, as an English writer on the same subject would do, abuse fashion, but, on the contrary, agrees in part with a lady friend, who remarked, *à propos* of its caprices, "Après tout la mode n'est jamais ridicule!" This is only what it becomes when carried to the extreme; but in France, "la patrie de la mode," it must be admitted that there is generally, thought not *always*, as M. Blanc asserts, "de l'esprit pour contenir l'extravagance et du goût pour la corriger."

WE have before mentioned the fact that Florence intends to celebrate the 400th anniversary of the birth of Michael Angelo, on March 6th, 1875, and have given (vol. iv. No. 79) the principal articles of the programme drawn up by the committee formed for this purpose—the most important of which, it may be remembered, was the resolution that all the documents published and unpublished relating to the artist's life and works, should be collected together in one magnificent volume, and offered to the public. The committee are evidently at work, for in the *Times* of the 6th inst. there appears a letter signed by Aurelio Gotti, which states that they "would be very grateful to the possessors of any drawings, terracottas, or other works by Michael Angelo, if they would forward a list of the same to the care of the Italian Legation, London." This is asked in furtherance of the project of forming as complete a catalogue as possible of the works of Michael Angelo, both of those remaining in Italy and those scattered abroad. English connoisseurs and collectors will no doubt respond readily to this request, but it is to be hoped that they will not only send lists of such *genuine* works as they may possess, but also refrain from including those far more numerous ones that merely pass under the name of the great master. The value of so many catalogues is destroyed by the insertion of works that are well known to be spurious.

TORCH-HOLDERS in bronze are, by order of the Préfet of the Seine, to be set up at different points in the Place du Carrousel, so that torches may be lighted there in foggy weather when the gas lights are insufficient. If this is needful in Paris, how much more in London, the city of fog! It is to be wished that our city authorities would follow such an excellent example, or take measures of some sort for extra illumination under such circumstances.

A LIFE-SIZED bronze statue has recently been placed in the Louvre, in the same room which

contains the *Captives* of Michael Angelo. It was formerly at St. Cloud, and during the siege of Paris was thrown into a fountain in a private garden of the palace, where it was found covered with mud. This statue, which is entirely nude but for a narrow belt crossing the chest, represents a young man in a standing position, leaning on his right leg, the left leg slightly bent, and the foot placed on a grotesque animal which he has just killed. The head inclines to the right, and the right arm is raised over it, and forms a kind of frame; the left hangs close to the body, and in the hand is a fragment which might be either the hilt of a sword or the middle part of a bow. It appears that some old catalogues give this statue the name of *Jason*, some that of *Perseus*. M. Charles Clément, however, in a letter to the *Débats*, suggests that it is an allegorical statue of David crushing the serpent's head; and that it is a work of Michael Angelo's first period, ordered by the Signoria of Florence for Pierre de Rohan, Maréchal de Gié, and after his disgrace presented to Robertet, Treasurer of Louis XII., who intimated that if he received the statue he should be inclined to leniency in respect of a sum of money due from the Florentines to France. This work was originally ordered in 1502; but Michael Angelo was in no hurry, and on being called to Rome to begin the paintings in the roof of the Sixtine Chapel, entrusted its completion to Benedetto da Rozzano, so that it was not till about the end of 1508 that it was sent to Robertet, who placed it in his country seat near Blois. In 1633 it passed to the Château de Villeroy, and henceforth all traces of it are lost. M. Clément's letter will no doubt attract considerable attention among art critics.

THE galleries of the Luxembourg, which have been shut for some weeks during the re-installation of the works of art that have come back from the Vienna Exhibition, are again open to the public. A certain number of new works acquired at the Salon of 1872 have also taken rank in this great gallery of the works of modern artists, and several fresh paintings by Ingres have been added to the already large number of works by this artist. There is a talk of erecting a new gallery for modern sculpture in the Luxembourg, the narrow gallery of the ground-floor at present used being insufficient for its purpose. The gardens of the palace are full of new statues, and pedestals are still being erected on which statues will be placed in the spring.

THE works at the Tuileries are progressing towards completion. The new gallery overlooking the Seine is now finished and delivered up to the Conservators of the Louvre. This magnificent gallery is a hundred mètres in length, but it is divided into three parts by two richly-decorated "salons de repos" of circular form, situated above the Pavillons "Lesdiguières" and "de la Trémouille." The plastic ornamentation of the ceiling of these salons has been executed by the sculptor, Carrier-Belleuse, who has chosen Pleasure for his subject, representing it under the form of a bacchanalian dance, on one ceiling, and Venus Amphitrite on the other. These sculptures are on a gold ground, in bas-relief, and have the tint of ivory. The gallery itself is decorated in the same style as the other galleries of the Louvre. It has not yet been determined what collections shall be placed in it, but it is thought probable that it will be the large paintings of Rubens.

AT the sale of autographs last week at the rooms of Messrs. Sotheby, Wilkinson, & Hodge, several letters from artists and musical composers were sold. The most noteworthy were a letter from Michael Angelo acknowledging the receipt of 1,600 gold ducats as part payment for the tomb of Julius II., bought for 6*l.* 10*s.*; a letter from Rubens, 15*l.* 15*s.*; a letter from Hogarth, consenting to be a member of the Academy at Augsburg, 18*l.* 10*s.*; a letter from Beethoven, 11*l.* 10*s.*; another from Mozart respecting his

betrothed wife; a prelude for the lute by Bach; and two or three other musical compositions.

We are glad to learn that the loss to art through the burning of the Pantheon is not so great as was at first feared. Sir Richard Wallace has lost a fine collection of ancient armour and a choice library, and Mr. Wynn Ellis writes to us that he had some valuable modern pictures, but neither seems to have had any paintings by the old masters stored in the building at the time of the fire.

THE International Committee for the Exhibition of Ancient Lace make a special request in their circulars that "copies of the old Italian and French books of lace patterns should be exhibited." These books are now difficult to acquire: the patterns being pricked with a pin, many of them have been destroyed, and those that remain are eagerly sought after at fabulous prices by collectors, as among the earliest examples of wood-block printing. Bibliographical works do not record the names of above seventy of these books. That of the Italian Vinciolo, a contemporary, if not one of the followers to Paris, of Queen Catherine de Medici, is one of those most widely diffused, the various editions and reprints ranging from 1587 to 1623. Next, perhaps, is the *Corona* of Cesare Vecellio, not the work, as often erroneously stated, of Titian, though by one bearing the family name of the painter. There are ten or twelve of these pattern books in the Art Library of South Kensington, but the largest collection is in the Library of the Arsenal at Paris.

ARNOLD HERMANN LOSSOW, whose friezes and separate figures on the gables of the Bavarian "Walhall," and in the "Glyptothek," have gained for him a lasting reputation, died at Munich of apoplexy, at the age of sixty-nine, on February 3. He received his training in Schwanthaler's studio, and was one of the most distinguished, if not the very best, of that great master's pupils.

MR. GEORGE HEALY, who seems to be doing for the notabilities of America what Mr. G. F. Watts has now well-nigh done for those of England, has nearly finished his portraits of Monsieur Thiers and of Mr. Washburne, the American Ambassador in Paris. Both portraits will be seen in the approaching Salon.

ON Monday week was sold at Sotheby's a dinner service consisting of some 180 pieces, purporting to be Lowestoft china, but in fact Oriental, and manufactured for a member of the Kerr-Martin family. Each piece was decorated in the centre with a figure of Britannia holding a shield, being the arms of the family; on the borders were representations of the four quarters of the globe, and delicately executed wreaths and urns. This may be mentioned as being one of the most complete services of this particular china ever brought at one time into the market. It was broken up into a number of lots; and realised fabulous prices.

"LES INUTILES" AT THE HOLBORN THEATRE.

Les Inutiles is a type of a certain class of French plays, in that it discusses many social problems very ingeniously, and ends by solving none. Or rather, it comes to definite conclusions based upon premises of its own establishing—sharing thus the all but inevitable weakness of a work of art which tries to be a work of morality. Its moral is excellent, if you agree with it beforehand. Its art is not quite lost in the perilous pursuit of a double end—a moral mission as well as an artistic. Now M. Cadol's piece is as harmless as Erckmann-Chatrian; as didactic as Dumas the younger. But M. Cadol has certainly a lighter hand than the estimable novelists who gave us *L'Histoire d'un Payaan*; and, unlike the author of *L'Homme-Femme*, he thinks that though Truth may very likely be at the bottom of a well, she is not always to be discovered at the bottom of a social sewer.

One of our contemporaries has found fault with the piece on the ground that it is milk and water—chiefly water—but it is difficult to believe that if that be the whole of his verdict, he has looked at it from the right point of view. Certainly it is not a drama of incident, any more than it is a drama of passion. The slight story which it contains is, we think, unfolded too slowly; but we should not lose sight of the fact that it aims to be a discussion if not a settlement—and is at all events the first, if not the last—of one or more social problems, or problems of the individual life; and that as much of the younger Dumas' stage work is accepted because it is a study of morbid anatomy, so this of Cadol's is accepted because it is a study of a comparatively healthy living subject. It is vivisection practised on the sane and sound. The English do not care for this sort of thing at the theatre. To them the story is all, or the fun all. But M. Cadol was writing for the light French people—who read the *Revue des Deux Mondes* twice a month—and in listening to *Les Inutiles*, this should not be forgotten.

At the same time the play is far less than that which it aims to be. Its acts close ineffectively. The second act drags very much. The briskness and general excellence of dialogue which alone can compensate for lack of incident, are chiefly in the first. What follows requires in the acting a finish and *finesse* which at the Holborn Theatre it does not receive. There is a pretty love-scene in which Madame Tholer's action is very quiet and graceful, and Monsieur Dalbert's very impulsive and ardent; and there are several good opportunities for effective declamation, which M. Dalbert would turn to better account if he husbanded his resources more carefully. As it is, he expends his force in expressing the comparatively slight emotion of the earlier acts, and finds himself unable to give stronger colour when strongest colour is needed. He acts with intelligence and spirit; but on the whole a little too restlessly. And that is a fault which in truth some of his fellows share. There is a middle course between the immobility of bad English acting, and the too constant movement of indifferent French. People engaged in even animated conversation do not try all the seats in the room in their turn; nor does a lady often walk into a drawing-room at a cheerful trot which threatens to break into a canter. But this is all *par parenthèse*—let us return to the play.

Almost its whole story is that of a young man of ancient family and large means, who, having invested his property in the concerns of his sister's husband—a manufacturer at Amiens—is ruined in purse by his relative's failure; but, from having been one of the foremost in the class of "the Useless," becomes, at the play's end, devoted to Work: and this not so much through the accident of failure, as through the love of a young woman with a virginal soul and a snug property. The soul, which has redeemed him, he keeps for his own advantage; and the property, since he himself is ruined, is made over to the young woman's guardian—no other than the worthy manufacturer whose trade-misfortunes have relieved Paul of the burden of wealth. And the contrast most to be noted is between the tone of the young man in the first act and his tone in the second. First he is surrounded by *viveurs* who, at ten in the morning, are playing at *l'amusquet*; and by one friend who is tired of amusement, and who seeks some more fruitful life. But he himself is the apologist for Pleasure; any other pursuit seems absurd to him. He will not look forward with any apprehension to the later days of a bachelor of Pleasure, and he laughs at the idea of a man marrying when "he has not even got the *rheumatism* yet." And last, we see him rapidly converted by contact with the virginal soul. He is filled with remorse for his wasted days; but, with an empty purse and a portionless bride, he looks forward cheerfully to a career of work. The author has omitted to find him a profession; but he has excellent intentions, and

when the curtain falls, we do not enquire too curiously into what happens afterwards.

Great care and some intelligence are to be found in the acting, though it is weighted with the defects we have hinted at already, and is in the main of a quality that may be seen in a good provincial theatre in France: not such as one expects, and profits by, in the better theatres of Paris. M. Perrier plays an old, fine gentleman with much presence and humour. The part of Potey—who wavers between pleasure and serious pursuits, and finally appears to have drifted to Amiens and fallen upon the second of these courses—is well represented; so is the character of the manufacturer, and that of a provincial notary—a cold but blameless person, who works as his father has worked before him, and proposes to himself, when he is exactly thirty years old, to select a damsel with an excellent nature, and "a fortune equal to his acquired position." Madame Maria Duplessy plays the manufacturer's wife—a very influential part—with ease and confidence, but without variety and without facial expression. Acting of a more accomplished order is, in truth, required to give a literary work like this its full effect, and that is probably the secret of our contemporary's complaint, which, as the reader will have seen, we do not fully share.

"THE WHITE PILGRIM" AT THE COURT THEATRE.

THE new piece at the Court Theatre is called by its anonymous authors, we believe, a "romantic play," but that is, perhaps, too modest an appellation—the piece may well enough pass for a tragedy, until we actually get one. Its production upon the London stage is a hopeful and encouraging sign: one of many signs that the last two or three years have given us, that the Theatre having lately, to some extent, succeeded in winning the attention of a cultured class, will do something to retain it. And no well-wisher of the stage can fail to be rejoiced at every additional sign of this; for the present seems a critical period for the English Theatre, and the sooner critical periods are over the better. Ten years ago the English Theatre had no pretensions to influence or interest the cultivated class. There were three or four good actors—mostly shelved by the runs of the sensation drama. There were break-neck leaps, and real water and real horses—everything real, except dramatic power. But at present there are growing up two healthy schools of dramatic composition—the schools of comedy and of poetical drama. Mr. Albery belongs to the one; Mr. Wills to the other; and Mr. W. S. Gilbert, in some sense, to both.

Aspreux-story of De la Motte Fouqué's suggested to the authors of *The White Pilgrim* the theme of their work. But in all fairness the work may be called original, since it owes no more to its source than is owed to theirs by nearly all the great imaginative pieces which the world has rightly agreed to deem original. The shaping of the story and the telling of it are the authors' own—one of the authors, we are told, is Mr. Herman Merivale the younger—and the narrative is, in brief, the following:—Harold, a young Pagan knight of Norway, loving and loved by a Christian girl Thordisa, is tempted by Sigurd, a mis-shapen man, as cynical as Diogenes but not as wise, to repeat an oath made erewhile by one of his kindred—that if within the limit of a day a Norman wanderer shall set foot on his land, he will slay him ere a month has passed. When Harold's kinsman swore that oath, a sad and white-robed figure in pilgrim-guise—the Spirit of Death—had shown herself; and now that Harold rashly vows the same, that figure,

"with gracious majesty of gait,
But footfall dumb and printless,"

is beheld again, and he who is foresworn must pay the forfeit of his life. And scarcely is the oath taken when there comes to that castle a strange Knight and his Love. Harold, afraid, is

as one struck dumb; and the wanderer can but say,

"This is cold welcome, Sir,
For a spent traveller who has wandered far."

Harold. "From what land do you come?"

Hugo. "From Normandy."

So ends the first act; and when the second begins, the month is well-nigh spent, and either Harold is to be forsworn or Hugo slain. And Harold, taken with the love of Isabelle, the wife of Hugo, is estranged from Thordisa, and is bidden by Sigurd to fulfil his oath and to indulge his passion. Thordisa beholds the love-making of the two, and calls at first for vengeance, but at last steps in to save Harold from the sword of the husband, by declaring that the words Hugo has heard, of love "through life to death," were spoken not to Isabelle, but to herself. Struck by her goodness and her constancy, Harold renews his love for her, and, to the rage of Sigurd—who will not have the young knight perjured and dying a strange death at the White Pilgrim's hand—he tells his wife to Hugo, and bids him go in safety with his wife, who listened, only through fear of harm befalling her lord, to the love of the Norwegian knight. Harold, a Christian, repenting of his wrong, waits for the White Pilgrim, who comes at the appointed time, and unveils both to him and to his Love, Thordisa, so that both die strangely.

The constructive power shown by the authors is of great account, and the language—blank verse, with occasional rhymed couplets—is in the main good and strong. It seems to owe less to the Elizabethan drama than to the *Idylls of the King*, and would, perhaps, have been better had it owed more to the *Earthly Paradise* and the *Life and Death of Jason*. The ideas are refined, yet homely; the expression of them is commonly fitting: both, perhaps, lack the power of personal and individual inspiration; and so, while coming often very near to genuine poetry, stay oftener in the region of well-fashioned verse. Here and there a commonplace phrase, which more careful revision would surely have banished, jars somewhat on the ear. "What's the matter?" asks one of the characters, quite lightly. "Contrast is always pleasing," says Isabelle, the Norman lady. But these lapses are few.

Mr. George Rignold looks the part of the Norseman, Harold, better than he acts it. Large and rugged, and of goodly presence, he is a very painter's model for a Norwegian knight. And his acting is mostly of a praiseworthy kind: impulsive, ardent, passionate, yet grave. Once we think the limit is overpassed, so that what was just now vigour becomes for a moment rant. That is in the appeal to Thordisa, early in the third act; and moreover, Mr. Rignold's delivery of blank verse is by no means all that it ought to be. Sigurd is an unthankful part, played by Mr. Hermann Vezin with great force and seeming malice. It is a little monotonous in its unbroken savageness, so that the actor has to attain by force an effect upon the audience more often attained by variety. Mr. Edgar Bruce, as Rolf—Harold's foster brother—delivers his lines with much delicacy and point. His speech is better and more thoroughly under his control than is his facial expression. Sir Hugo has small means of making himself of interest, but his representative errs somewhat on the side of stolidity. The delivery of Miss Moodie, who appears as Thordisa, is sometimes all that can be desired: it fails least where strength and energy are of most service. But in level passages it would be better were it less emphatic. The emphasis, where no great emphasis is needed, is far too marked and strong. There is a want of rest in this delivery. Gerda, an attendant, to whom Rolf tells at the opening of the play the ancient legend of Harold's ancestor, and the White Pilgrim's visitation, is acted by Miss Kate Phillips—a promising *soubrette*—who, though her intelligence is not confined to her rôle

of *soubrette*, undoubtedly does more complete justice to such a phrase as "I like to creep"—when Rolf's story is giving her just a pleasant fit of the horrors—than to phrases more removed from any association of fun. And Miss Rose Egan—the Lady Isabelle—gives us the same impression of an intelligent actress who is doing something out of her usual line; for notwithstanding a pleasant utterance and much grace of bearing and gentleness of tone, one cannot fail to notice in her execution of the part something too near a playfulness of manner and lightness of thought, as of one not aware—and the Lady Isabelle, in her fear, was aware—of the serious issues at stake. But on the whole the interpretation of the piece is a creditable one for actors not trained in any high school, and the piece itself is undoubtedly superior in intention and in workmanship to the average of contemporary production.

FREDERICK WEDMORE.

Much Ado About Nothing was performed at the Olympic Theatre on Monday evening, and will continue to be played until the production of Mr. Tom Taylor's new historical drama, which we announced some weeks ago. Perhaps at no London theatre could the unaided resources of a single company furnish a better performance of *Much Ado About Nothing* than that which may be seen at the Olympic; but, in these days of scattered power, to say that, is a very different thing from saying that the Olympic rendering is an adequate one. Miss Emily Fowler is the Beatrice, Mr. Henry Neville the Benedick, and Miss Marion Terry the Hero; while useful aid is rendered in other parts by Messrs. Righton, Anson, Charles Neville, and others. Those of us who have read Shakspeare lazily, or who have not formed very exalted ideas of what his characters are like, or who are young enough—and middle-aged people may be young enough—not to remember the days of any great complete Shaksperian performance, may enjoy themselves very well for an evening at the Olympic, where a good many clever people are doing their best, and doing it, to say the truth, on the whole with pleasant effect. The appointments are somewhat brilliant, and some of the dresses fine: that of Beatrice appears especially so—and probably we have readers for whom this is a detail of a certain interest.

MR. BENJAMIN WEBSTER, almost the *doyen* of the London stage, is to have a great testimonial, and there will be a performance of the *School for Scandal* for his benefit. Lord Alfred Paget is chairman of the committee, and Mr. Andrew Halliday honorary secretary. The arrangements for the performance are all but completed. Our readers will note with pleasure that the cast for the comedy is of almost unprecedented strength, though it does not include, we are sorry to see, any member of the company whose performance for a twelvemonth, at the Vaudeville Theatre, was so generally excellent. The cast is as follows: Lady Teazle, Miss Helen Faucit; Mrs. Candour, Mrs. Stirling; Lady Sneerwell, Mrs. Mellon; Maria, Miss Bateman; Sir Peter Teazle, Mr. Phelps; Joseph Surface, Mr. Creswick; Charles Surface, Mr. Charles Mathews (if he can be spared from a Manchester engagement); Sir Oliver, Mr. Emery; Sir Benjamin Backbite, Mr. Buckstone; Careless, Mr. Montagu; Rowley, Mr. Horace Wigan; Trip, Mr. John Clarke; Crabtree, Mr. Compton; and Sir Harry, probably Mr. Santley.

Eldorado is the name of a new musical *mélange* by Mr. H. B. Farnie produced at the Strand Theatre on Thursday night, too late to allow of anything save the barest mention in our present issue.

THE great comedian, Got, has gone rather out of his line in playing the rôle of George Dandin. He has interested his audience at the Théâtre

Français, but has not quite convinced them that he is the character's best interpreter.

MESSRS. SOTHEY had a sale, on Monday, of masses of Old Playbills and Works connected with the Drama—a sale great rather in extent than in interest. In all respects the collection was notably inferior to that formed by the late Mr. T. H. Lacey, and disposed of by Messrs. Sothey about a couple of months ago. It had been formed by an old playgoer in the north of England, and abounded in records of the Hull, Beverley, and Scarborough Theatres, in days when actors as well as lawyers had their "Northern Circuit."

THE printer made us say last week, in our stage note on Scene-painting, that Mr. O'Connor, the scenic artist, possessed "manners that were a passport." We have no doubt whatever of the truth of the statement, which must have been as gratifying to Mr. O'Connor as it was to ourselves: especially as it took Criticism into a hitherto untrodden field, which, if further explored, might prove to be fertile. But, to be honest, we cannot claim the credit of having thus sought to enlarge the functions of criticism by favourable comment upon Mr. O'Connor's "manners." What we wrote, was, that the artist's "name was a passport"—and that, of course, in consequence of previous achievements.

THE WAGNER SOCIETY.

THE fourth concert of this Society for the present season, which took place yesterday week (the 13th), was not only one of the most interesting in its programme, but one of the most satisfactory as to the execution that the Society has yet given. The chorus, it is pleasant to be able to say, showed a very marked improvement; indeed, their singing throughout the evening was really excellent, while the orchestra could hardly have been better than it was. As at the preceding concert, the larger part of the music performed was by Wagner. Of the good policy of this there can be no doubt; for though a certain section of the public, especially of musicians, may be interested in the compositions of other modern writers, it is certainly the composer of *Tannhäuser* and *Lohengrin* who is at present the chief object of curiosity, and his name will fill St. James's Hall, while a perhaps equally fine and interesting selection from Liszt, Brahms, or Raff would be played to half-empty benches.

The present concert began with Gluck's overture to *Iphigenia in Aulis*; perhaps the best, certainly the best known, of that composer's overtures. In its original form it leads at once into the opening scene of the opera: the close performed on this occasion was furnished by Wagner. It consists merely of a few bars constructed on the themes of the piece, and requires no detailed notice. Bach's beautiful song "In deine Hände" from the cantata "Gottes Zeit ist die allerbeste Zeit" (which used to be such a favourite with Mendelssohn) followed, and was charmingly sung by Miss Antoinette Sterling. Next came Berlioz's characteristic overture to *Le Carnaval Romain*—a work which, if not equal to the same composer's overture to *King Lear*, performed at the Society's first concert this season, is full of piquant themes and masterly orchestration. The principal allegro is, however, too fragmentary in character and too much chopped up into short phrases, and the piece as a whole is deficient in breadth. With the exception of Liszt's brilliant "Goethe Fest Marsch," which closed the concert, the rest of the programme consisted entirely of a large selection from *Lohengrin*. When Wagner's time comes at the opera—of which sooner or later there can be little question—*Lohengrin* will almost certainly be the work selected for production. It has been already more than once promised, though not given; and while more representative of its composer, and more "taking" in the character of its music than *Tannhäuser*, it would present fewer difficulties in the way of its performance than either the *Meistersinger* or *Tristan und Isolde*. It repre-

sents what may be called the transitional period of Wagner's genius. The old forms, though not entirely abandoned, are already greatly modified; and thus, while short detached solos are still to be found which can be sung apart from their context, there is nothing resembling a "scena" to be met with in the whole work. The music here for the first time becomes largely subordinate to the drama. On the present occasion a longer selection from the work was given than at any previous concert. Without noticing in detail the whole of the nine pieces performed, a word of mention must be made of two fragments which had not been previously heard here. These were "Elsa's Dream" from the first act, capitolly given by Madame Elena Corani, and the wonderfully impressive scene from the same act of Lohengrin's arrival, in which Mr. Bernard Lane gave an excellent rendering of the solo part, while the chorus was thoroughly satisfactory. The effect created by this movement was such that an enthusiastic encore was the result; and one could not but think, if such music as this, which suffers more than almost any other by separation from the stage, produces so great an effect in the concert-room, *à fortiori* how striking it would be when surrounded by all suitable accessories! Moreover, in judging of the work it must not be forgotten that though the fragments brought forward happen to be the most suitable for concert use, it is not to be imagined that all the rest is inferior. The directors of the Wagner Society have not "picked all the plums out of the pudding." Many scenes might be named which have not been, and are not likely to be heard at St. James's Hall, which, from a merely musical point of view, are quite equal to what have been given there; and Mr. Dannreuther and those associated with him are doing a good work in keeping alive public interest in this music, and in whetting the appetite of our audiences for a performance of the whole work, which it is to be hoped may ere long be given. Should the execution be worthy, there can be little doubt of the result.

At the next concert, besides selections from *Rienzi*, *Tannhäuser*, *Lohengrin*, and *Die Meistersinger*, Beethoven's Choral Fantasia will be produced, with Mr. Walter Bache as pianist.

CRYSTAL PALACE—HERR JOACHIM.

THE special feature of last Saturday's concert at the Crystal Palace was the first appearance this season of Herr Joachim. This great artist has been so long acknowledged as the first of living violinists, that it is all but impossible to write anything new about him: and one is at the same time met by the difficulty that his performances are invariably so absolutely perfect that the mere description of them sounds like extravagant eulogy. The critic has simply to lay down his pen and admire. While, considered merely as a virtuoso, Joachim has few equals, the last thing one thinks of in hearing him is his wonderful mastery of the instrument. No idea of mere display or the overcoming of mechanical difficulties is suggested by his performance; and the reason of this is simply that, probably more than any other living performer on his instrument, he enters heart and soul into the spirit of whatever he plays. As Beethoven said, "That which is to go to the heart must come from the heart;" and with Joachim everything comes warm from the heart. It is not merely intellectual playing, though that is not to be disparaged; but it is the combination of a perfect understanding of the music and a complete sympathy with it which constitutes the great charm. He seems, if the phrase may be allowed, to have assimilated whatever he performs, and he reproduces it as if it were the spontaneous production of his own soul. Hence, whether in a sonata of Bach, a concerto of Beethoven or Spohr, or a quartett of Schubert or Schumann, the same feeling is produced of perfection, of absolute satisfaction. It is not Joachim's "reading" of the work; it is rather the work itself. The player seeks to bring forward, not himself, but the com-

poser; and by his very self-denial takes the highest possible artistic position. To those who have never heard Joachim, this language may perhaps seem exaggerated; but those who have had that good fortune will heartily endorse every word.

The concert on Saturday showed that the great artist had returned to us in the full possession of his powers. Indeed he seems, if possible, to play more finely every year. His performances consisted of Spohr's Concerto in E minor (No. 7) and a selection of Brahms's "Hungarian Dances," originally written as piano duets, and arranged by Joachim himself, with the concurrence of the composer, for violin and pianoforte. Spohr's concerto, though less popular than his "Scena cantante," is one of the best of the fifteen works of this class which he produced. The first and last movements are full of charm; the slow movement, though the opening subject is interesting, becomes tedious before its close. It is somewhat the fashion at the present day to decry Spohr. No doubt he has been unduly exalted; no one would rank him with Beethoven or Mozart; but on the other hand he is one of the first in the second rank of composers. True, there is a certain mannerism, a strong family likeness between all his works; but he is never commonplace or vulgar, and the workmanship of his music is always most artistically finished. His concertos for the violin rank among the best of his compositions, and some of them will probably outlive much of his other music.

Brahms's "Hungarian Dances" are distinguished by great originality and a strong national colouring. We cannot but think they are more effective in their original form; but in Joachim's adaptation they make excellent concert pieces. After what has been said above, it is needless to add a word as to the performance. It should, however, be stated that the piano accompaniments were excellently played by Mr. Franklin Taylor.

Of the remainder of the programme a few words will suffice. The symphony was Beethoven's C minor—the best-known of the nine; the other instrumental pieces being Schubert's graceful "Overture in the Italian Style," written avowedly in imitation of the overture to *Tancredi*, and the now well-known and popular *Tannhäuser* overture. The vocalists were Madame Elena Corani, and Signor Agnesi. Mr. Manns being prevented by domestic affliction from occupying his usual post at the conductor's desk, his place was most efficiently filled by Mr. Wedemeyer, the leader of the first violins.

To-day, in addition to Mendelssohn's music to the *Midsummer Night's Dream*, a new overture by Mr. Alfred Holmes and three pieces for female voices will be produced for the first time at these concerts.

Herr Joachim's reappearance at the Monday Popular Concerts last Monday was no less of a success than that just adverted to at Sydenham. The announcement of his name was sufficient to crowd St. James's Hall to the doors; and his reception on mounting the steps of the orchestra was such as a "Monday Popular" audience reserves for its special favourites. The quartett which Herr Joachim selected for performance was Beethoven's No. 10, in E flat—no novelty at these concerts, the present being its eleventh performance, but none the less welcome on that account. After what has been said above, it is needless to enlarge upon the exquisite manner in which this great work was rendered; but if one point can be selected for special mention, we should be inclined to name the deeply-moving and pathetic *adagio* (the influence of which on Mendelssohn, it may be remarked, is clearly to be traced in the slow movement of his Scotch symphony) as one of the most perfect pieces of quartett playing ever heard, both from the expressive, yet never exaggerated "singing" by Herr Joachim of the principal melodies, and from the admirable way in which he was supported by Messrs. Ries, Zerbini, and

Piatti. An even greater effect was produced later in the evening by Herr Joachim's playing of Bach's sonata for violin solo in G minor. Owing to the enormous mechanical difficulties to be found in Bach's violin sonatas, they are very seldom heard in public; and it may safely be said that no living player can give such a reading of them as Joachim. His performance last Monday was one of the most marvellous exhibitions of technical skill, combined with intellectual appreciation of the spirit of the music, which even he has ever given. The clearness with which the elaborate combinations of the fugue were brought out, and the unerring certainty of execution of the final *presto* (taken at a tremendous pace), can hardly be imagined by those who were not present. The audience recalled the performer with enthusiasm at the close of the piece, nor would they be satisfied until Herr Joachim repeated the last movement.

The pianist at this concert was that sterling artist, Miss Agnes Zimmermann, who chose for her solo Schubert's sonata in A, Op. 120—a work comparatively but little known, but one of its author's most individual, though by no means one of his greatest creations. Miss Zimmermann's reading was not only faultlessly accurate, but full of taste and feeling. No less successful was she in Beethoven's Trio in C minor, in which she was joined by Herr Joachim and Signor Piatti. A more satisfactory performance could not have been wished.

The vocalist of the evening was Mdle. Victoria Bunsen, a lady with an excellent contralto voice, who took the place of Mdle. Nita Gaetano, who had been originally announced, but was prevented by hoarseness from appearing. Mdle. Bunsen sang extremely well, but was hardly happy in her choice of music, as her first song, Schubert's "Wanderer," is much better suited for a baritone voice than for a contralto; and her second, Mozart's "Voi che sapete," required transposition to bring it within her compass.

EBENEZER PROUT.

THE Royal Belgian Academy of Sciences, Literature, and Fine Arts has issued the following list of subjects for 1874:—1. The history of sculpture in Belgium in the seventeenth and eighteenth centuries; 2. The history and bibliography of musical typography in the Low Countries, especially in the provinces now comprised in Belgium. And for 1875: An enquiry into the origin of the Belgian School of Music; show how far the earliest masters of this school are connected with the French and English *déchanters* of the thirteenth and fourteenth centuries.

A NEW opera by H. Friedrich Marburg, of the Town Theatre of Freiburg, is to be put on the boards in the course of this month. The piece is entitled *Agnes von Hohenstaufen*, and the libretto is by Ernst Sauer, of Darmstadt.

THE *Kölnische Zeitung* is authorised to state that the Musical Commission appointed to test the quality of the Great Bell cast for the Cologne Cathedral, have declared their approval of its tones; for although a slight deviation from C was at first perceptible in the note, this defect has been entirely remedied by filing off and re-polishing a portion of the interior.

ALL our musical readers will learn with regret that Madame Clara Schumann, who was to have arrived in London this week, is prevented by illness from paying her intended visit, and that it is at least doubtful whether she will be able to come to England this season.

AT M. Gounod's concert this evening, the music to *Jeanne d'Arc*, which was so warmly received at the last concert, is to be repeated.

A PERFORMANCE of Schumann's Mass in C minor was given at Cologne, in the Pantaleonskirche, on the 2nd of February.

THE performance by the Sacred Harmonic Society of Macfarren's *St. John the Baptist*, which (as mentioned in last week's ACADEMY) was announced for next Friday evening, has been unavoidably postponed to March 20. In consequence of many members of the orchestra being engaged at Mr. Kuhe's Festival at Brighton, it was found impossible to arrange for sufficient rehearsals.

It is proposed to perform at the Crystal Palace the whole of Haydn's Twelve Grand Symphonies, known as the *Salomon Set*. The first was given last Wednesday, and it is intended to continue the series on consecutive Wednesdays.

VERDI's opera *Aida* is at present in preparation, both at Berlin and Vienna.

POSTSCRIPT.

LONDON INTERNATIONAL EXHIBITION, 1874.—Her Majesty's Commissioners will feel greatly obliged for any information as to the present possessors of pictures by the following artists:—

J. Coney, who died in 1833.
J. S. Cotman, " 1842.
A. W. Pugin, " 1832.
F. Mackenzie, " 1842.

The subjects of the pictures by these artists are for the most part architectural.

WE have to regret the loss of Dr. Quételet, whose work in the field of social statistics has been of the highest order. He was born at Ghent in 1796, became professor of mathematics there at the age of eighteen, and at Brussels five years afterwards. In 1824 he was sent by the king to complete his astronomical studies at Paris, and in two years brought back the plan of the Observatory which was erected at Brussels in 1826, and of which he was director until his death. In 1841 he was made President of the Central Commission of Statistics. He was perpetual secretary of the Académie Royale de Belgique, and a correspondent of the Institute of France. He leaves a son, M. Ernest Quételet, born 1821, who, after a short military career, entered the Observatory in 1855, and has since devoted himself to scientific pursuits, chiefly connected with magnetism.

THE *Pall Mall Gazette* prints an opinion given by the Rev. Dr. Moffat, which remarkably confirms that given by the Rev. Horace Waller in another column, that there is yet hope the great traveller may not be dead. Dr. Moffat founds his opinion on the following reasons:—That, so far, no European has seen any of the natives who witnessed Livingstone's death; that it is hardly credible that Livingstone could have reached the spot where he is said to have died; that suspicion is thrown upon the story of the death by the statement that Livingstone's supplies were exhausted, the fact being that Livingstone had stores sufficient to last him eight months; that the present story is almost a repetition of the report circulated twelve years ago about another African traveller; that at the Foreign Office the report is not yet believed.

It is stated in Oxford circles that Lord Salisbury has undertaken to draw up a scheme of University Reform. The task requires a combination of scientific attainment with unflinching courage; and both these qualities the Marquis possesses in no ordinary degree. It could not be in better hands.

THE Dean and Chapter of Christchurch have invited a limited number of architects to send in designs for the completion of Wolsey's Tower at the south-east corner of "Tom" Quadrangle.

THE *Signale* reports a terrible accident at the theatre at Ulm. Twenty petroleum lamps hanging from the ceiling, suddenly exploded during a performance. The petroleum fell on the spectators right and left, setting the dresses of the ladies instantly in a blaze. Several people were seriously injured, and one lady died within an hour.

Preparing for publication, in Four Volumes, 8vo, with Portraits from the Originals in possession of the Imperial Family, and Fac-similes of Letters of Napoleon I., Napoleon III., Queen Hortense, &c.

THE LIFE OF NAPOLEON III.

Derived from State Records, Unpublished Family Correspondence, and Personal Testimony.

By BLANCHARD JERROLD.

* * * VOL. I. will be published in March, VOL. II. in the Autumn, and VOLS. III. and IV. completing the work in the Spring of 1875.

THE ACADEMY

A WEEKLY REVIEW OF LITERATURE, SCIENCE, AND ART.

WITH the Fifth Volume the ACADEMY entered at the beginning of the present year upon a new phase of its existence. Instead of 480 pages of text a year, it now publishes, in fifty-two weekly numbers, 1040 pages, each of which will contain one-fourth more matter than the old ACADEMY page.

Three-fourths of each number of the new ACADEMY is devoted to Literature of the Imagination, Travels and Antiquities, History and Biography, and includes regular notices of the Picture Exhibitions, the Music of the Season, and the current Drama, English and French. There are periodical news-letters on literary, artistic, and scientific subjects from the chief capitals of Europe, and from America; and an adequate space is set apart for correspondence between literary men, jottings of interest, publishers' announcements, personal news, and the like. In all these matters the ACADEMY tells people of all classes who are aiming at the higher culture, what to choose and what to discard, in unmistakeable terms and with promptitude.

The remaining fourth part of the periodical is occupied with scientific matters interesting to a smaller class of readers, but divested as far as possible of all unnecessary technicalities which render them uninteresting or unintelligible to the educated as distinguished from the scientific reader. The various departments of knowledge have now become so minutely specialised, that even the scientific man can no longer hope to keep pace with discovery in all directions at once, and beyond the limits of his own peculiar study occupies to a greater or less extent the position of the educated layman or general reader. So that the wants of the small scientific class are in this respect identical, or nearly so, with those of the larger reading public. These requirements vary in different countries and at different periods, and can only be ascertained by actual experience. Our experience during the past four years has been that the scientific matter to be found in the ACADEMY has been pitched in too high a key, or at least has been presented in too technical a form to be so practically useful even to the scientific reader in this country, and at the present time, as it might without any diminution of fulness or accuracy be made. We propose then to ourselves a much more difficult task than we have hitherto attempted, viz. that of making this department of the ACADEMY useful to all, and engaging the attention and interest of all educated persons in the progress of European knowledge.

This department will embrace Natural Philosophy, Theology, and the Science of Language, especially of the English Language and Dialects, and the very important and interesting study of Comparative Philology, in connection with the Mythology, Folklore, Manners, Customs, and Institutions of the various races of Mankind.

It may be asked, why retain the name ACADEMY if the paper is to be so entirely re-organised as to form to all intents and purposes a new critical organ?

We have re-organised the paper because we think that such a critical organ as we have described is wanted. As to the retention of the name, a few words of explanation are necessary.

Very few persons have, we think, understood what was meant by calling

the old fortnightly periodical, which we now propose to supersede, the ACADEMY.

The word "Academy" suggests to most average Englishmen, in the first instance, the idea of a second-rate and pretentious private school. It is also the name of a chartered Institution in London, which has won a reputation for fairness and discrimination in hanging pictures. As the name of this periodical, it appears to have given the impression to some persons that we propose to ourselves to treat of matters exclusively interesting to schoolmasters and professors at the Universities. But in all European languages except the English an "Academy" means *a central organ of sound information and correct taste in intellectual matters*. The great French Academy founded by Richelieu has more particularly taken under its charge the maintenance of the purity of the French language. The Academies founded in the principal German Capitals, and elsewhere, in imitation of the French, have laid a greater stress upon the maintenance of correct information in matters of scientific knowledge; and the renowned Academy of France has added to itself special Academies having the same object.

Now it is in the sense in which the word is understood on the Continent, in the sense of a standard of correctness in intellectual matters, that the name was and is still applied to the ACADEMY Journal. The great national importance of concentrating the intellectual forces of a country is recognised in every country but our own; and this recognition has justified the employment of public funds for the maintenance of the Foreign Academies as public Institutions, and the partial support of their members. And the absence of such an Institution in England has had this result, that a larger amount of bad work both in literature and in science passes unchallenged in this country than in any other, standing upon the same level of civilisation.

What, then, in other countries is done for learning and science *by means of an Institution* supported at the public expense, we propose to accomplish in this country, not only for these but for all the materials of culture and refinement *by means of a periodical* subjected, after the English manner, to the economic conditions of supply and demand, viz. to keep the reader up to the mark of what is best in the world, to gibbet mercilessly what is bad, and to criticise with sympathetic fairness what falls between these two extremes.

Keeping thus always to the main stream of the best production, we shall have to point to Germany for Science, to France for Art, but to our own country for Poetry and Fiction, for the Literature of Manners and Society, for Travel and Adventure, as well as for the great philosophic ideas which are transforming the mental horizon of mankind.

But there is, we are firmly convinced, no necessary connection between setting up a standard of correctness and being unintelligible or unattractive to the average reader. It is true that much of the attractive writing in this country is deficient in accuracy, and perhaps no less true, that our own work hitherto has preferred accuracy to attractiveness. Still we believe that it is practicable to unite both these qualities in criticism; and by our elaborate organisation of departmental editing, we confidently expect that we shall be able, as we have determined, to unite them in our new issue.

Subscription for one year, including postage, 18s. 6d.; for six months, 9s. 9d.; payable in advance.

Published by WILLIAM GREIG SMITH, at the Offices, 43 Wellington Street, Strand.

SATURDAY, FEBRUARY 28, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER and not to the EDITOR.

LITERATURE.

VICTOR HUGO'S NEW NOVEL.

Quatre-Vingt-Treize. Par Victor Hugo. Paris: (Michel Lévy frères.) 3 vols.

VICTOR HUGO may repeat to-day, in a different sense, but with the same proud knowledge of his strength, his old declaration of political steadfastness: "Et s'il n'en reste qu'un je serai celui-là." He was all but alone in exile. Friend after friend died, deserted, temporised, grew tepid and limp of faith. He remained consistent, upright, and obstinate. His name became a proverb for inflexibility of purpose and principle—a target for the pellets of printed paper of frivolous journalist and cynical time-server. He was the last irreconcilable. Now he is almost alone in literature—the last Romantic—the last of that generation which he impassioned and elevated, which believed in its mission and respected its genius. He is the one artist whose hand has never penned a base or cruel word; who has, in his labour of half a century, aimed high, whatever the effort may have been, active, political or intellectual. He has remained, without intermission, not only a pure and tender moralist, not only a just and generous teacher, but a conscientious worker in literature, a careful master of style and form. The rare and rich imagination has occasionally run riot—occasionally crossed the gossamer line that separates the sublime from the ridiculous. But the errors and extravagancies have been those of superabundance. The blemishes have sprung from plethora, never from poverty; and he is the only representative of French literature who can claim such an origin for his errors. In the sterility that writhes to appear fertile, in the sickly impotence, in the morbid fever, in the chaos of warring tendencies, greeds and vanities that describe the condition of literature in France during the last decade, Victor Hugo's name stands alone as the symbol of a higher and purer state—a symbol of the young hopes, the young illusions of the century, when the innovators dreamed that the reform of society depended upon a form of art, that Utopia could be realised by three volumes of romantic verse. The grandeur of the bygone age is about this central figure; and the minor mob of modern versifiers, playwrights, novelists proficient in the small arts of plot-weaving and sensational construction, shrink and dwindle before it. There are enough, and to spare, of these latter categories in modern France. The froth of Parisian wit will not fail the coming generation; the physiological school will not be extinct while M. de Montépin enlists disciples and Dumas fils creates "a doctrine." But we can discern no upholder of the dignity and purity of art likely to

accept an infinitesimal part of the heritage of Victor Hugo. His last work, planned some ten years ago, comes to us as a protest against the *amuseurs* and the emasculators—as the echo of voices to which we have grown unused of late—the embodiment of ideas that seem new to us, and somewhat beyond the mental grasp of the generation. Its title-page is alarming; there is an epic simplicity and sobriety in the opening strain which promises a work that cannot be judged by the ordinary rules of latter-day criticism—rules made to embrace mediocrity and eccentricity at times, but quite inadequate to gauge the moral purpose or estimate the literary value of a production like *Quatre-Vingt-Treize*. And it is not as a whole that even *Quatre-Vingt-Treize* must be analysed, but rather as the first instalment of a monster series of historical pictures describing the birth of a new society, the death of an old, the long travail of the one, the hard agony of the other. We should perhaps be over-sanguine to count upon the completion of this mighty purpose. We know not whether it be as yet but an embryo in the author's brain, or whether the materials are ready to his hand and need but grouping and moulding; but this much may already be affirmed: *Quatre-Vingt-Treize* can stand by itself; its framework is complete and harmonious; none of the threads of its story are left pendent at the dramatic conclusion of the "Premier Récit," which is entitled "La Guerre Civile."

The work is not likely to become popular in England, or even to be understood by the mass of Englishmen. It is too purely artistic, too lofty in tone, and deals intimately with subjects which the majority of us like to see approached with a certain conventional deference supposed to constitute the highest characteristic of the historic muse. It would be about as availing to spread a knowledge and appreciation of George Eliot by means of the Minerva press, as to endeavour to make patent to what is called the reading public all that is true, and pure, and beautiful in *L'Homme qui Rit* and *Quatre-Vingt-Treize*. It must unfortunately be admitted that we prefer our historical romances composed after the recipe possessed exclusively in modern times by Messrs. G. P. R. James and Grant. The novel with a purpose is, as a rule, a thing of subterfuge and deception in the sight of the normal Briton. And he has discovered, or fancied he has discovered, during the last few years, that Victor Hugo preaches; that the *Misérables* enlisted his sympathies, aroused his interest under false pretences; that *Notre Dame de Paris*, under the treacherous cloak of fiction, was designed to teach him archaeology and social history. *Quatre-Vingt-Treize* will not cure him of this suspicion. He will wonder what the long analysis of the Convention has to do with the story of the three babes and the widowed mother. He will wonder why nobody is married in the third volume, and why there is not one love *imbroglio* in all the work. He will also be shocked by several of the passages devoted to the dissection of the Revolutionary policy, and that of the counter-revolution. But these hindrances to popularity admitted, it should be added that political conviction or prejudice

need not in any way come between the reader and the book. Despite its title, despite the known leaning of the author, *Quatre-Vingt-Treize* is perhaps the most impartial work that could be written on the subject by a Frenchman mixing in the actual political life of his country. The Terroristes and Maratistes are not rehabilitated; the Vendéens are not libelled. M. Hugo is too shrewd an artist to identify himself with either of the contending parties he places upon the stage. He writes as a spectator, not as a critic; and this system gives a realistic colour to the romance that was perhaps wanting in the *Misérables*. The first personage presented to the reader is a peasant woman, whose native village has been ravaged by civil war, and who is flying aimlessly from unknown foes, with two children clinging to her skirts and a third at her breast. Then there is a flash of bayonets through the branches, a tramp of feet, a noise of laughter. The famous Parisian corps of Bonnet-Rouge commanded by Santerre, the brewer, comes upon the woman as she rests for a moment. The intruders are the avant-garde of the column, commanded by a sergeant and accompanied by the vivandière. "Les vivandières se joignent volontiers aux avant-gardes. On court des dangers, mais on va voir quelque chose. La curiosité est une des formes de la bravoure féminine." The "bataillon du Bonnet-Rouge" are so many Gavroches, slightly sobered by the solemnity of their mission. They approach the woman laughingly. "Who are you, Madame?" "What are your political opinions?" She is dazed and dumb from the misery of the last few days. The fine phrases of the Paris clubs, the talk of tyrants, patriots, libticide, Goddess of Reason, Supreme Being, sound to her like threats conveyed in a foreign tongue. For in fact the Bretonne Michelle Fléchard is as foreign to Sergeant Radoub, Parisian and *beau parleur*, as difference of race, sentiment, education, and experience can make them. He enjoyed comparative freedom before the Etats-Généraux were thought of; he could criticise the Court; he had his favourite ministers; he would sing satirical ditties against the Comte d'Artois and Marie Antoinette in an undertone: he was a man, if an oppressed and discontented one—whereas from generation to generation the Fléchards have been dumb, resigned, uncomplaining beasts of burden. This is the story of the Fléchard family:—

"My father was infirm and could not work because of the beating the master—his master, our master—gave him, and very kindly, for my father had taken a rabbit, and one is sentenced to death for that. But the master pardoned him, and said: Just give him a hundred blows of the rod; and so my father was lame.—Well?—My grandfather was a Huguenot. M. the Curé sent him to the galleys.—Well?—My husband's father smuggled salt. The King had him hanged.—And what is your husband doing now?—He was fighting.—For whom?—For the King.—And whom else?—Why, for his master.—And after that?—Why, for M. le Curé."

But the children win her friends. The rough, hard-visaged vivandière La Housarde discovers they are *gentils*. Sergeant Radoub gruffly intimates that soup shall be

provided for the nursling; and, finally, the woman acquiescing passively, the children of the Vendéen serf, fallen in defence of throne, seigneur, and altar, are adopted by the regiment of Bonnet-Rouge. *Quatre-Vingt-Treize* is, in reality, nothing but the story of these three adopted children of the Republic, the picture of their passage through the sombre, pitiless civil war of the Vendée unscathed and undismayed. They are the heroes of the romance—the only lovers; and it is one of the most original characteristics of Hugo's latest conception that this one love of mother and children gives the only relief to the black background of *Quatre-Vingt-Treize*. The passion of maiden and man would have formed a commonplace episode, the old contrast of every romance writer that has drawn his primary inspiration from history. As it is, we do not miss the ordinary love intrigue. Victor Hugo touches with a tender and a practised hand all that appertains to childhood. Cosette, the child Cinderella at the well, remains far longer in our memories than Cosette, the woman dreaming of her first love. "La Petit Jeanne" is perhaps the most pathetic utterance of *L'Année Terrible*.

The battalion of Bonnet-Rouge will not keep its charge long. It is already reduced to a third of its original number, and the war in La Vendée is about to become more deadly, more vindictive than ever. Coblenz requires a general. The cry of Tinténiac prevails: "Un chef et de la poudre!" There are heroes in the king's army of peasants, but not a general. D'Elbée is a nonentity; Lesclapart is ill; Bonchamp is merciful; La Rochejacquelein is only a clever subaltern; Silz is only fit for a campaign in the open field; Cathelineau is a simple waggoner; Stofflet, a cunning gamekeeper; Charette, a butcher. The combined diplomacy of England and Coblenz has at last discovered the chief that shall supersede these partisans; and the corvette, the *Claymore*, a British vessel, manned by French sailors, having the "triple fanatisme du navire, de l'épée et du Roi," sets sail from Jersey to convey the Royalist general to the Vendée. The chief passenger wears the sheepskin of the Breton peasant, but he has, nevertheless, all the qualities required in a representative of the king; he is noble, unscrupulous, courageous, and, old frequenter of the Parc aux Cerfs though he be, sufficiently religious to retain the respect and confidence of the royalist peasantry. The corvette is wrecked, the general escapes, and lands in Brittany, whence he despatches the sailor who has saved him to rouse the clans and carry the password—"Insurgez-vous! Pas de quartier!" from manor to manor, from Chouan's camp to feudal castle. M. Hugo has multiplied the dramatic incidents in this part of his work. The Marquis de Lantenac mounts the "dune" at Granville, and sees far and wide in the belfries open to the sky the tocsins balancing furiously—then, above his head, he reads affixed to the "pierre milliaire" the proclamation of the Republicans outlawing him and setting a price upon his head. He is recognised by the beggar at his castle gates, and the beggar houses and protects the noble. Then, in the early morning, from a summit where his figure is visible,

the royalist witnesses one of those summary executions in which the atrocity of the Chouan bands was only equalled by the implacable vengeance of the republican "colonnes infernales,"—an execution that took many forms of fire, and pillage, and murder, and which concluded in an immense cry, Lantenac! Lantenac! The Marquis descends, prepared for death, and finds himself in the centre of a kneeling crowd—his partisans the Vendéens, who have just burnt a farm-house occupied by the Bleus and murdered its small garrison. The Regent's minion comes in time to complete the work: the prisoners are shot, the wounded despatched, the women murdered—and the three children discovered with the vivandière La Housarde and the peasant Michelle Fléhard, borne away to the forests by the King's bands. Tellmarch, the beggar, reappears at the conclusion of this the first part, and before the dead women in the smoking ruins of the village hears that his guest of last night is the author of the calamity.

The scene is changed to Paris. Paris in Ninety-three, Paris with the old king's blood scarcely dry on the Place de la Révolution, with the young king serving Simon in the Temple; Paris laughing, speculating, making lint, quoting Delille's bucolics and making out "listes des suspects." The scene and time wanted Victor Hugo to make them appear to us with their glories, their vanities, their vilenesses intact. Is not this a summary of the virtues and follies of the new era?—"They danced the Carmagnole, and it was not the cavalier and dame, but the citizen and citizenne." They danced in ruined cloisters with paper lamps on the altar; on the ceiling a cross bearing four candles, and tombstones under the moving feet. Men wore waistcoats *bleu de tyran*; shirt-pins *au bonnet de la liberté* made of red, white and blue stones. The Rue de Richelieu was called Rue de la Loi; the Faubourg St. Antoine was the Faubourg of Glory. On the Place de la Bastille stood a statue of Nature. At the Invalides the statues of saints and kings were surmounted with the Phrygian cap. Men played at cards on the kerbstone; and the packs were revolutionised: the kings were replaced by geniuses, the queens by liberties, the knaves by equalities, the aces by laws. And with all this was mingled a certain proud weariness of life. A man wrote to Fonquier Tinville: "Have the goodness to deliver me from life. Here is my address." And beside this picture of the stoic city, ardent in its favour and hatred, extravagant and puerile at times, but in some sort hallowed by its victories, exonerated by its sufferings, we have another of the corrupt, riotous, and senile city of the Directory. "The tragic city was replaced by the cynical. The streets of Paris have had two very distinct revolutionary aspects; one before and one after the ninth Thermidor. After the Paris of St. Just came the Paris of Tallien. Such are the continual antitheses of God: immediately after the Sinai the *courtillie* appeared. There was an access of public madness. The like had been seen eighty years before. One issues from Louis XIV. as one issues from Robespierre—with a longing to breathe again. Thence the Regency which opened the cen-

tury, and the Directory that closed it. Two saturnalia after two terrors. France escapes from the puritan cloister as from the monarchical cloister, with the gladness of a nation released." Perhaps the supreme character of the present work is that to which we are introduced in Paris—the republican priest Cimourdain. "They had forbidden him to love; he gave himself up to hating. He hated falsehood, the monarchy, the theocracy, his priest's surplice; he hated the present, and called to the future with great cries; he foresaw it, he felt it beforehand and guessed it terrible and magnificent; at the end of this lamentable human misery he saw an avenger and at the same time a liberator. He worshipped the catastrophe from afar." The austere and solitary priest has but one interest, one affection—the young republican commandant Gauvain, his present friend, his former pupil. Gauvain, the nephew of the Marquis de Lantenac, commands a *corps expéditionnaire* in the Vendée—the corps against which Lantenac's bands are pitted. And with Cimourdain, who is sent by the Comité de Salut Public to join Gauvain and direct and stiffen his arm, we return to La Vendée—"la révolte-prêtre qui a eu pour auxiliaire la forêt: les ténèbres s'entraident." Lantenac and Gauvain face each other, and around them there is the smoke of burning hamlets, the cries of the massacred instruments of republican royalty—only one thing of peace and humility moves through the confusion and obscurity of Breton forests. It is the mother, Michelle Fléhard, seeking her children with the patient unreasoning persistence of an insect. The Vendée is in arms. The hinds are at war for their poverty, their slavery, their ignorance. "On one side is the French Revolution, on the other the Breton peasant. Before those incomparable events, before that fit of anger of civilisation, before that immeasurable and unintelligible reform, place this strange and grave savage, this man with the clear eye and long hair, living on milk and chestnuts, whose being is narrowed to his thatched roof, to his hedge and his ditch; who distinguishes the neighbouring villages by the sound of their church bells; who uses water but to drink it; who wears leather figured with arabesques of silk, tattooing his garments as his Celtic ancestors tattooed their skins, respecting his master in his tormentor, speaking a dead language—giving his thoughts a tomb to live in; pricking his oxen, sharpening his scythe, reaping his black grain, kneading his buckwheat *galette*, reverencing his plough first and his grandmother afterwards, believing in the Holy Virgin and the Dame Blanche, devout at the altar and at the mystic stone upright in the centre of the *lande*; a labourer in the plain, a fisher on the coast, a poacher in the forest; loving his king, his seigneurs, his priests and his lice; standing pensive and immobile for hours on the great deserted beach, a sombre listener to the sea. And who will wonder that this blind man could not receive that light?" Five hundred thousand such men are refusing the light and striking out blindly against it in this latter portion of *Quatre-Vingt-Treize*. As it is recounted in the splendid pages before us, it appears in its true

light—as the stupid heroism of bigotry allied with the brutish barbarity of ignorance. And yet here and there the dark shadows divide, the fumes of blood and arson roll back, and leave visible the lovely, homely idyll that traverses the book—Georgette, René-Jean, and Gros Alain at play, the village mother in quest of them. The last scene of the simple and yet profoundly pathetic drama which M. Hugo has interwoven with the stirring events of the great revolutionary year, describes the discovery of the children. They have remained as hostages with the Blancs; and the Blancs have been beaten back to De Lantenac's last castle, La Tourgue. The siege has commenced, and its issue is against the defenders. The castle is in flames. Escaped by a secret passage shown to him by his faithful sailor, Halmalo, the Marquis has debouched on a plateau of rock facing the castle and illuminated by the flames. And there, fronting him, appears the mother's haggard face turned towards a window, through which she sees her three children sleeping, with the red furnace above and below. "The face was no longer that of a Michelle Fléhard, it was the Gorgon. Misery is power. The peasant woman had become one of the Eumenides. The village housewife, vulgar, ignorant, unthinking, assumed suddenly the epic proportions of despair. Great sorrows are a gigantic dilatation of the soul; this mother was all maternity; everything that sums up humanity is superhuman; and she arose there on the brink of the ravine, before those flames, before that crime, like a sepulchral power: she had the cry of the beast and the gesture of the goddess." The rest is soon told. With the mother's cries in his ears, with her face urging and menacing him, the Marquis de Lantenac forgets the king, the *raison d'état*, the pitiless policy that has been his boast, and turns back by the way he issued, and regains the castle, which two enemies are now disputing—the fire and the Revolution. He rescues the imprisoned children; and as he steps into safety again a hand is laid on his shoulder: "'Je t'arrête,' dit Cimourdain. 'Je t'approuve,' dit Lantenac." But in his turn Gauvain forgets. The old Royalist's one sublime act of devotion comes between him and a hundred burning villages, a thousand ravaged fields, the murder of prisoners and women, the betrayal of the fatherland into the hands of the foreigner, and he delivers his enemy, offering himself for judgment in his stead. The court-martial that tries him is presided over by Cimourdain—and the casting vote of the president condemns his friend, his child, to death. There is a last interview between the judge and the criminal in the condemned cell; and this is perhaps the feeblest portion of M. Hugo's work. On the eve of death, the work of one, the punishment of both, the friends converse on the rôle of the Revolution, the equality of the sexes, the Utopias of the future. And on the morrow Gauvain dies on the scaffold of the guillotine, and Cimourdain falls by his own hand in the market-place.

It will easily be seen that this is no idle romance, no web of fancy woven for a day's delight. Its purpose is high and patent,

and it is served by deep and novel researches into the history of the Revolution and the chronicles of the Vendée—apart from the artistic force and fervour that M. Hugo seems to have at command as ready and perfect as when *Hernani* was produced. It is the last brief penned in defence of weakness, humility, and obscurity: the chain that began at the *Roi s'amuse* may close worthily at *Quatre-Vingt-Treize*.

EVELYN JERROLD.

Dante and his Circle; with the Italian Poets preceding him. A Collection of Lyrics, edited, and translated in the original metres, by Dante Gabriel Rossetti. Revised and re-arranged Edition. (London: Ellis & White, 1874.)

WE hail with pleasure the appearance of a new and re-arranged edition of Mr. D. G. Rossetti's translations of the early Italian poets. Himself a poet of no mean order, he possesses, what rarely falls to the lot of poets, the power of adapting himself to the thoughts of others, and reproducing them in another language, in which the art of good translation mainly consists. And for this particular kind of translation he has peculiar qualifications. For whereas, on the one hand, he possesses great command of the vocabulary and rhymes of the English language, and rare skill in imparting to it a musical sound, on the other hand, his tastes and studies from the first have imbued him with the spirit of early Italian art, so that its influence is clearly apparent both in his paintings and his original poems. Nothing short of this could have enabled him to reproduce, as he has done, the character, the style, the cadence, the art, and the conceits of the original. These Italian poems are the representatives of a literature which existed under circumstances that can never recur again; we see in them, among other things, the good and bright side of chivalrous love, without its gross licentiousness—for the prevailing type of female beauty which is described in them is that which expresses purity and simplicity—just as the pictures of the early Italian artists present us with the fair side of mediæval religion, apart from its degrading superstition; and their inherent grace and beauty impart to them an interest additional to that which attaches to the *origines* of every literature. It is therefore a great and permanent service to have enabled the readers of another language to appreciate the productions of such a period, and to feel that the charm which attracts them in the translation is not an adventitious ornament, but has its counterpart in the original. Nor must we overlook the judgment displayed in the selection of these poems, and the labour expended upon it, for, though a few of them are to be found in familiar anthologies of Italian poetry, others have been rescued from the obscurity of little-known collections, and have been endowed with new life by the light that has been thrown on their aim and meaning. Our readers will probably thank us for extracting as a specimen the following translation of a sonnet of Guido Cavalcanti; anyone who consults the original will find that it is as accurate as it is graceful:—

"Who is she coming, whom all gaze upon,
Who makes the air all tremulous with light,
And at whose side is Love himself? that none
Dare speak, but each man's sighs are infinite.
Ah me! how she looks round from left to right,
Let Love discourse: I may not speak thereon.
Lady she seems of such high benison
As makes all others graceless in men's sight.
The honour which is hers cannot be said;
To whom are subject all things virtuous,
While all things beauteous own her deity.
Ne'er was the mind of man so nobly led,
Nor yet was such redemption granted us
That we should ever know her perfectly."

For a proof of Mr. Rossetti's skill in dealing with a difficult measure, we would refer the reader to his translation (p. 127) of Dante's Sestina, a form of composition which that poet introduced into Italy from the Provençal poetry, and in which Petrarch was especially successful. His power of rendering the quaint and humorous is shown by his versions of the poems of Cecco Angiolieri, whom from his effrontery, and especially from his open profession of hatred to his father, he surnames the "scamp" of Dante's Circle.

The remarks which have so far been made would apply equally well to the first edition of this work; but the form in which it has been recast is now its distinguishing feature, and calls for special notice. It is now divided into two parts—first, Dante and his Circle; secondly, Poets chiefly before Dante. Thus, while the second part gives us a sketch of early Italian poetry from its first rise under Ciullo of Alcamo, the first part is devoted to the great mediæval poet, and those of his contemporaries whose poems throw light upon his writings. We commence with a translation of the *Vita Nuova*—the autobiography or autopsychology of Dante's youth, as Mr. Rossetti calls it; then follow some other of Dante's sonnets and lyrics, relating to his love for Beatrice, and his intercourse with his friends; and after these again such of the poetical works of his acquaintances are introduced, as illustrate their own characters and styles, their relation to him and his art, and their dealings, either friendly or the reverse, with one another. The principal amongst these figures are Guido Cavalcanti, the friend of Dante's youth, and Cino da Pistoia, the friend of his later years; but many others, less closely connected with the poet, are also represented, and ample room is found for one like the above-named Cecco, who was his unsparing opponent. Not the least interesting composition in this part of the volume is Giotto's poem on the doctrine of voluntary poverty, which deserves a place among the writings of Dante's Circle, not only because the great painter is mentioned in the *Divine Comedy*, but because of his well-known portrait of Dante, and of the traditions which describe them as having lived on terms of great intimacy, and perhaps having studied drawing together under Cimabue. The poem itself, which is a denunciation of those who pervert the doctrine, is of value as throwing light on Giotto's character, especially when taken in connection with his great fresco at Assisi, of St. Francis wedded to Poverty. We should also notice, that when any of the pieces by different authors correspond to,

one another, as in the case of answering sonnets, they have been placed side by side by the translator. The plan which has thus been carried out, of surrounding Dante by his contemporaries, has the same effect as making him the central figure in a large group in a picture, the dignity of which is heightened, while at the same time it is brought out into more distinct reality, and seen in more varied aspects, by means of the resemblances and contrasts thus suggested. Whatever in these might otherwise be vague and shadowy, is traced in forcible outlines by the graceful biographies contained in the Introduction, for the length of which Mr. Rossetti's apologies are altogether superfluous.

H. F. TOZER.

Calendar of Letters, Despatches, and State Papers relating to the Negotiations between England and Spain, preserved in the Archives at Simancas, and elsewhere. Vol. III. Part I. Henry VIII., 1525-1526. Edited by Pascual de Gayangos. Published by the authority of the Lords Commissioners of Her Majesty's Treasury, under the direction of the Master of the Rolls. (London: Longman & Co., 1873.)

SOME years have elapsed since the second volume of this series of documents from Simancas was published, and the death of the accomplished editor has been the cause of the long delay of the publication of a third volume. Even now we have only half a volume without an index, which we foresee will require a large appendix of State papers from the collection at Vienna, opened to Don Pascual de Gayangos, though his predecessor Bergenroth had not the advantage of access to it. A few only have found their way into this First Part of the third volume, and even in this there has been a departure from the original plan, which appears to have been confined chiefly to Spanish repositories. But few comparatively as the Viennese papers are compared with the extensive collection from which they have been extracted, the bulk of this volume has swelled to above 1100 pages, though it runs over a period of only two years. They are the two eventful years which begin a few weeks before the defeat of Francis at Pavia, on the Emperor's twenty-fifth birthday, the festival of St. Matthias, February 24, 1525, and end December 31, 1526, just before Bourbon started from Milan on his march to Rome. The attitude of the different nations of Europe at the commencement of this period, may be gathered from the details of the instructions given by Margaret of Savoy, to her ambassador in England, January 28, 1525. The fear was lest the alliance of the Pope with the French king, the Venetians, Florentines, and Genoese, should act prejudicially to the Emperor's interests, and lead to Francis's occupation of Naples. To avert this the Governess of the Netherlands thought it well to exhort the King of England to stand by and assist, both with money and otherwise, his ally and nephew the Emperor. Henry's position at this moment was most important, and he intended to make the most of it, though there were better methods of doing so than those suggested by the Emperor and the

Governess of the Netherlands, who wanted to incite him to invade France by way of Picardy, so as to regain his ancient inheritance in that country. It is just that period of Wolsey's greatest influence which preceded his fall, when his policy, as might have been judged by a superficial observer, was totally changed. It has been the fashion to attribute this change of policy to the two successive defeats in his candidature for the Papal See, in 1522 and 1523, when the Emperor's interest had secured the election, first of Adrian VI., and then of Clement VII. But in reality it is a great mistake to call it a change of policy. During the whole course of his political life, Wolsey had two objects in view,—first the exaltation of England and his master Henry VIII., and then its preservation in the obedience of the Apostolic See. If he desired to succeed to the triple crown, these were the ulterior objects he had at heart; and unquestionably neither Leo X., nor Adrian, nor Clement ever exercised an influence in the affairs of Europe at all comparable to that possessed by the Cardinal of York.

It was the interest of England to preserve the balance of power in Europe; and though he was aware of the Emperor's action in the matter of the election to the Papacy, he would still have been on Charles's side if Francis had won the battle of Pavia. Wolsey never intended that the French should possess Milan, and then recover Naples, and certainly as late as January 16, 1525, i.e. six or seven weeks only before the battle of Pavia, was writing to Clerk, Bishop of Bath and Wells, the ambassador at Rome, in the Emperor's interest. This letter is alluded to in Fiddes' *Wolsey*, p. 324, but may be seen in Mr. Brewer's fourth volume. That the Cardinal was preparing for the possibility of either Francis or Charles gaining the victory, is no doubt true; but the date of the letter we have been alluding to is a complete vindication of his character from the charge, which has been so repeatedly brought by modern historians, of changing sides in order to revenge himself upon the Emperor for the loss of the Papal See. There is another letter, unfortunately somewhat mutilated, written on the same day by Wolsey to some unknown correspondent, implying great fear lest the Pope should join with Francis, and the Venetians, Florentines, &c., the result of which would be to establish the French in Milan and Naples. "I pray God," says the Cardinal, "that good resistance may be made against the French king, while we shall be treating with the ambassador that cometh now out of France. Our bargain shall be like to be the better." Nothing can be plainer than that Wolsey was intending to make all the profit that could be made for England, whichever way things might turn out, and the Emperor and his ambassador in England, Louis de Praet, suspected him accordingly. But Wolsey had as yet taken no steps which precluded Henry from writing to the Emperor, to congratulate him on his victory at Pavia. The King, it appears, had previously written; but this is a second letter which went by the same post, with another congratulatory letter from the Queen to her nephew. Whether Wolsey also wrote, does not appear. Certainly there is no such letter

calendared among the Simancas documents. And here we may notice a correction of a date which this volume supplies. Mr. Brewer had previously calendared the letter from a copy which had no date, and assigned it the conjectural date March 26. The letter is holograph, and is here dated March 31, 1525. The Pope also wrote his congratulations, professing to think that the Emperor's victory would conduce to the peace of the Christian world.

Don Pascual de Gayangos has gone back nearly two months to the beginning of the year 1525, although his predecessor had calendared the Spanish papers down to the date of the battle of Pavia; and the present volume accordingly commences with twelve very interesting letters from de Praet, which, as the editor justly observes, throw considerable light on the events and negotiations that preceded the battle. De Praet was not altogether wrong in his surmise that Wolsey was contemplating the breaking off of the engagement of the Emperor with his cousin the Princess Mary of England; but he little knew his man when he thought that Wolsey, by any amount of bribing, would be retained on the Emperor's side if it was for the interest of his master the King of England, and the preservation of the country in allegiance to the Apostolic See, to side with France. De Praet evidently thought that it was possible an arrangement might be made for Mary to marry the King of Scots, and was extremely afraid of what might be intended by the French ambassador, who, at the beginning of the year, was expected, and soon afterwards arrived, in London. And he had come to the conclusion that the Cardinal of York really wished to save the kingdom of Naples from being invaded by the French, and that if the Pope should not offer what resistance was in his power to this, "even this kingdom of England might be induced to withdraw the customary allegiance to the Roman See, a matter well worthy of his Holiness's serious consideration."

De Praet throughout the whole correspondence admits that he is unable to get at Wolsey's real sentiments; but the Cardinal had made provision in case the Imperialists should get the worst, which, however, he thought by no means likely, and wrote to the King twelve days before the battle of Pavia, to say that "your affairs be by your high wisdom in more assured and substantial train by such communications as be set forth with France apart, than others in outward places would suppose." The Imperial ambassador in England was soon afterwards recalled and sent to the French court, where the subsequent negotiations for the marriage of the Princess Mary with Francis probably amply confirmed the opinion he had formed of Wolsey's duplicity.

It is curious to see in this volume, as indeed in all the transactions of the time, how little regard was paid to any other consideration than political expediency in the contracts of marriage made by or for royal personages. Notwithstanding that the agreement between the Emperor and the Princess Mary was well known in the courts of Europe, her hand was sought by the Queen of Scotland for the young king James V.; and it was

thought not improbable that she might marry in France, where negotiations for that purpose were some months afterwards entered upon. Then, too, when the Emperor wanted more money than he was likely to get with the Princess, in order to carry on the war with Francis, he scarcely made any scruple of avowing his intention of marrying "elsewhere;" and a breve of dispensation was procured from the Pope, drawn up in such general terms as would suit the case either of Mary of England or of Isabella of Portugal, both of whom were his first cousins, allowing the marriage between him and anyone who was allied to him in any degree of consanguinity except the first. This was the breve on which the espousals took place, November 1, 1525; but as exception was taken to them as not being perhaps sufficiently explicit, another breve was afterwards issued, which mentioned *seriatim* all the complications which existed in the relations of the two parties, from which it may be discovered by anyone who will take the trouble, that the Emperor and his new Empress, who were married March 11, 1526, were connected in the second, third, and fourth degrees of consanguinity.

And in connection with this event we may notice here a most interesting letter from Poupet de la Chaux, addressed October 20, 1525, to Margaret of Savoy, the Governess of the Low Countries, from which it appears that the Emperor had actually proposed through him, when he sent him as ambassador to the court of Portugal in March of that year,—that is, just at the time he was making overtures for the Princess Mary of England to be sent to Spain for her education, in order to become his future wife,—that the Princess Mary of Portugal should be sent over in the same way for the same purpose. History has taken no notice of this, though it appears from a document in the Cotton Library analysed in Mr. Brewer's fourth volume, that the project was perfectly well known to Tunstall and the other ambassadors in Spain. The young lady was the Emperor's niece, being daughter of his eldest sister Eleanor, the third wife of Emanuel king of Portugal, and also niece of his first two wives. She afterwards died unmarried, though she had been proposed successively for the Dauphin and his brother, the Duke of Richmond, and Philip II. the Emperor's son. It was upon occasion of this embassy that Isabella's name was first mentioned to the Emperor, the present King of Portugal caring more to marry his own sister to the Emperor than his half-sister Mary, who was eighteen years younger than Isabella, hinting that her dowry would be a million ducats. This proposal was made known to the Emperor May 31, and approved of immediately, the ambassador being directed, however, to continue the negotiations for the Emperor's niece till he should hear to the contrary. On October 2, after the announcement of the English ambassador that an engagement had been come to between the English and French, he was directed to ask for Isabella, and the marriage contract was signed ten days before the letter was written.

The breves of dispensation were dated November 13, 1525, one in the most general

form possible, the other specifying the circumstances of the case most minutely; and the Emperor was empowered to use either of them as might best suit the circumstances of the time; and the explanation of the double issue is given us in a letter of the same date to the Emperor from the Duke of Sessa, saying that the Pope owned he had "done it on purpose, for fear of offending the King of England, with whom he was on good terms just now."

The two years with which this volume is concerned contain so much that is interesting as regards the foreign policy of England, that it is difficult to make any selection from among the papers. We must take it for granted that our readers are acquainted with the almost romantic story of the captivity of Francis,—his interviews with the Emperor, and the politeness of their demeanour to each other (forcibly recalling to the student's mind the repetition of the story in the late war between France and Prussia), the visit of the Duchess of Alençon to console her brother, and, if possible, negotiate peace on more easy conditions than had yet been proposed,—down to the Treaty of Madrid, Jan. 14, 1526, which released Francis from his eleven months' captivity. In the Treaty of Madrid, a summary of which is given from a French contemporary copy, we observe that the editor has both wrongly read the MS., and also made an explanation of his own calculated to mislead an unwary reader. He gives the Dauphin's name as Henry Duke of Orleans, as if the MS. had it so, and then adds that the second son was Charles Count of Angoulême; whereas the two sons who were to stand as hostages for their father's fulfilment of the treaty were Francis, the dauphin, who lived on till 1536, and Henry, who became king upon his father's death in 1547. We may also remark that there is sometimes what appears to us great carelessness in producing Latin official documents, arising partly from the difficulty of making out long and intricate sentences, and partly from the misrepresentation of contracted words. Instances of both occur in the second of the breves above alluded to; whilst in another original draft of a letter from the Emperor, which is in the handwriting of *Alphonso Valdes*, it is quite impossible that Gattinara's Latin Secretary should in any moment of carelessness have written *prohibimus, pollicemur*, or *vester collegium*; and *pullentat* must be a mere mistake of reading for *pullulat*. In a contemporary copy such mistakes might possibly have been made by a clerk; but no Latin Secretary of the period could have been guilty of them. Nearly all the Latin documents in the volume exhibit the same fault.

The proceedings which immediately follow the Treaty of Madrid are of course exceedingly interesting, but an additional interest is thrown over them by the letters in this volume because they reveal the real sentiments of the writers, which have hitherto had to be guessed at from the secondhand reports of historians who, in most instances, had not seen these documents. And here we have to chronicle an omission on the part of Don Pascual de Gayangos of an important letter, which is certainly at Vienna,

for it was printed from the original by Bradford, and which illustrates the suspicions which the Emperor entertained of the French king all the time he was using such fine language about "the King his brother," and writing to the Queen-mother of France, signing himself as "her dear son Charles." The stipulation that the two sons of Francis should be left as hostages for their father's punctual fulfilment of the Treaty of Madrid was perhaps as good a guarantee as could have been fixed upon. But the Emperor so far distrusted his rival that in writing to De Praet, Feb. 19, 1526, he charges him to be very careful to notice the persons of Francis's children, that there may be no trickery in substituting others for them, adding that the Viceroy of Naples, who is to be the instrument of setting Francis at liberty, does not know the princes by sight.

How this letter came to be omitted we do not understand. The loss is not great, because it is supplied in Mr. Brewer's volume, but the omission is the more remarkable from its being an answer to the letter of De Praet to which it alludes, and which appears in its proper place in this volume. In fact it is quite impossible to understand on what principle Don Pascual de Gayangos has selected his documents. There are not, indeed, many omissions of importance to which we can point, for we do not know what the Vienna Archives contain; but there is no imaginable reason why he should have reprinted the instructions to the Archbishop of Embrun from a printed copy when Mr. Brewer had previously produced the same document from the very same source. It contains the negotiation from the Queen-mother of France, for the marriage of the Duke of Orleans with Eleanor, daughter of the Queen of Portugal, with a view to the Duke's being nominated Duke of Milan. The size of the book is unnecessarily increased by such repetitions. But we must conclude by saying how unwillingly we find fault with a volume which we have read with so much satisfaction. In the interests of the public it is, we think, important that in future volumes of this series more care should be taken with regard to both the points to which we have drawn attention.

NICHOLAS POCOCK.

The Witch of Nemi, and other Poems. By Edward Brennan. (London: Samuel Tinsley, 1873.)

THE poem from which this volume takes its title is a mythological story, original we should think; at any rate, very originally treated. Apollo falls in love with a Vestal virgin, and is assisted by Jupiter, who detains Vesta on Olympus by the simplest of expedients:—

"When he from high Olympus stole,
Jove plighted Vesta in a nectareous bowl;
Whereon the goddess, piqued with honours vain,
Quaffed the full cup, Jove pledging her again;
And thus she quaffed until she told her love
Unblushingly for the almighty Jove."

(lines, by the way, which give an early but excellent instance of Mr. Brennan's style, language, and versification.) The result of this amour of Apollo is a son, who falls in love with an Umbrian maid. Vesta, how-

ever, who has never forgiven the original offence, disguises herself as a mortal, provokes the maiden's jealousy, and induces her to poison her lover. For this the Umbrian is punished by having her heart turned to fire, whereon the poet thus moralises :—

"Who has not seen when misery fills the soul,
The surf of disappointment scattered, roll
Upon the strand of some dark hidden peace
To bear our shackled griefs a swift release,
As they, purloined of their Satanic spell,
Sink in an abyss unfathomable?"

Without flippancy, it may be suggested that several people have probably not seen this remarkable sight; but the rest of the story may be told in the words of Mr. Brennan's argument: "He (Jove) changed the volcano (Nemi) into a lake, from whence the maiden might drink, and thus cool the fires that perpetually ravished her. Apollo, considering this act insufficient in mercy, severely rebuked his father, whereupon a strange sedition arose in Hades, and well-nigh a revolt in Heaven." Which things, whosoever will may read, related in very wondrous verse. He will see, among other things concerning Jove, how :—

"turning to his throne
He seven times smote it with his lightning rod
As thrones are struck when stricken by a god.
Anon from his empyreal head, the crown
He wore, since he was crowned heaven's king, fell
down,
From which there darted lightnings, pale and red,
That in demoniac glee played round his head."

The last line, it will be observed, is somewhat inconsistent with the crown's downfall; but this is a very minor matter, and it would take volumes to comment upon all the little peculiarities of this sort which occur in the book.

But "The Witch of Nemi" only occupies about a tenth part of the whole work, and must not detain us too long. After a few pages we come to "Strivings," some forty in number, each with its stanza, of which here is a specimen :—

"I strove then with Lust for a season,
To taste if its joyance were pure;
But the potion was mingled with anguish,
Which made my desires as a sewer."

Yet a little farther, and in "Locrinus and Eysyllt" we find the Spenserian stanza in the grip of Mr. Brennan, or perhaps, to speak more correctly, Mr. Brennan in the grip of the Spenserian stanza. For instance :—

"As oft the setting sun at evening laves
In all the splendours of its lustrous light,
So sank to rest 'neath Severn's glassy waves
Sabrina and Eysyllt to that drear night
Where death despoiling life with venom'd spite
Barthens the winged treasures of our souls (*sic*)
With blank oblivious years, that phantom spright
That flutters fearlessly in our control
Till Death quaffs all the draught and breaks the
crystal bowl."

To the last five lines we have striven in vain to attach any meaning whatsoever. As to the first, it is not clear what the sun laves, unless "laves" stands *Hibernicè* for "leaves," and that again for "takes his leave." A dozen or so of minor poems follow, and then we come to two dialogues, "Bembo and Lucrezia Borgia," and "Joseph and Amensis," the latter the longest poem in the book. Both have rather dangerous subjects, and unfortunately both are treated in a manner which, were it not supremely ridiculous, would be

very unsavoury. Both bring forcibly to mind the adage, "When ladies are willing," and amply bear out its assertion. In the former, the Duchess "blows out the light," and after that graceful and significant action the dialogue is *not* stopped. In the latter, "Amensis" explains her wishes with commendable plainness; but unfortunately, as clumsily as plainly. The imitation in both these pieces, as indeed in many others, is palpable, and serves to emphasize the failure. Mr. Brennan has read *Chastelard*, and other of its author's works, and has liked them, which is a point in his favour, for if a man writes bad verse it is a feeble satisfaction that he should like good poetry. But it was an evil day for himself and his readers when he first tried to conjure with the rod of Mr. Swinburne. "'Tis Written" is a still more offensive caricature, consisting of some pages of stuff like this :—

"Time mocked at God with his sin;
Sin from his throne mocked and fell,
And rent with its barbarous din,
Delusion, and death, and hell."

But though Mr. Brennan has thus evidently inspired himself, he has no foolish reverence for his master. "Lo-Ammi," for the utter absurdity of its expression, deserves to have some of its stanzas quoted. Here are a few :

"Their bloody berretto and banner
With impious hands they would raise,
Stamping out of our land truth and honour,
And the pride of omnipotent days."

"As a vulture o'er carrion doth flutter,
To rend it with cowardly swoops,
So ye at our Albion would utter
Black treason through innocent dupes."

"Let the leal iron-shod heel betrample
The heart of inflated design!
Make the deadly distortion a sample
For fools fed on offal of swine."

And so forth for twelve stanzas. This production being "inscribed to Citizen Algenon C. Swinburne," may be discovered with some difficulty to be a reply to the Citizen's "Appeal," on the subject of the Manchester murderers. It expresses Mr. Brennan's extreme dissatisfaction with Mr. Swinburne, with the Fenians, and with certain persons unknown who are described as "flaunting intruders," and threatened with a martyr's doom, which by the way is usually considered a reward rather than a penalty.

Mr. Swinburne being disposed of, Mr. Rossetti takes his turn, not indeed of reviling, but of caricature. Echoes of his verse may be found throughout, but "Betrayed" is an obvious and clumsy imitation of "Jenny," the likeness being close enough to extend even to the metre. The manner, however, is quite Mr. Brennan's own.

In this account we have not commented on a twentieth of the passages which we had marked in reading. It has not been noticed how Mr. Brennan delivers the remarkable prayer

"Let my loins, forsaken by love,
Their cunning forget."

How he tells us of "sorrows hiccupping from hell;" how he sings :—

"Lo now the pipings of kisses,
Liquid and strong,
Trellis and echo love's blisses,
Falling among

Flowerets with Love's favours leaven
Wafting along
Under the purple of heaven
Love's latest song."

We have but scantily exposed his astonishing misuse of language, his imperial contempt of grammar, and the sublime indifference which mingles verses of any length and accent, without regard to metre or rhythm. But the specimens produced will doubtless be enough, possibly too much for most readers. If this book were a first attempt, a much briefer notice might suffice. But it appears that it is Mr. Brennan's fourth offence; he informs us indeed with less originality than complacency, that "Since first I lisped, I have been singing;" and he has therefore an undoubted claim to have judgment given with some circumstance.

But it is possible to extract from the affliction of reading him, a certain small jewel of instruction. Here is a man who to a vehement determination to write poetry, adds some amount of poetical fancy, and occasionally a fairly poetical conception. In some of the smaller poems, such as "Years Ago," "A Song," "An Invitation," and one or two others, he has reached the level of fairly good magazine verse, or rather would have reached it but for his incredible dialect. But he appears to be more utterly destitute of critical faculty than any educated poet known to us. Moreover, and this is the real point of importance, he has, unfortunately for himself, chosen a style, or rather a combination of styles, which is of all others the worst for him. Had Mr. Brennan been content to write unambitious verse, he might, under very stringent censorship, and with the aid of a good dictionary, have done something tolerable. But he must needs tread in the footsteps of the most modern of English poets, of the school which is pretty well associated with the names of Mr. Morris, Mr. Swinburne, and Mr. Rossetti. Now the style of this school has this peculiarity, that it must be skilfully practised, or else be unbearable. This is indeed one of its very greatest merits. It is utterly intolerant of mediocrity, and unluckily Mr. Brennan at his best is mediocre. He could, perhaps, if he would, turn a pretty enough ballad to the manner of Moore, in the language of Longfellow. But as we have seen, his "lispings" by no means take this form, and the result is the astounding nonsense of which we have quoted but too much. One thing we can thank him for; he has, at least, made us feel more grateful to those who have surmounted the difficulties before which he has so lamentably failed. He has reversed, for the benefit of his readers, the moral of the banished Bolingbroke. The apprehension of the worse, in his case, gives but the greater feeling to the good.

GEORGE SAINTSBURY.

Two Years in Peru, with Exploration of its Antiquities. By Thomas J. Hutchinson, F.R.G.S., &c. &c. With Map and numerous Illustrations. 2 vols. (Sampson Low and Marston, 1873.)

MR. HUTCHINSON, Her Majesty's Consul at Callao, has long been favourably known to geographers and ethnologists as an indefatigable collector and a zealous co-operator

in whatever part of the world he has been stationed; whether on the West Coast of Africa, on the shores of the Paraná, or in the maritime valleys of Peru. The present work, which is profusely illustrated with engravings chiefly from photographs, contains much useful information, partly reprinted from the volume of Consular Reports presented to Parliament and from English newspapers published in Peru, and partly printed for the first time. We thus have a valuable account of the different railways now under construction in Peru, and especially of the magnificent undertaking which is to connect Lima with the inner provinces of the Andes; late information respecting the progress of trade at Callao and on the Cooly traffic; a narrative of the revolution of July 1872; and a well-merited tribute to the patriotism and administrative ability of Dom Manuel Pardo, the present President of Peru.

Mr. Hutchinson also contributes some additions to a more exact knowledge of the remains of that interesting civilised race which inhabited the coast valleys of Peru, before their conquest by the Yncas. He carefully examined the vast mounds and other remains in the valley of the Rimac, within the triangle formed by lines connecting Callao, Lima, and Chorillos. These *huacas* have frequently been visited and examined before, but Mr. Hutchinson furnishes us with numerous accurate measurements and illustrations, which are extremely valuable. He also made excavations near Huacho, and at Chosica, on the Oroya railroad, and collected a great number of skulls and many relics of the former inhabitants of the coast valleys.

If the above materials had completed Mr. Hutchinson's work, we should have had no hesitation in saying, without any reservation, that it was a volume of considerable merit, as containing much information of use and interest to the general reader, and some archaeological details of real value to the student of Peruvian antiquities.

But this useful portion is comprised in very much less than half the work before us. The remainder is made up of long extracts from other works, crude speculations, and depreciation of all previous writers of distinction on Peruvian history. Mr. Hutchinson appears to think that in saying that the remains in the coast valleys are not those of the Yncas, but of the former inhabitants, he has made a discovery. He is mistaken. It has always been known that, for the most part, the remains in question were those of the early inhabitants; and every writer of credit, for the last three centuries, has said so. But Mr. Hutchinson goes much further. He most positively asserts that the Yncas, though they conquered, never occupied the coast valleys at all, and that there are no remains of the Yncas whatever, in any part of the region between the base of the Andes and the shores of the Pacific. In this he is entirely wrong. He offers no proof of the correctness of his emphatic assertion. It would have been interesting to know on what principle he decides that a ruin, or a relic from a tomb, is or is not of Ynca origin. We have searched carefully through his two volumes,

but without finding a sign or vestige of any reason for his dogmatic belief. It is clear, on his own showing, that he has never seen and is unacquainted with Ynca ruins; so that he has no standard by which he can compare those on the coast, and justify his assertion. Moreover, while he has no knowledge of Ynca remains, his personal acquaintance with the coast is but slight. He speaks indeed of knowing it from Arica to San José, and declares that no Ynca remains are to be found along its whole length. But, so far as appears from his book, he has merely touched at about half-a-dozen points. He was at Arica, and at Mollendo, whence he went up in the railway to Arequipa. He landed at Pisco, and ran up by rail to Yca, and he visited Cañete. From Callao he explored the *huacas* in the valley of the Rimac, and tombs round Huacho and Chancay. He also went up the coast in a steamer, touching at Pacasmayo, Huanchaco, and Eten, and making trips into the interior. The rest of the coast, hundreds of miles in length, is unknown to him personally. His positive assertions are thus based on very limited data, so far as an examination of the coast valleys is concerned, and on no principle of comparison.

As may be supposed, Mr. Hutchinson, in going the extreme length of saying that the Yncas never occupied the coast, and that there is no vestige of their occupation in any of the coast valleys, is opposed to every author of credit who has previously written on the subject. Of these he makes short work; although he confesses that he does not possess the critical faculty, "finding it difficult to guess where imagination ends and reality begins." This difficulty does not deter him from unsparing and indiscriminate censure of the works of Garcilasso de la Vega, Prescott, Stevenson, Von Tschudi, Rivero, and others. Such terms as "tomfoolery," "rant," "stuff," "trash," "fudge," "twaddle," "braggadocio," "imposture," are considered by Mr. Hutchinson as applicable to the writings of the most learned and eminent students of Peruvian history.

It is to Prescott's *Conquest of Peru* that the epithets "twaddle" and "fudge" are applied; on the ground that he makes a trivial error about the volume of the river Rimac, and mentions the undoubted fact that Pizarro selected the site for Lima mainly on commercial grounds. The work of this historian has attained too high a position to be affected, in the smallest degree, by such an attack. It deservedly stands in the first rank as a judicious history of the Conquest. Minute topographical accuracy is not of course to be expected, and, considering the well-known affliction of the illustrious writer, it is scarcely in good taste to single out a slight mistake of that kind for microscopic criticism. Yet the correctness of Prescott's descriptions of places is most remarkable. We have noticed instances of this in many parts of Peru, but the most noteworthy example is the life-like account of Malta in his *Philip the Second*. Mr. Hutchinson is certainly no respecter of persons. He lashes out at all alike. Stevenson, Von Tschudi, Rivero, are treated worse than Prescott; and poor Mr. Bollaert gets two pages of correction, because our critical author "deems it incumbent" to

set his predecessor right, "for the public good." After this prelude we expected that some serious blunder would be exposed. Mr. Bollaert published a very useful little work on Peruvian antiquities some years ago, and Mr. Hutchinson takes him to task for having spoken of Truxillo, before that town was built, instead of referring to the site on which Truxillo was afterwards founded. Our author goes out of his way to find motes in the eyes of his neighbours. He gives no quarter; and of course he expects none. His own mistakes are so serious, and his misconceptions of the early history of Peru and of the value to be attached to ancient annals are calculated to give rise to so much error, if they remain uncontradicted, that a somewhat searching examination of the work before us becomes a duty. It is certainly for the interests of sound literature that Mr. Hutchinson's criticisms should be weighed and labelled as they deserve.

His most persistent attack is levelled at the work of the Ynca Garcilasso de la Vega, the most popular and deservedly the best-known among the old Spanish writers on Peru. The son of one of the first conquerors by an Ynca princess, Garcilasso passed the first twenty years of his life at Cuzco; and Quichua, the language of the Yncas, was his mother tongue. He then went to Spain and never returned. He became an accomplished scholar and author, and had a good knowledge of Latin, Italian, and Spanish, as well as Quichua. Late in life his thoughts were turned to the land of his maternal ancestry. He noticed the numerous errors and mistakes of Spanish writers on Peru, generally caused by their ignorance of the Quichua language, and he resolved to undertake the preparation of a commentary on the works of Spaniards which treated of his native country. He accordingly made applications to his Ynca kindred, and received very ample materials from them, while his own memory enabled him to supplement their narratives and to correct errors. The result was his *Royal Commentaries of Peru*, a book of rare merit. It is professedly a criticism on the works of Spanish writers on Peru, but it also contains traditions respecting the gradual conquests of the Yncas, invaluable details with reference to laws, manners and customs, rites and ceremonies, and much general information. Garcilasso simply gives the traditions of his people as he received them. He says, "I merely relate the historical legends that I heard from my relations, and each one may be treated as the reader pleases." He was extremely conscientious, and, if he felt any doubt, the reader was always warned. For instance, where Father Acosta had given the native name for a bear as *uturuncu*, Garcilasso believed the word to mean a jaguar, but hesitated to set his memory against the express assertion of Acosta, and left the matter in doubt. Garcilasso was, however, quite right. His remarkable precision in matters relating to topography is astonishing. There are 340 places mentioned in his work, generally in describing the marches of Ynca armies, and there is not a single instance of one being misplaced as regards the relative positions. Mr. Hutchinson complains that he only

knows of two of the places mentioned by Garcilasso as situated between Acari and Quilca. That is surely Mr. Hutchinson's fault, not Garcilasso's: the places are there, and in the order in which he enumerates them. As an author Garcilasso is careful and scrupulously accurate, and the traditions he records are most valuable to a discriminating student. Of course he occasionally falls into error, as, for instance, in his attempt to account for the name Pachacamac being given to a temple on the coast of Peru, and his information is often incomplete. But he never intentionally exaggerates or attempts to mislead; and, on the whole, he is a most valuable authority; at least, to students who can exercise discrimination as to "where imagination ends and reality begins."

Prescott, in his note on Garcilasso, attributes to him a natural bias on the side of his countrymen. We happen to know that, in after years, Mr. Prescott saw reason to modify his views on this point, and to give Garcilasso credit for more impartiality than he was inclined to do when he wrote the note. In his more mature opinion he was certainly right.

It is this high authority of whom Mr. Hutchinson speaks in the most disparaging terms, as utterly untrustworthy. His depreciatory remarks are, for the most part, vague and general; while, on the three or four occasions when he ventures upon a specific charge, he utterly fails to substantiate his point. We give one example, to which four others might be added. Garcilasso tells us that, when the valley of Huarco was conquered by the Yncas, they ordered a grand fortress to be built (that of Hervay). Mr. Hutchinson asserts that Garcilasso's words are, "the sea beat on it and injured it," and "it was left for many centuries without repair, which was the cause of its being so destroyed when I passed there in 1560." Upon this Mr. Hutchinson remarks that if the fortress in question had evidence of some centuries of decay, it could not have been built by the Yncas, who overran the country less than two centuries before the Spanish conquest. But unfortunately for Mr. Hutchinson's argument, Garcilasso never said anything of the kind. His words are, "This work deserved to be left intact, as well on account of its grandeur as for its situation, its base being washed by the sea. It was so built as to have lasted for many ages without requiring repair. When I passed it in the year '60, it yet showed what it once had been, for the deeper regret of those who gazed upon it."* Apart from historical evidence, there are ample proofs that the fortress of Hervay is unquestionably of Ynca origin, and of the latest period of Ynca architecture.

Mr. Hutchinson treats another excellent authority, Cieza de Leon, in an equally contemptuous way. Our author will credit nothing that this thoroughly trustworthy old soldier relates, because he believes in and

occasionally refers to the personal agency of the Devil and of the Saints. At this rate all Grecian and Roman history would be swept away on the ground that classical authors believed in Jupiter and Venus. Mr. Hutchinson probably believes in Divine Providence. The distrust of a materialist in his veracity, if he were to refer to such agency, would be just as sensible and logical as his disbelief in the narrative of Cieza de Leon because the old soldier shares the ordinary creed of his age and country.

But why does Mr. Hutchinson expend so much space on Garcilasso, if he does not believe a word he says? Though an indispensable authority on all matters connected with the Yncas, Garcilasso is not, and does not profess to be, the historian of the Coast Indians. Mr. Hutchinson would appear to be unacquainted with the best authorities on the questions respecting which he lays down the law so confidently. Cieza de Leon gives a valuable account of the coast valleys at the time of the Conquest, but Mr. Hutchinson will not believe him; and the few other authorities on this subject, such as Balboa, Arriaga, Carrera, and Oré, are never once alluded to in the work before us. Mr. Hutchinson, by complaining that Rivero is the only author who treats fully of the valley of Chimu, shows us that the great work on the province of Truxillo by Don Miguel Feyjoo is unknown to him.

We notice a considerable number of orthographical and other blunders, many of them more serious than that for which Mr. Bollaert is so severely taken to task. Such barbarisms as *Chimoo* and *Eeca* are most objectionable. Then we have *Fiavaya* for *Tiavaya*, *Goyanache* for *Goyeneche*, *Parivacochas* for *Parinacochas*, *Huanca* and *Velica* (as if two places) for *Huancavelica*, *Limahuana* throughout for *Lunahuana*, *Manchera* for *Mancera*, *Pezulla* for *Pezuela*, *médnas* for *medanos*, and a host of similar mistakes. A Conde de la Vega is mentioned as a Viceroy of Peru. There never was a Viceroy of that name.* The valleys of Cañete and Chincha are spoken of as the same, when they are distinct and separated by a desert. The name Cañete is said to have been given from the extensive plantations of sugarcane! The valley is really called after the Marquis of Cañete, one of the most famous of the Spanish Viceroys. It is said that the name of the river Jejepeque is derived from two Quichua words, *Jeje* (hidden) and *peque* (water). *Jeje* is not "hidden" in Quichua, and *peque* is not "water." There are no such words in that language. As regards the word Ynca, Mr. Hutchinson tells us that Garcilasso has it Inca. It is so spelt in the edition of 1742, the only one to which our author refers; but Garcilasso himself spelt it Ynca, as may be seen from his manuscripts, and this is the correct and also the most convenient form.

We have said that Mr. Hutchinson is entirely mistaken in supposing that the Yncas

never occupied the coast valleys, and that there are no Ynca remains in those valleys. The proofs to the contrary are abundant and conclusive, apart from the concurrent testimony of all the earliest writers. When Fernando Pizarro and Astete visited Pachacamac, they found the Ynca system of administration thoroughly established on the coast, and the commands of the Ynca were implicitly obeyed. The policy of removing large bodies of the conquered people of the coast into the interior, and of replacing them by loyal subjects of the Yncas, had been adopted at various points, which would have been impossible if the Yncas had not been dominant. Carrera, the highest authority on such a subject, tells us that several colonies from the valley of Chimu were forced to emigrate to the neighbourhood of Caxamarca, where they still dwelt and spoke the Chimu language in his time (1644). The people of the Nasca valley were also removed to the banks of the Apurimac, and replaced by emigrants from the mountains. These and other similar changes led to the introduction of Quichua words, and the most complete proof that the coast valleys were permanently occupied by the Yncas is furnished by the fact that, with few exceptions, all names of places are Quichua, while the original names are lost. Nasca, Pisco, Runahuanac, Chilca, Pachacamac, Rimac, are all Ynca names; and the very word Ynca, which Mr. Hutchinson, like a true Ynca, applies to the people of the coast, is Quichua. But this is not all. The fortress of Hervay, which we have minutely examined and surveyed, is quite distinct from the works of the coast people, and is strictly an Ynca edifice in every detail, of the latest period of Ynca architecture. The same is the case with the ruins at Nasca, and others at the head of the Palpa valley. In several, though not many, instances, pottery and ornaments have, within our personal knowledge, been found in tombs on the coast, which were of Cuzco patterns.

The proofs of the Ynca occupation of the coast during two or three generations previous to the Spanish conquest are thus quite conclusive. The Yncas established their own system of government, organised a series of posts and a *chasqui* road, and kept the native systems of irrigation in working order. In the Nasca valley they lengthened and multiplied the old channels. In most of the valleys the former chiefs were allowed to remain in authority. Mr. Hutchinson declares that he has never been able to find any trace of the coast road of the Yncas. This is due to his never having travelled for any distance along the coast. Such traces are few and slight, because the post-road was, for the most part, simply marked out by rows of posts, with inns or *tampus* at regular intervals. These, which were seen by Cieza de Leon, have all been destroyed. But there are vestiges of the walls which skirted the road, in several valleys.

One consequence of the Ynca occupation was that the earlier language and traditions of the coast people were almost entirely obliterated. These people were far advanced in civilisation, and the study of their history is deeply interesting. With the few exceptions above referred to, the whole of the

* "La qual asi por su edificio, como por el lugar donde estaba, que la Mar batia en ella, merescia que la dejaran vivir lo que pudiera, que segun estaba obrada, viviera por si muchos siglos, sin que la repararan. Quando yo pasé por alli el año de sesenta, todavia mostraba lo que fue, para mas lastima a los que la miraban" (I, lib. vi., capt. 29).

* A Conde de la Monclova was Viceroy of Peru from 1689 to 1706, whose surname was Portocarrero, to which he appended that of his maternal ancestors, Lasso de la Vega; but there was no title of "Vega." This Viceroy was descended from Sancha, daughter of the poet Garcilasso de la Vega, who was a second cousin of the Ynca historian.

ruins and remains that have been discovered in the coast valleys were their work, and enable us to form some opinion respecting the character and degree of their advancement. In furthering such investigations Mr. Hutchinson has done really valuable service, and we very much regret that, by his wholesale abuse of all his fellow-labourers from Garcilasso to Prescott, he should have forced us to interpose in their defence.

The more complete investigation of the history of the ancient race which once peopled the coast valleys of Peru is a subject which is well worthy of the attention of enquirers, and we should rejoice to hear that some young and energetic traveller had resolved to devote several years to a systematic collection of all the information that is still within our reach. He should not commence his labours without previous study, and a thorough knowledge should be acquired of all the early Spanish writers who treat of the coast valleys. The grammar and vocabularies of the Chimu or Mochica languages, by Carrera and Oré, should be mastered, and some knowledge of Quichua would also be essential. The traveller should then start from Tumbes and critically examine and survey every coast valley as far as Nasca or Acari, following up every river to its source in the cordillera. Such work, if done in a scholarly and comprehensive spirit, would yield rich fruit, and would throw light upon one of the most perplexing and difficult questions connected with the American races: namely, the origin, history, and true position of the mysterious civilised race of the coast valleys of Peru.

CLEMENTS R. MARKHAM.

The Poetical Works of Percy Bysshe Shelley, now first given from the Author's Original Editions, with some hitherto Inedited Pieces. 1st and 2nd Series. Edited and prefaced by the Author of *Tennysonianism*. (Chatto and Windus.)

THE first volume (or first "series") of this edition of Shelley appeared towards the beginning of 1872; the second has been published recently; a third is to be issued, and will complete the set. The prose pamphlets by Shelley, printed during his own lifetime, will be included, also the whole of the volume entitled his *Posthumous Poems*; a considerable number of minor poetical pieces—chiefly fragmentary—will, however, be omitted. The professed object is to give Shelley's work "as he first printed it, unmutated and untampered with."

We highly approve of this intention—which includes (for instance) the reproduction of the original "Laon and Cythna," instead of the substituted "Revolt of Islam;" and we should wish an edition such as this to be in the hands of all Shelley students along with, though not as superseding, some other more complete and more critical edition. The question remains, Is the present reprint a good one, according to its own standard? We cannot reply in the affirmative.

We have compared four of Shelley's original editions with the volumes now before us: "Adonais" (first ten stanzas), "The Cenci" (scene 1), "Julian and Maddalo" (first paragraph), and "The Witch of Atlas" (first twelve stanzas); and we find serious discrepancies in every instance. In "Adonais," the very first line is here miserably misprinted. It runs—

"O weep for Adonais—he is dead!"

whereas it should be—

"I weep for Adonais—he is dead!"

In "The Cenci" we observe four changes. Two of

these are probably accounted for by the statement in the editor's introduction, to the effect that some errors had slipped into Shelley's first edition, "that the later (London) edition of 1821 has enabled us silently to correct." But the other two are certainly of a different character. We give the passages as they stand in the present re-issue, italicising the words misprinted, and adding the right words in brackets—

"Any design my captious fancy makes
The picture of its wish, and *its* [it] forms none
But such as men like you would start to know,
Is as my natural food" &c.

"Yet, till I kill'd a foe,
And heard his groans, and heard *the* [his] children's
groans."

In "Julian and Maddalo" we come upon only one misprint—the colon (which should be a comma) in the following passage:—

"The hoar
And aery Alps, towards the north, appear'd :
Thro' mist, an heaven-sustaining bulwark, rear'd
Between the east and west."

In "The Witch of Atlas" a fearful blunder occurs—

"A lovely lady garmented in *white* [light]
From her own beauty;"

also a grave discrepancy—

"*Their* [these] spirits shook within them, as a flame."

Here the change is undoubtedly from wrong to right; but, according to his own standard, our present editor had no business to make it at all, and especially no business to make it unnotified. If so many and such extreme inaccuracies occur within the small range of nineteen pages, how many may we expect in the 862 pages of which the two volumes consist?

What may be meant by "some hitherto Inedited Pieces," mentioned on the title-page to the 1st Series, we know not. The only piece that we can discover at all corresponding to this designation is the first poem comprised in the "Posthumous Fragments of Margaret Nicholson;" and that poem has been authoritatively stated to be written by some one other than Shelley. On p. 38 "a number of inedited letters of Shelley" are spoken of, and thereafter printed; they had been edited before by Mr. Garnett. "Queen Mab" is bereft of its lengthy and important notes—an unaccountable omission, making the present reprint inferior to most other reprints already in the market. The notes to "Hellas" also are suppressed. In "Alastor," the reading "Of wave ruining on wave" is correctly given; but it is accompanied by the incorrect statement, "In all the posthumous editions, 'ruining' is altered to 'running.'" Not so in Messrs. Moxon's volumes of 1870 and 1871 (edited by the present writer).

The compiler of the re-issue professes to "have eschewed altogether conjectural emendations." He should have adhered to that profession. Into the "Prometheus Unbound" he has introduced two conjectural emendations totally untenable, and one of them even absurdly wrong. The "Second Faun" says in Shelley:

"But, should we stay to speak, noontide would come,
And thwart Silenus find his goats undrawn,
And grudge to sing those wise and lovely songs."

"Thwart Silenus" is simply "thwarted Silenus;" and that is identical with "crossed (in familiar phrase "cross") Silenus." But our editor cannot see this. He considers "thwart" to be "so obviously a misprint, making absolute nonsense of the line," that he substitutes "swart." Again, the "Spirit of the Hour," narrating the glorious change which has come over human-kind since the unbinding of Prometheus, says:

"The loathsome mask has fall'n, the man remains,

just, gentle, wise, but man
Passionless; no, yet free from guilt or pain,
Which were, for his will made or suffer'd them."

The punctuation here (which we copy from the original edition) is, in our opinion, wrong, and the sense thereby corrupted; but the words "no, yet free" are entirely right. The re-editor considers that reading "evidently a misprint," and substitutes "not yet free." This "*not yet free from guilt or pain*" is exactly the reverse of what Shelley wrote the "Prometheus Unbound" to show forth, and what he has been elaborately announcing in prolonged passages of verse preceding the present line, and also in the very next succeeding line. It would have been well if the editor, before discerning that a particular line of "Prometheus Unbound" is "evidently a misprint," had asked himself, or had succeeded in ascertaining, what "Prometheus Unbound" is itself all about.

We could point out other inaccuracies in the edition; but should do so with reluctance, as we heartily wish that so good a project had been executed with only that amount of error to which any and every editor is liable. "The present edition of Shelley," says the compiler, R. H. S., "is the most correct and trustworthy in text of any that has yet issued from the press." Is it so? Then *tant pis pour les autres*. W. M. ROSETTI.

MINOR LITERATURE.

Life and Conversations of Dr. Samuel Johnson (founded chiefly upon Boswell). By Alexander Main. With a Preface by George Henry Lewes. Chapman & Hall.—The intention of this book—to make Boswell's Johnson known to some of those who think Boswell himself too voluminous for a busy man to read—is so excellent that we are loth to complain of the execution, and are inclined, if the result is unsatisfactory, to blame the nature of things, not the author, who has done his best to enable people who have not read Boswell to feel as if they had. An abridgment of Boswell, like an abridgment of Richardson, necessarily gives a false idea of the original work, of which the quantity is an essential feature; but from some points of view an avowed abridgment would have been preferable to the present attempt to rewrite the Life, using Boswell only as a principal authority. Macaulay and Carlyle have given excellent sketches of Johnson posing before his biographer, but after all they are worth much less than Boswell's own full-length portrait of his hero, and Mr. Main does not improve upon Carlyle. He seems, indeed, to have misunderstood the conditions under which the somewhat impossible task he has undertaken would have had to be performed if its performance had been possible. An account in small compass of the Johnson immortalised by Boswell would have been of some use, but an account of the Johnson whom Mr. Main gathers from Boswell's Life to have been a great and good man (*man* is generally in italics and always with a capital M), is less instructive; and there is a serious want of literary tact in the comments with which the new biographer thinks it necessary to introduce or enforce every trait borrowed bodily from the work of his original. The beauty of all Johnson's conversational sentences upon men or things lies in their sublime concreteness; his sayings will often bear quoting apart from their context; but to appreciate them fully we have to know not only the subject of which he was speaking, but the special occasion of the speech—the principle he wishes to demolish, the individual he wishes to demolish for maintaining it, and the circumstances that make both together obnoxious to him on one particular evening. If Boswell repeated himself, the Doctor invented fresh ways of snubbing him; but though the Doctor never repeats himself, Mr. Main persists in reproducing the same little admiring comments and ejaculations *apropos* of incidents which, if they are to be made the subject of praise at all, can only be praised to any purpose by some one versatile enough to be differently impressed by each fresh trait of clumsy sensibility, each fresh outbreak of ponderous sagacity, in which the

most admirable point is that it is unlike all its predecessors. It is strange that any one valuing Boswell enough to wish to popularise him should not have felt that if anything could take the taste out of his immortal anecdotes, it would be to hammer each of them home with a tame generality. Mr. Main praises the *Dictionary* and the *Lives of the Poets*, to which there can be no objection; but what does he mean by saying, "Judged by our modern standards, *Rasselas* can hardly be considered a work of high art"? In the name of modern standards of criticism, which would be in a bad way if this were true, we beg leave to deny the proposition categorically. *Rasselas* is a work of high art in every way in which Mr. Main's compilation is not a work of art at all.

Johann Gottlieb Fichte's Popular Works: The Nature of the Scholar, The Vocation of Man, The Doctrine of Religion. With a Memoir by William Smith, LL.D. (Trübner, 1873.)—This is a reprint of the translation published in the "Catholic Series" nearly thirty years ago. The Memoir is based almost exclusively on the *Life and Literary Correspondence of Fichte*, published in 1830 by his son, and would hardly have suffered by the omission of some fine writing and vague moralities which have not even the merit of originality. Nevertheless, both memoir and translation may be useful to those whose only other opportunity of becoming acquainted with Fichte's character and opinions is through abridged histories of philosophy. Dr. Smith does not, indeed, do much to interpret his author, or to separate what is of permanent value in his thought from the formal expression which did little to recommend his system even to contemporaries. But his exposition is so far faithful that an actual follower would not find it obscure, while a potential one would be sufficiently interested to proceed to the study of the works. The lectures "Ueber das Wesen der Gelehrten," delivered at Erlangen in 1805, have a biographical interest beyond their admirable morality, as containing Fichte's "last words" on the subject opened in his address on "Academical Discipline" to the students of Jena, published under the title of *Die Bestimmung des Gelehrten*. Dr. Smith treats this curious, and, it must be added, characteristic, episode in Fichte's professional career rather cursorily. Immediately upon his appointment to the chair of Philosophy at the University of Jena, vacated by Reinhold in 1794, he obtained an ascendancy over the students which enabled him to remonstrate with effect against the abuses of their so-called "academic freedoms," and the secret societies or "orders" by which they were maintained. Fichte was employed to negotiate between the orders and the University authorities, the former engaging to disband if an amnesty were promised for all past offences. Their papers were delivered under the seal of secrecy to Fichte, who engaged to return them unopened if the amnesty were refused. It appears that he was invited to betray the students' confidence, and indignantly declined; but the end of the affair was a rooted belief amongst some of them that he had done so, and his windows were broken, his wife hooted in the street, and himself molested in a way so much "below the dignity" of the scholar that he left Jena in disgust. That other professors were no better treated appeared to him a reason why they should leave, not why he should stay; but the contrast between the success of his abstract discoveries and the failure of his practical attempts at reform, or rather his intolerance of anything short of absolute success in practical relations, is characteristic enough to call for notice. The works translated in this volume are well known. The English version is generally intelligible, and more often stiff than inaccurate; but translation seems to bring into stronger relief the element of quaintness in all Fichte's works, produced by the mixture of logical ingenuity of the most subtle kind with a straightforward moral earnestness so obstinate as to be sometimes intolerant.

Soldier and Patriot: the Story of George Washington. By F. M. Owen (Cassell, Petter & Galpin). This is a readable and well-written little book, on a subject upon which Americans have a right to complain that English children are taught to know too little. The author's intention was only to write a life of Washington, but the book would have been more useful, and perhaps even more entertaining, if the progress of the war and the general features of Washington's public career had been more carefully traced. Though not exactly meagre, the accounts of the campaigns do not fit together so as to bring out the story of the "soldier and patriot," as a gradual triumph of honest zeal and patience, as clearly as might have been wished. The death of André, which all biographers of Washington stumble over, is treated as perhaps the effect of a temporary hardness and bitterness following from the experience of Arnold's treachery; but this account of the matter seems unfair to the hero, or at least damagingly unheroic. A more plausible explanation of his severity is, that he wished to teach the British officers the danger of trying to tamper with subordinates in whose virtue his confidence had been so rudely shaken.

Bright Beads on a Dark Thread; or, Visits to the Haunts of Vice: Being a Narrative founded on personal Adventure amongst the Criminal Class. By Arthur Mursell. (F. E. Longley.) Mr. Mursell a few years back was a Baptist minister in Manchester, and made opportunities of going amongst the criminal classes of the city in the hope of turning some of their members from the evil of their ways. We cannot say that we admire the form in which the writer has thrown his experiences. The country of which he writes has been little explored, but a sober narrative of that which he had seen and heard in that strange land would have had far more value than a tale which includes a seduction, an elopement, an attempted murder. There is nothing to indicate the line between the missionary and the novelist. Mr. Mursell, however, writes with kindly feeling of the degraded class with whom he has to deal, and his book may serve a useful purpose, if it imparts the same Christian charity to any of those who regard our criminals rather as wild beasts to be hunted down, than as erring brothers and sisters.

Where there's a Will there's a Way; or, Science in the Cottage: An Account of the Labours of Naturalists in Humble Life. By James Cash. (Robert Hardwicke. 1873.) This is an interesting book with a somewhat unfortunate title, which may lead to its being regarded as one of the many imitations called forth by the popularity of Smiles's *Self Help*. The book, though by no means exhaustive of its subject, is really a valuable contribution to the scientific biography of Lancashire. The study of botany has always been a favourite one with the working men of the north country. It may have had its origin in the practice of collecting plants for "simples," in days when scientific medicine was not; but, apart from this, there is a charm in "botanising" even for those ignorant of the very rudiments of the science. Accordingly, we find traces of plant-collectors in humble life before the days of Linnaeus; Ray was assisted by Willisel, "an unlettered man" who rambled through the country in search of plants for his patron; Dillenius was assisted in a similar manner by Samuel Brewer, who died at Bradford, in Yorkshire, about 1742. Another of these early botanists was Thomas Harrison, whose herbarium "was purchased for a considerable sum and deposited in the Manchester Library." There is reason to believe that botany was largely studied in the county in the middle of the last century, but it is not until about 1770 that we have definite information on the subject. After that date we hear of well-organised societies at Eccles, Ashton-under-Lyne, and other places; and the difficulties of communication, &c., with which these societies

had to contend were increased early in the present century by the suspicion of the Government. Among the cottage botanists whose biographies are here given we can only mention John Dewhurst, a fustian cutter; George Caley, son of a Yorkshire horse-dealer; Edward Hobson, author of the *Museum Britannicum*, one of the founders and first president of the Banksian Society; and Richard Buxton, author of the *Manchester Botanical Guide*. Buxton advises all working men to study Nature; "the fields and woods, although the rich man's heritage, may still be the poor man's flower-garden." These men were all born in very humble circumstances; and their devotion to science and their success in the pursuit of their favourite studies, fully justify Mr. Cash in taking for his text, "Where there's a Will there's a Way."

EDITOR.

NOTES AND NEWS.

WE are authorised to deny the statement of the *Athenaeum* that Mr. Gladstone "has written to Professor Max Müller, and told him that it is his purpose to devote his attention to philology." But there is a rumour in London that Mr. Gladstone has some intention of retiring for a time from public life, and devoting himself to literature, and more particularly to the translation of classical poetry. A trip to the Holy Land is also mentioned among the diversions in which the ex-Premier contemplates indulging.

M. JULES ANDRIEU has just finished writing the articles on Alchemy and Astrology for the new edition of the *Encyclopaedia Britannica*.

AMONG the recently-acquired autographs which are exhibited in the public rooms of the department of MSS. in the British Museum, there has been lately placed the original copy of verses by Lord Byron, entitled "Stanzas to Jessy," and beginning "There is a mystic thread of life." This piece, which was one of Byron's earliest poems, was written in 1807, in the poet's twentieth year. It was sent as a contribution to *Monthly Literary Recreations*, in which it is printed (vol. iii., 1808, p. 22). Byron's letter, in which he forwarded the verses to the publisher, is exhibited along with them, and shows that they were offered with some diffidence. It is as follows:—

July 21st 1807

Sir,

I have sent according to my promise some Stanzas for "Literary Recreations" the Insertion I leave to the option of the Editors, they have never appeared before. I should wish to know, whether they are admitted, or not, & when the work will appear, as I am desirous of a Copy

&c &c

BYRON.

P.S. Send your answer when convenient.

(Addressed) Mr. Crosby
Stationer's Court.

"FEAR not, till Birnam wood Do come to Dunsinane."—A parallel to this Shaksperian prophecy, and, as he strangely enough supposes, to a stratagem of the Hebrew king Abimelech (Judges ix.), is pointed out by Dr. Egli in Hilgenfeld's theological *Zeitschrift*, 1874, No. 2. As there is no mention of it in Simrock, it may be new to most readers. The authority is Von Hammer's *History of Arabic Literature*, vol. i. p. 48. There lived in the times before Mohammed a famous Arab prophetess, called Serka, whose vision was so acute that she could discern man and horse at a distance of a day's journey. She was married to a man of the tribe of the Beni Djedis, and, it is said, warned the tribe of her husband in vain against the approaching army of the king of Yemen, Hasán ben Tobbá, the Himyarite, which was on its march, covered with boughs. "I see," exclaimed Serka, "the walking forest." The Beni Djedis thought she lied, and answered, "Who has ever seen walking trees?" But the hostile army advanced, with desolation in its course, and Serka herself was hanged, after having her eyes put out. When her people would not

believe her, she exclaimed in the following distich:—

"I swear it by God, the trees advance;
If not, it is a stratagem of the Himyarite."

Taken at the Flood, the novel contributed by Miss Braddon to the columns of some provincial newspapers, will shortly appear in the orthodox three-volume shape. The experiment of issuing an original novel in newspapers published simultaneously in different parts of the kingdom has answered expectations. Miss Braddon has undertaken to follow up the completion of *Taken at the Flood* with another novel.

THE Government of Berne is about to issue a regulation fixing the conditions on which women may be admitted to the University courses. The number of female students, principally Russians and Roumanians, on the books of the University of Berne, is at present about thirty.

A GENOISE paper, says the *Débats*, publishes the following autograph of Tasso (aged 26 in 1570) from the collection of the Marquis Villanova:—

"The undersigned acknowledges the receipt from M. Abraham Lévy of 25 livres, for which he keeps in pledge a sword of the same price, 6 shirts, 4 sheets, and 2 napkins.

"March 2, 1570. (Signed) TORQUATO TASSO."

AMONG the books burnt at the Pantechnicon fire were Mr. Halliwell's roomful of Shakspeare and other volumes; all his presentation copies to his wife of the whole series of his publications, including his folio *Shakspeare*; all the stock of his Ashbee facsimile reproductions of the series of quartos of Shakspeare's plays, &c. The books were insured only for two-thirds of their value.

MR. FLEAY's table of the quartos of Shakspeare's Plays, and his first paper for the New Shakspeare Society, with his table of the rhyming lines, alexandrines, redundant syllable lines, short lines, Latin quotations, &c., are already at press.

EFFORTS are being made to form branches of the New Shakspeare Society at Oxford, Bath, and Leeds. The director wishes much to see new centres of Shakspeare study formed all over England. Mr. N. E. S. A. Hamilton, formerly of the British Museum, has joined the Vice-Presidents of the New Shakspeare Society.

THE Master and Fellows of Trinity College, Cambridge, have granted the Early English Text Society a six months' extension of the time for the return of the College MS. of the Early English version of the *Cursor Mundi*, which Dr. Richard Morris is editing for the Early English Text Society.

We are glad to hear that Mr. Halliwell has other Shakspeare "finds" in store for us besides his four-year old one of the Globe and Blackfriars actors' petitions about their shares of profits. Among them are: 1. A mention of Shakspeare as an actor four years before the earliest previously known one in Ben Jonson's *Every Man in his Humour*, in 1598. For 1598 Mr. Halliwell can now substitute 1594. 2. He can show that the Globe Theatre, which is supposed to have been rebuilt in 1594, or early in 1595, was not in fact begun till 1599. 3. He has searches making in the Court of Wards and Liveries, &c., which are pretty sure to yield facts of importance. 4. Sir T. Duffus Hardy and Mr. Bond have, at Mr. Furnivall's request, most kindly ordered the arrangement of the Court of Request records during the reign of Charles I., so that the documents in the most important suit of Burbage v. Brand, which will probably show Shakspeare's interest in the Globe Theatre, must soon be discovered. 5. Mr. Halliwell continues his searches for actors in the Subsidy Rolls, &c.; finds Cuthbert and Richard Burbage, and their fellow-actor, Cowley, all in one street; that one year Richard Burbage cannot pay the subsidy charged on him, &c.—many interesting little details that will some day work into a complete picture of Shakspeare and his fellows.

It has been long known that Shakspeare's inventory, the list of his goods, and most probably his books, ought to be in the collection of inventories now in the Probate Office, and which was brought there from St. Paul's. Many years ago the Society of Antiquaries and their president, Lord Stanhope, appealed to the Treasury in vain to supply funds for a search for Shakspeare's inventory, and a calendar of all the documents. Later, at the instance of Mr. H. C. Coote, Mr. Furnivall printed a letter on the subject; and a fortnight ago, at Mr. Halliwell's instance, got leave from Sir James Hannen, the Judge of the Probate Court, to inspect the inventories. They are locked up in a little room in the Probate Office, and are contained in some twenty boxes, each perhaps 2 ft. long by 18 in. broad, and 18 in. high; are little rolls of parchment about 5 in. broad, varying in thickness from your little finger to your thumb, and containing from one to six strips of parchment apiece. Not one of them is labelled outside; and none are sorted according to years. You make a dive into the nearest box, and feel like looking for a needle in a bundle of hay. The only plan will be to have every inventory out, write down its date, and the name of the owner of the goods (1) on your own list, (2) on a slip of paper, then tie the slip on the inventory, and take up another; have out fifty at a time, and you'll come on Shakspeare's in due course, if no Pauline rat ate it, or rain rotted it, before the late removal of the records to their present abode took place. Now the Probate Office is so undermanned, that its current work cannot be kept under, but is five years in arrears. The Shakspeare inventory search must, therefore, be the work of volunteers after the documents are moved to Somerset House in April, or the Treasury must be appealed to for an extra grant for a competent searcher or two. But, as there must be some well-off lovers of Shakspeare who can give time for the search, we hereby give them the chance of volunteering for it. Names may be sent to Mr. Furnivall, 3 St. George's Square, Primrose Hill, N.W. A former officer of the Probate Office, Mr. Paris, who took a warm interest in such matters, did at off times calendar and number several of the inventories some years ago; but he was, unhappily for Shakspearians, moved to a better-paid post, and the work has stood still since. Who will start it again?

OUR readers will be interested to see the native part of the cast of *Richard II.* as read in public lately, with English officers and ladies, at the Rajkumar College, Rajkote: "John of Gaunt and Earl of Northumberland, Hurrisingjee of Bhowmuggur" [what would Shakspeare say to that?]; "Henry Bolingbroke, the Thakore of Limree; Earl of Aumerle and Captain of Welsh forces, the Rajah of Loonawarra; Marshal, &c., Mr. Ruti Lall; Duke of York, Mr. Turkhud; Duchess of York, Miss Turkhud; Lady attendant on the Queen, Miss A. Turkhud." Pleasant to hear of, such work as this; English and Indian men and women learning to love Shakspeare together. If this can go on all over the land, Indian social questions will soon be settled.

WE are very pleased to hear that Mr. Edward Arber, the zealous producer of the admirable series of "English Reprints," &c., has received enough promises of subscriptions to his great fresh undertaking, to justify his printing his *Transcript* [page for page] of the *Registers of the Company of Stationers of London, between 1554 and 1640 A.D.*, in four thick volumes, demy quarto, twenty guineas a copy; royal quarto (large paper), fifty guineas a copy. The book will be sold to subscribers only; and on the completion of the fourth volume, all copies not subscribed for will be destroyed. The book will be indispensable in every public and every large private library. It is the only foundation for accurate bibliography during the best periods of our literature, the Elizabethan and Stuart ones; and our only regret is that Mr. Arber has been forced—as well by his own long experience of the trade, as by the abandonment of

the proposed publication of the book by the Early English Text Society, and Mr. Rivington—to produce it at such high prices and in such small numbers. Still the appearance of the work under any conditions will be a great gain to every student of our Middle Literature. Mr. Arber's name is sufficient guarantee for the accuracy of the text, as Messrs. Childs' is for its handsome look in print. The book is at press, and will be completed within two years. It will contain about 3,000 pages and 21,000 entries, besides autographs, indexes, &c.

THE first part of the Ballad Society's publications, Mr. F. J. Furnivall's *Ballads from MSS.*, vol. i., part 1, *Ballads on the Condition of England in Henry VIII.'s and Edward VI.'s Reign (including the State of the Clergy, Monks, and Friars)*, has run out of print. The Society will shortly reprint the part, which contains the ballads of "Now-a-Dayes," about 1520 A.D.; "Vox Populi Vox Dei," A.D. 1547-8; "The Ruyn of a Ream," ? before 1520; "The Image of Ypocresye," A.D. 1533; "Against the Blaspheming Lutherans and the Poisonous Dragon Luther;" "The Spoiling of the Abbeyes;" "The Overthrowe of the Abbyes, a Tale of Robin Hood;" and "De Monasteriis Dirutis," with long introductions on the state of the times, and extracts from contemporary documents, and an historical view of the morals of the clergy. Mr. William Chappell will this year complete the second volume of his edition of the *Roxburghe Ballads*, for the Ballad Society.

THE Chaucer Society will send out at once a sheet of additions to Mr. Furnivall's Table of the Facts of Chaucer's Life contained in his "Trial-Forewords to my Parallel-Text edition of Chaucer's Minor Poems," 1871. These "additions" will comprise a reference to, and a short statement of the result of, all the Chaucer records lately found by Mr. Furnivall in the Public Record Office and the Town Clerk's Office at the Guildhall. Mr. Selby's subsequent discoveries will be issued in separate sheets as they occur. The first, on the robberies of Chaucer, will probably be ready in two months. With the "Additions" above-named will be issued at once No. 10. Of the Second Series, the issue for 1875 is:—

"Originals and Analogues of Chaucer's Canterbury Tales. Part II. 6. Alphonsus of Lincoln, a Story like the Prioress's Tale. 7. How Reynard caught Chanticleer, the source of the Nun's-Priest's Tale. 8. Two Italian Stories, and a Latin one, like the Pardoner's Tale. 9. The Tale of the Priest's Bladder, a story like the Summoner's Tale, being 'Li dis de le Vescie a Prestre,' par Jakes de Basiv. 10. Petrarch's Latin Tale of Griseldis (with Boccaccio's Story from which it was re-told), the original of the Clerk's Tale. 11. Five Versions of a Pear-tree Story like that in the Merchant's Tale. 12. Four Versions of the Life of Saint Cecilia, the original of the Second Nun's Tale."

THE *Ny Illustreret Tidende* for February 15 contains a biography, by Alfred Larsen, of G. A. Schneider, whose unexpected and lamented death by suicide we noticed directly it occurred last year. The writer considers that in this painter Norwegian art lost "one of the most delicate, most elevated, and most gifted geniuses that it has ever possessed." A design by the dead painter which accompanies the article fails to support this opinion, which, however, seems to be general in the north. Schneider was born in 1832.

THE Danish public has for years past been waiting with anxiety for the *Reminiscences* of the eminent novelist, M. A. Goldschmidt. The book is said to be finished at last. It is rumoured that its publication will throw light on many mysterious points in the literary and political life of Denmark since 1840.

SOME months since we introduced Count Snoilsky to our readers as by far the most promising of the younger Swedish poets. Since our review of his *Sonnetter*, an earlier volume of lyrics has come into our hands (*Dikter af Carl Snoilsky*,

Seligmann). This book presents in a rather exaggerated form the qualities we perceived in the sonnets. Snolksy possesses great fervour of imagination, fine and flexible form, and an essentially modern spirit in treating poetic themes, but his inspiration is limited and uncertain, and if there are five poems in the book far above the general average, we must confess there are twenty that are somewhat below it. We understand that Mr. O'Shaughnessy, who takes a warm interest in Swedish literature, is about to publish a translation of the longest and best of these lyrics, *Nero's Golden House*.

MESSRS. CLARK, of Edinburgh, have in preparation a translation (with the sanction of the editor) of Oehler's *Biblical Theology of the Old Testament*, and, with the sanction of the author, a translation, by Caspar René Gregory, of Dr. Luthardt's *Commentary on St. John's Gospel*, from early sheets of a new edition about to be published.

It is proposed to celebrate the 400th jubilee of the University of Upsala, in the year 1877, when the foundation stone is to be laid of a new building, intended to include the various halls and museums required for the fulfilment of the objects aimed at by the directors of the projected scheme.

THE Finance Minister of the German Imperial Government has explained in the House of Representatives, in reply to Dr. Vogt's charge of inadequate payment on the part of the authorities to the University professors in Germany, that he has added half a million to the grant for educational and scientific purposes connected with the Universities within the last three years. Dr. Vogt is, however, of opinion that it will need double that sum to rectify to any extent the numerous deficiencies under which the Universities are at present labouring.

THE plan which was under discussion some years ago for erecting a public library at Cologne, but which had to be set aside on account of the war, has now again been brought forward. It is proposed to erect a building which shall combine the necessary space for a library and for halls to be used by the various medical and other learned societies, which are desirous of combining in the undertaking. As the city of Cologne is rich in the possession of a valuable collection of archives, deeds, MSS., and books, which have hitherto been almost inaccessible to the public, the projected scheme for bringing these scattered treasures under one roof is worthy of the great Rhenish capital of the German empire.

MESSRS. WILLIAMS & NORGATE have issued a very handy little translation of two essays, by Dr. William Bacher, on Nizami, a Persian poet of the twelfth century, and one of the earliest masters of the romantic epic. The first contains an account of his life and writings; the date of his death is fixed, upon the evidence of his writings, at A.H. 599 instead of 576, which seems to rest on little better than a blunder of Daulet Shah. There is a very interesting account of his conversion from dry asceticism to free spiritual poetical fervour. The second essay is taken up with an analysis and specimens of the second part of his *Alexander-Bock*, giving the imaginary adventures of Alexander as a missionary prophet and philosopher. This part of Nizami's works has slipped out of many MSS. of the collected bodies of his writings, because the subject was afterwards taken up by Jami, and the later poem displaced the earlier.

THE *Gazzetta d'Italia* announces the death on the 6th of this month, at the age of sixty-three, of Domenico Promis, librarian to the King of Italy at Turin. The deceased was one of the most distinguished literati of Italy, and was member of numerous learned societies abroad as well as in his own country.

THE German Emperor has given his consent to the purchase, at the cost of Government, of the library of the late Dr. Wolfgang Menzel of Stutt-

gard, consisting of 18,400 volumes for the University and District Library at present being organised at Strassburg.

ALL readers whom Russian Imperial marriages interest should peruse M. Alfred Rambaud's excellent article on "L'Impératrice Catherine II. dans sa Famille, d'après des documents récemment publiés," in the number for the first half of this month of the *Revue des deux Mondes*. In it he tells the story of two weddings, each of which was doomed to complete its festive nuptial drama by the gloomy tragedy of a secret assassination. Thanks to his clear and brilliant narrative, we become well acquainted with the family history of the Russian Court during a considerable period of the reigns of Elizabeth and Catherine II. We see the girlish Sophia of Anhalt ordered off to Russia as the bride elect of the dull and brutal heir to the throne. We are present at her theological lessons, at the end of which she finds that between the teaching of the Greek Church and the "Chateausme" of Luther "il n'y a que les mots de changés." We sympathise with the early troubles of her wedded life, the dreary years passed among "bigots and hypocrites." We hear her order General Suvorof to provide her dethroned husband, Peter III., with a doctor and a negro, as well as with "his violin and his dog Mops," and we witness her sorrow when, in spite of her kind attempts to console her imprisoned lord, his fear flies to his stomach and he dies—as Paul I. will die after him. In the second part of his article M. Rambaud makes us equally well acquainted with the ill-omened marriage of Dorothea of Würtemberg to the mad Grand Duke Paul. Again we witness the sad scene of a young life clouded by suspicion and embittered by jealousy—a life darkened to our eyes by the terrible storm-cloud which we know is destined for a time to eclipse its midday light, permanently to shadow its later years. Then, returning to the great Empress, M. Rambaud, with a quick and delicate touch, paints the portrait of the Semiramis of the North as she really was, her diadem bright with the lustre of her public career, her brow darkened by the infamy of her private life. M. Rambaud is doing good service by his contributions to Russian history, and it is to be hoped that the *Revue* will give us many more of them.

A WORK was presented, on the 21st instant, to the French Académie des Sciences Morales et Politiques, entitled *L'Etat de la France au 18 Brumaire*, based on the reports of the Councillors of State charged to enquire into the situation of the Republic. The author, M. Rocquain, has found in the public archives, and published, many original and confidential reports addressed to the First Consul by François de Nantes, Barbé-Marbois, Fourcroy, General Lacuée, Najac, Duchâtel, Thibaudeau, Redon, and Regnaud de Saint-Jean d'Angély. They throw considerable light on the material, moral, and political position of France at the time, and are followed by an appendix containing various documents relating to the Directory.

THE Master of the Rolls lately recommended to the Treasury several works to be published during the coming financial year among the Chronicles and Memorials of Great Britain and Ireland, in continuation of the series begun by Lord Romilly, and the Treasury has selected the following from the list:—

Materials for the History of Archbishop Thomas Becket. Edited by the Rev. J. C. Robertson, Canon of Canterbury, and Professor of Ecclesiastical History in King's College, London. These materials, consisting of lives, letters, &c., are said to be of the greatest value and interest, not only on account of their main subject—the contest between the ecclesiastical and civil powers in the twelfth century—but for the light which they throw on manners and customs, on the state of knowledge and learning, on general and personal history, &c.

The Register of Malmesbury Abbey. Edited by the Rev. J. S. Brewer, Professor of English Literature in King's College, London. This publication is of a nature intended to illustrate many curious points of history, and the growth of society, the distribution and cultivation of land, and the relations of landlord and tenant; the utility of these registers has often been insisted upon by great lawyers and antiquaries like Selden and Twysden.

The Historical Works of Ralph de Diceto, Dean of St. Paul's, from 1181 to 1210. Edited by the Rev. William Stubbs, Professor of Modern History at Oxford. This volume will make complete the series of works on the reigns of Henry II. and Richard I., on which Mr. Stubbs has previously been engaged.

The Year Books of 33, 34, and 35 Edward I. Edited by Mr. Alfred J. Horwood, of the Middle Temple. This work is in continuation of a series already published relating to that reign, under the same editorial care.

THE Treasury has also given its sanction for the association of Mr. Gudbrand Vigfusson, the distinguished northern philologist, with Dr. Dasent in editing the Icelandic Sagas relating to the British Isles, a work which has been for some time in preparation for the Rolls Series. Mr. Vigfusson has been recently employed in the compilation of the Icelandic and English Dictionary, published for the Delegates of the Oxford Press. In consequence of the Treasury arrangement, he will shortly proceed to Copenhagen to transcribe the Sagas there which will form a portion of the collection.

DR. PAUL SCHEFFER-BOICHORST, who proved some time ago the spuriousness of the Florentine History passing under the name of "Malespini," is about to publish another book called *Contributions to Florentine Historiography (Zur Geschichtsschreibung der Florentiner)*. Leipzig: (Hirzel), which will include a revised form of his previous researches, and, moreover, give the *coup de grâce* to another great Florentine name, Dino Compagni. Dr. Boicchorst hopes to prove that the work passing as Dino Compagni's is an invention of the fifteenth century.

THE reprint of the *Mémoires de Saint-Simon*, and their editor's difficulties, have produced a general wish among French literary men for a reform in the administration of the public archives. The Government has recognised this necessity, and has nominated a Commission on the subject consisting of MM. Weiss, Valfrey, Hervé, de Viel-Castel, d'Haussonville, Geffroy, and others. The instructions of the Commission are to enquire whether the State should not be asked to grant a sum of money for the publication, under ministerial surveillance, of a series of inedited documents, and to devise some means of ensuring that, on the death of ambassadors and public servants abroad, their correspondence and diplomatic papers shall henceforth be returned to the Foreign Office. But this is not a very great step in advance. What is required is that the documents belonging to the Foreign Office, the War Office, and other departments of the State, should be collected and placed in a State Paper Office, and that all students should be allowed to consult and make extracts from them for themselves, without any official intervention. This has been done in most other countries—Belgium, England, Italy; and French scholars have a right to demand that it shall be done also in France.

THE *Nation* has a note on the "History of the Welsh in America," by the Rev. R. D. Thomas. The work should be exhaustive, as the author begins with a short sketch of the ancient Britons in Wales, and discusses, answering finally in the negative, the question whether Madoc went to America. The most considerable immigrations were, that to Pennsylvania, 1682-1730, and that of 1795-1805. Another contribution to early American history and genealogy is the first number of Vol. V. of the *New York Genealogical and Biographical Record*, which begins the republication

of the *Doopboek*, or Book of Baptism of the Reformed Dutch Church in New York.

CHURCH historians have to thank Professor Hoffmann, of Kiel, for a contribution to the knowledge of the Second Synod of Ephesus, held A.D. 449. Wherever the Greek original exists he has reprinted it with variants derived from the Syriac. The new portions are given in a German translation. The whole forms a handsome little quarto, and is brought out by the University of Kiel in honour of the "Doctor-Jubilee" of Professor Olshausen, the Orientalist.

MR. J. E. BAILEY, of Stretford, Manchester, has in the press a Life of Dr. Thomas Fuller, whose *Worthies* is still the grandest portrait gallery we have of famous Englishmen. For the first time an adequate biography of Fuller will be given to the world, with fresh facts, notes of inedited works, and a complete bibliography. The book, which embodies the result of some years of patient research, will contain many portraits, views and fac-similes. Amongst the illustrations will be the rare portrait which sometimes occurs in copies of the *Abel Redivivus*. Copies possessing this have sold for 9l. The impressions for Mr. Bailey's book will, curious to say, be taken from the original plate. There will also be a photograph of the portrait in Lord Fitz-Hardinge's collection, at Cranford House, Middlesex, in which the expression is much more genial and animated than in Loggan's engraving, which has perhaps been taken from it. The witty and wise parson bulks so largely in this portrait, that one can well understand the many jokes about this mighty mass of "Fuller's earth."

NOTES OF TRAVEL.

WE understand that Mr. Vambéry has lately arrived in England, and intends giving a series of lectures in the provinces on Russia and her designs in Central Asia. Mr. Vambéry's views, it is well known, are anything but favourable to the policy at present being pursued by the Russian Government, and we await their exposition with much interest. We shall also be curious to see if the learned Professor will deem it advisable to make any reply to the few detractors who have so persistently thrown doubts on his ever having personally visited many of the places he describes so graphically. For ourselves we should consider Mr. Vambéry would best do justice to his reputation by treating their insinuations with the silence they deserve.

WE republish the latest telegram received concerning the death of Dr. Livingstone, by which it will be seen that there is now no ground for hope that the reports hitherto received have been untrue:—

"Chumah, Livingstone's servant, arrived here on February 3, and returned next day with stores for Murphy, who was ten days' journey from Bagamoyo in charge of Livingstone's body and papers. Dillon also started from Unyamwebe, but shot himself in a fit of delirium a few days afterwards, Cameron has proceeded alone to Ujiji."

We presume that on arrival of the remains at Zanzibar steps will be taken to identify the body as that of the deceased traveller. Dr. Livingstone's arm was broken by a lion some years ago, and never regained its original form. This fact will afford a crucial test of identity even to any one who was not personally acquainted with him, and it is to be hoped that, in the absence of Dr. Kirk, there may be some one at Zanzibar who is aware of this fact. We gather from the above telegram that Cameron must have been already far on his way to Ujiji before the lamentable death of Dr. Dillon, and we can now only cordially trust that the news may not reach him to discourage and dishearten him in the solitary task that he has undertaken. The courage and energy displayed by Lieut. Cameron in thus pushing on by himself to Ujiji commands our admiration; it may well be that the most

valuable results of Dr. Livingstone's labours will thereby be saved from destruction. The news of Dr. Dillon's sad end will cause the deepest pain to all who knew him. It speaks volumes of the destructive nature of the climate in which these three adventurers have been travelling, that a man who, like Dr. Dillon, started for the coast in the highest health and spirits, full of energy and pluck, should in so short space of time have become so utterly unmanned by repeated sickness and disease as to die in the way in which he did. We can but mourn the fact that another brave man has thus fallen a victim to the slow process of civilising Africa.

AMONGST the different expeditions, all more or less of a scientific character, which have been conducted of late years in Western North America, the northernmost is that of the International Northern Boundary Commission, which is completing its survey of the boundary line along the forty-ninth parallel of latitude, from the Lake of the Woods to the Rocky Mountains. This party is under the direction of Mr. Archibald Campbell, assisted by Major Twining as engineer officer, and Dr. Elliot Cowes as naturalist and scientific member. The next worthy of mention is the "Yellowstone Expedition," which started from Fort Abraham Lincoln, on the Missouri, the present terminus of the North Pacific Railroad, and which has already accomplished the first part of its projected route, from the Missouri as far as the banks of the Yellowstone. Thence it will follow the course of the latter stream, and will make for the Rocky Mountain chain, just to the south of the town of Helena. At the outset it was thought necessary to attach a body of about 2,000 men to the expedition, because of the known unfriendliness of the Indians. The chief savants are—Dr. J. A. Allen, from Cambridge, U.S., zoologist and botanist, Dr. Lionel R. Rettre, from New York, mineralogist and geologist, and assistants.

Professor Hayden's expedition and its labours commenced, in 1867, with a geological survey of Nebraska. The following year was taken up with a survey of Wyoming, and in 1869 Colorado and New Mexico were visited. Subsequently a portion of Montana and the famous Yellowstone district were explored, and in 1872 the expenditure had actually risen from 5,000 dollars in the year 1867 to 75,000l. sterling. Last year the extent of country which still remained to be traversed lay south of the fortieth parallel of latitude, from the Green River on the west to the eastern foot of the Rocky Mountains. In time Professor Hayden hopes to push on to the Mexican border. Silver and lead ores have been discovered in the vicinity of the Arkansas and Blue Rivers, the former yielding 250 to 300 oz. of metal per ton. Fossils occur at intervals in Silurian and carboniferous rocks, and entomology has been enriched by the capture of no fewer than 227 different species of the grasshopper genus.

A private expedition from Yale College, under the direction of Professor D. C. Marsh, is occupied with the investigation of fossils in the tertiary and calcareous formations. They receive aid from government in the shape of an escort, and their labours during the last six years have been directed to the basins of the Platte and the Green rivers, to a portion of Oregon and Wyoming, and southward as far as the borders of Utah.

In conclusion may be mentioned the name of Mr. W. H. Dall, who is engaged on coast surveys of Alaska, and who intends to travel on to the Aleutian Islands for the purpose of mapping them out and finding a suitable landing place for the projected Pacific cable.

Commercial Reports—China, No. 3 (1873). II.—In reporting on the trade of Shanghai, Mr. Medhurst alludes to the failure of an attempt to make a sugar refinery answer, and tells us that "the intensely utilitarian spirit of the Chinese makes it perfectly immaterial whether the sugar they buy is crude or refined, their object being to buy sweet sugar at the lowest price. . . More coarse and

disagreeable-looking stuff than the sugar and salt sold and consumed everywhere throughout China it would be difficult to conceive." We have been obliged to use both, and can fully endorse this opinion. The same writer mentions that the Chinese arsenal at Kao Chang Miao, near Shanghai, daily turns out twenty Remington rifles complete; and that "Downton's pumps and a vast variety of other articles of a complex character were everywhere in the hands of the workmen. In front of the arsenal was anchored a steam frigate, pierced for twenty-six guns, measuring between 2,000 and 3,000 tons, and of 400 horse power, which had just been turned out of dock: and every part of this vessel, with the sole exception of the screw-shaft and cranks, had been manufactured on the spot." As this is the fifth vessel which has been launched from the same place, it is clear that the Chinese are making progress.

In these days of dear coal at home we are roused to envy when we read in the Report of Mr. Baber (Tamsuy, Formosa) that for household purposes Kelung coal has no superior, and that eighteen shillings per ton is the outside price for the very best *picked* coal; at the pit's mouth the price is about ten shillings per ton. Mining operations are in a very elementary condition in Formosa, for "the ventilation of the mines is left to itself, and no system of pumping out the water is employed." Oddly enough, fire-damp is unknown. We must agree with Mr. Baber in his remark that, "considering the present high price of English coal [in China], it is somewhat surprising that our naval authorities have not turned their attention to Kelung as a source of supply for the vessels of the China squadron;" the more so as the price of the coal is less than a quarter of that of Australian, and has been favourably reported upon by naval and other engineers.

The Report of Mr. E. B. Malet, C.B. (Secretary of Legation at Peking) is rather disappointing, for practically he does little but summarise the Consuls' Reports, and we had hoped for great things from so able and energetic a man. Under the head of "Shipping" he mentions that a native line of steamers has been established, "under the protection, and, it is said, subvention of high Chinese authorities; . . . the shares (in the company) are said not to be transferable to foreigners. Steamers of the line are to be employed in bringing up the tribute rice to Tientsin. . . . For the present the line is to confine itself to the Treaty ports, but if it is successful it may be expected, in the natural order of events, that the directors will run it to other ports, thereby giving new inlets to our exports to China; but the establishment of the line may cause serious damage to our carrying trade in Chinese waters." Adverting to the statement of a sanguine Consular officer, that "foreign appliances for working the coal mines, and proper means of transport are alone required to give an important trade" in the Newchwang district, Mr. Malet rightly remarks that "these are desiderata which are alone wanting in most districts of China to change the face of the land."

It is to be regretted that the Trade Reports from China cannot be published rather sooner; those just issued are all for 1872. We thought that there was a rule that they should reach London by the end of June in each year.

In compliance with instructions from his Government, the Portuguese Governor of Macao, who is also Envoy to China, &c., has issued a proclamation, notifying that the detestable Macao Coolie trade will be abolished after March 27 next.

POSTAL arrangements seem to be carried on under difficulties in China. Twice in one week has the regular mail between Shanghai and Soochow been robbed lately. As the Chinese are in the habit of making remittances through the Post Office, no doubt the thieves secured a respectable booty.

A MAP of the Aleutian Islands and the peninsula of Alaska has just been published by M. Pinart, a French traveller, who has embodied therein some important geographical results obtained by him during an exploring trip in the latter part of 1871. These results consist mainly of a number of positions astronomically determined, the heights by barometer of two volcanoes, Mounts Pogrumnoi and Shishaldinsky (5,843 and 8,782 Paris feet, respectively), and some relics of an ancient race who formerly inhabited these regions, found in some caves on Ounga Island. M. Pinart's detailed account published in the *Bulletin* of the Paris Geographical Society, conveys a very complete notion of the scenery and general character of this little known portion of North America.

FROM Peking we learn that during the night of December 21, the Emperor of China, in accordance with ancient practice, proceeded to the Altar of Heaven, in the southern part of what is known to foreigners as the Chinese city, to worship and celebrate the arrival of the Winter Solstice. These Chinese state processions commonly pass through Peking in the night, for the double purpose of protecting the sacred person of the "Son of Heaven" from the vulgar gaze, and of avoiding interference with the street traffic.

THE *St. Petersburg Journal* points out the source of the uncomplimentary account of the conduct of the European envoys on their presentation to the Emperor of China (*ACADEMY*, No. 87, p. 13). It first appeared in a pamphlet published by the anti-European party, as a supplement to the provincial issue of the *Peking Gazette*, similar in form, type, and all respects to the official paper. Internal evidence goes to prove that it was composed at Peking, and that no official personages had any share in it. We notice with pleasure that the divinity that hedges the Emperor produced as strong an effect on the other envoys as on the English representative, for they also fell to the ground several times, without being able to utter a word.

THE *Times* quotes from the *Brisbane Courier* of December 13 an account of the passage from Singapore to Brisbane by a person on board the screw steamer *Sunfoo*, the pioneer vessel of the Eastern and Australian Mail Steam Company (Limited). He says:—"The arrival of the pioneer steamer of a new mail route, which will, doubtless, be the means of opening up and establishing important commercial relations between Eastern Australia, Java, Singapore, and China, is an event of more than ordinary importance; therefore a few notes on the voyage of the *Sunfoo* may not prove uninteresting to your readers. We experienced delightful weather throughout, and the voyage was one long pleasure trip. By this route the timorous traveller not only escapes the dangers of an ocean voyage in hurricane latitudes, but the monotony of the sea trip is broken by an ever-changing panorama of lovely scenery the whole passage through—two days being the longest time we were out of sight of land. Leaving Brisbane, as the steamer threads her way through innumerable islands, the traveller has ample time to admire the beauty of the Queensland coast line and to watch the changes as he goes further north, where the country is less fertile, but not the less picturesque. Leaving Cape York, you soon approach the islands of the Indian Ocean. At first you are struck by their rugged grandeur, jagged mountains towering to the height of 10,000 feet, and presenting a black, scorched, and barren appearance. Passing Sumbawa, you see the mountain of volcanic celebrity which in 1815 threw its ashes over an area of 1,500 miles. As you go to the westward, the beauty of the scene is enhanced by the tropical vegetation which clothes the mountains and islands to the water's edge. Passing through Bali Strait which is only one mile wide, one of the most lovely views in the Archipelago meets the eye. On each side native leaf huts are seen, half hid

in cocoanut and areca palms. On the left rise the mountains of Java—evidently volcanic—to the height of over 11,000 feet, covered with verdure from base to summit. On the right rise the mountains of Bali, similar in shape, and about 4,000 feet high. On reaching Batavia the passenger has just sufficient time to make a hurried examination of that interesting city; a railway takes you in two hours to Buitenzorg. Leaving Batavia, you steam through the thousand islands, and passing through Banca Straits reach Singapore—the sea like a lake the whole way. The establishment of this line will doubtless dispel the bugbear of the supposed insurmountable difficulties of the inner route and Torres Straits navigation."

Petermann's *Mittheilungen* for February furnish us with an account of Captain Prshewalski's recent travels through Koko-Nor and northern Thibet. He and his comrades started in September 1872 from the town of Chebsen, and journeyed into the valley of Lake Koko-Nor, the great beauty and picturesqueness of which they were much struck with. The steppes around are very fertile and abound in antelopes. The height of the lake is about 10,000 feet above sea level. Captain Prshewalski intended to have journeyed to H'Lassa, but ran so short of money that he was unable to go further. Their clothes and shoes were dropping to pieces, and they had to supply their place with skins; and they were furthermore exposed to such privations from hunger and cold that, on their eventual return to Dyn-juan-jin, the Mongolian exclaimed, "Why, you are exactly like one of ourselves in appearance." Travelling southward from Koko-Nor, they came into the marshy country of Chaidam, which is bounded on the north by the range enclosing Koko-Nor, on the south by the Burkhan-Buda chain, and stretches westward, according to native report, as far as Lob-Nor. Wild camels are plentiful here. The plain of Chaidam is 1,000 feet lower than Lake Koko-Nor, and is consequently of a warmer climate. The river Bayan-gol, 400 versts long, and of an average breadth, flows through it from east to west. On November 20 they reached the foot of the Burkhan-Buda range, which forms the northern boundary of the Thibetan plateau (from 14,000 to 15,000 feet high). From it the Shuga and Gurbu-Naidji ranges arise, both of which reach the height of perpetual snows. The latter forms the commencement of the Kuen-Lun system, which bounds the west part of Chaidam, and the plains of Lob-Nor to the south. About fifty versts to the eastward, and 100 versts south of the Kuen-Lun, they came upon the banks of the Yang-tse-kiang or Murni-ussu, as the Mongolians call it. From this point they began their return journey, on January 13, and reached Dyn-juan-jin on June 15, 1873. Captain Prshewalski's collections of the fauna of Mongolia are large, comprising more than 1,000 species of birds, 40 large mammals, and upwards of 100 smaller; his detailed experiences of the wonderful vitality and strength of the yaks are very interesting to read. He made latitude observations at the mouth of the Bukhain-gol, at the northern foot of the Burkhan-Buda, and on the Murni-ussu. Height observations were made frequently, and Captain Prshewalski has constructed an elaborate map, showing all his routes and embracing the country between Lake Dalai-Nor and the upper Yang-tse-kiang.

The other articles in the February number of the *Mittheilungen* comprise a valuable obituary notice of all celebrated scientific men who died in 1873; a short geographical sketch of Persia, with reference to the labours of the recent boundary commission; and a detailed notice of Count Wiltzek's recent Arctic journey, in 1872, to Spitzbergen and Nova Zembla.

MR. SHIRLEY BROOKS.

MR. SHIRLEY BROOKS, who died last Monday, at the age of fifty-eight, was editor of *Punch*, and something more than that, for he had made for

himself an independent position in the profession of Literature, having done much original work which never fell below a good standard. The very qualities which enabled him to produce so many good things of so many different kinds—for he tried every thing in the range of Belles Lettres, and in nothing did he actually fail—were of excellent service to him in his editorial labour. He had many abilities, immense tolerance, and wide appreciation. He knew something of books, and more of men, and all of London that lies between the Temple and Pimlico. He was a man to whom creative work was easy, and critical work still easier. And his "easy writing" was not "hard reading." He seemed to have been born with the power of conveying information pleasantly.

Probably Mr. Brooks enjoyed his profession. Certainly he practised it with assiduity, and was proud of his power of labour. He has been known to write three articles of a morning, finishing off with a "London Letter" to a high-class paper in the country, and capping all with a comic note to the editor of that journal, recounting with glee and triumph his achievements of the day. With such rapidity, it may be thought that he could not possibly be thorough; but that is not so at all, for he had the sagacity to avoid the subjects he did not quite understand. He was a master of current politics and of the lighter social questions. He knew a good operative performance from a bad one. He knew more about all Art than the large English public ever cared for him to tell them, but what he did tell he told pleasantly. Thirty years of hurried journalism did not succeed in spoiling his style.

And if Mr. Brooks enjoyed his work, he surely enjoyed society. He was a man of high social qualities. People liked to have him at their dinner tables, and no doubt he liked to go. Perhaps few persons in our time have talked so resolutely well. From day to day he had to write sharp things—it became a second nature to say them.

It is early to attempt even to indicate what will be Mr. Brooks's final position in literature—that is a task from which we should at all events shrink. But this it may be safe to say—that his position in literature might have been a higher one if the pressing occupations of a journalist had not broken in so much upon his larger imaginative work. His plays, written now nearly a generation ago, were the fair successes of a season. His novels, which abound in brisk and pointed dialogue and happy descriptions, must have had greater unity—and therefore greater power—if he had always struck his anvil while it was very hot, and allowed nothing to come between his work's conception and its end. But some of the stories were planned long before they could be executed. In the manner of them—at least in certain scenes of *Aspen Court* and of *The Gordian Knot*—there is something that reminds one of Thackeray. Mr. Brooks's style was scarcely less complete: his satire scarcely less quiet; but when one thinks not only of the multiplicity of his labours, but that Thackeray was, in his kind, the one man of a century, one does not wonder that in *The Gordian Knot* and *Aspen Court* there is no character of the strength, wholeness, individuality of Becky Sharp and Major Pendennis. Mr. Brooks's strongest plot is that of *The Silver Cord*—a novel originally published in *Once a Week*—but in making so much of his plot he did but enter into a useless rivalry with many writers who in intellectual quality were a good deal below him. Possibly his power was least accompanied by weakness when he set himself to display, not so much character as characteristics, in a series of brilliant dialogues. The best of these appeared in *Punch*, and were separately republished: the little work about the bickerings of "The Naggletons" is almost equal to the lighter work of a profounder analyst, Balzac—at least it reminds one, not unworthily, of *Les Petites Misères de la Vie Conjugale*.

On heard, some years ago, that it was Mr. Brocks's ambition to write a whole number of *Punch*. Such was his perseverance and his fertility that he may have succeeded in realising that ambition; but whether he did or no, the very idea is suggestive of the amount of work he was accustomed to undertake. His intimates are regretting the loss of an old friend and good comrade. We of the general public are regretting the comparatively early cessation of his labours—the fact that when he was fifty-eight the world should have received the last fruit of a mind so bright, and until the last so fresh. Thus there is other cause than that which is afforded by his published writings to remember that he was of the profession of letters, and to associate, not only his career but his end, with those of his greater brethren, Jerrold, Thackeray, and Dickens.

CORRESPONDENCE.

THE MOABITE POTTERY OF M. SHAPIRA.

New York: Feb. 6, 1874.

The exposure by M. Clermont Ganneau of the Shapira forgeries justifies the scepticism of the officers of the Palestine Exploration Fund, and not less of the American Palestine Exploration Society. As the American Society has its field in the region in which these inscriptions and objects of pottery were represented as having been found, they were very early offered to its representatives in Syria, and copies of the inscriptions or squeezes of several of them were sent to this

country. These were examined by Mr. A. Van Name, librarian of Yale College; Professor J. A. Paine, now in the service of the society in Syria; and myself, and two of us presented papers to the American Oriental Society nearly two years ago exposing the fraud on palaeographical grounds. The Palestine Exploration Society has refused to make any purchases of M. Shapira, although at times strongly urged to do so by those who had a great deal of faith in his personal honesty. The unaccountable facility with which Professor Schlottmann, an acknowledged authority, and other German Semitic scholars, have accepted these "*Moabitische Räthsel*," as well as the reports of the "*Licenciat*," who reported that he found them *in situ* and saw them dug out, somewhat startled us, although we remembered that in America "mines" have sometimes been "salted" with gold-dust and diamonds. It was evident also that Professor Schlottmann was utterly unable to make connected sense out of a long inscription, which alone ought to have been sufficient to prove that it was not genuine. We know enough of the languages spoken in Palestine and its vicinity from 500 to 800 B.C. to be certain that a long and plain inscription, in characters with which we are perfectly acquainted, can be deciphered without difficulty. We also had frequent reports from Lieutenant Steever's exploring party that no relics or inscriptions such as were reputed could be heard of in Moab; and we were also informed that Shapira's agent had the reputation of being a famous swindler, being the same enterprising fellow who once claimed to have discovered in a cave the petrified bodies of the Seven Sleepers. The purchase of a large batch of these forgeries by the Prussian Government for the Berlin Museum is a humiliating blunder that ought not to have been possible under the advice of any scholar who had ever seen the squeezes of either of the larger inscriptions.

I may add that the American Palestine Exploration Society was threatened with the suspension of its activities by the sudden and severe mercantile panic, but that now, owing to the efforts of its President, Professor R. D. Hitchcock, D.D., it will doubtless be able to send a larger surveying party into the field in the coming season.

WILLIAM HAYES WARD.

DR. SCHLIEMANN'S COLLECTION.

Oxford: February 16, 1874.

Dr. Schliemann's great work has at last arrived, and after a cursory glance at the 217 plates of his *Atlas*, a few observations suggest themselves, which I venture to submit to the judgment of archaeologists. Is not the peculiar figure which occurs so often on the terra-cotta disks and elsewhere, and which goes now by the misleading name of *Svastika* (a mystic cross very common in India), an abbreviation of the human figure? If any one will compare the following disks, Nos. 36, 61, 259, 289, 296, 298, 299, 2, 429, 3, 105, 3, 143, 3, 318, 3, 413, watching at the same time the transition of the four-legged antlered animals into what seem almost letters, he can hardly doubt that the cross by their side is intended for a man. On disk 299, animals and men are separated by a river or a wall. In India, no doubt, the *Svastika* cross has another origin, and in Nicaragua and elsewhere its antecedents may again be different. But here its origin seems clear. It afterwards, no doubt, becomes a mere ornament, just like the duck-pattern on the old Italian bronze disks in the Museum of Perugia, if compared with the terra-cotta disk found at Villanova, the pottery of Sesto Calende, and the bronze shield found in Sweden.

I should like to call attention to a paper just published by Count Conestabile (*Sorra due Dischi in Bronzo Antico-Italici*, Torino, 1874), where the same cross occurs on vases which by their shape, too, recall some of Dr. Schliemann's vases. Some very small animal figures, too, drawn with hieroglyphic exactness, and very different from the antlered animals, occur in both.

One more remark. Whatever these curious disks may be—whether ornaments, coins, weights—it strikes me that some of them have astronomical designs, and I should wish an astronomer to examine them. In one, No. 452, I recognise the constellation of the Great Bear, with possibly a *Boötes*; and it may not be impossible to decipher some of the other constellations.

MAX MÜLLER.

MATERIALS FOR A LIFE OF GILLRAY.

Rolls Office.

With reference to Mr. W. B. Scott's notice last week in the *ACADEMY* of a new edition of Gillray's works, it will be suitable to draw the attention of all future editors of these works to a manuscript acquired some five years ago by the British Museum, which contains many curious letters and papers illustrative of the life of Gillray, and of the peculiar circumstances under which many of his caricatures were shadowed out. As little or no use appears ever to have been made of these materials, a condensed account of them may not be uninteresting. A few official papers establishing facts in the early career of the artist appear first in the volume, such as the following, signed by Adjutant John Ward:—

"Memorandum.—Thursday, February 28, 1754.—Mr. James Gillray resigned his place of Lighthorseman in Chelsea College, and went upon the nine pence a day list; he having exchanged with Wm. Grant."

There is also a most affectionate letter from Thomas Gillray to his "dear brother James," from Balerno, January 23, 1779, in which he expresses his sorrow to hear that his strength is fast decaying, and would like to know "if you have any Apitite for your Vittels and what Vittels agreth best with you." This is addressed to "Mr. James Gillray, in Mealmans Row, Corner Howse, Chealsea, near London."

Among the papers which directly relate to Gillray's profession, the following are chiefly to be noted.

Some correspondence about the year 1798 with Sir John Dalrymple; one letter from this gentleman begins thus:—

"Sir John Dalrymple returns his compts to Mr. Gilray. I certainly expected that so public-spirited an undertaking would have been supported by Government, and I have no doubt that it will. I shall go about this day and to-morrow, for which purpose you will send me half a dozen copys of the Popish Engraving, &c."

Several letters from Lord Bateman, suggesting subjects for caricature. One begins:—

"Shobden: Nov. 3, 1798.
 "Dear Mr. Gilray,—I take for granted you are very busy at this time. You have fine subjects to work on. The opposition are as low as we can wish them. You have been of infinite service in lowering them, and making them ridiculous. Sheridan, I find, has now declaredly left them. Tho' he is certainly very able and clever, yet his character is too well known for Mr. Pitt to give much to be silent. He may, if He is Rogue enough, be of use in disclosing all their wicked Schemes," &c.

Writing October 8, 1798, Lord Bateman hopes—

"you received the hare and brace of partridges, &c. I think you could make a good print of the Bay of Alexandria and the Line of Battle with the Heads of the Opposition round as a frame bemoaning the victory. Pray have something with the Bay and Lines of Battle, I know many of the opposition are sorry for this victory. With what triumph Mr. Pitt will open the Sessions. He is a lucky man. You cannot be too marked on this victory; we want nothing but Lord Bridport to do something to be complete. It is in your hands to lower the opposition; nothing mortifies them so much as being ridiculed and exposed in every window. . . . Pray be as severe as you can within the laws, nothing is too bad for such a sett of villians (*sic*) who can rejoice in the danger and ruin of their country."

In the postscript is added—

"We shall be very glad to see you here, and in the meantime shall be very glad to hear Buognoparte and his army are destroyed."

An agreement between Gillray and Mr. John Wright, of Piccadilly, bookseller, dated May 29, 1800, by which Gillray undertook to execute between thirty and forty plates for a royal quarto edition of the poetry of the *Anti-Jacobin*, before the succeeding December 1. Gillray, in return, was to receive three guineas a plate for those of the vignette size, five guineas for those which would occupy half the page, and eight guineas for the large size.

Correspondence with J. Hookham Frere about the same project, with a list of subscribers to the publication, including some of the best known names of the day ("near six hundred of the most respectable characters in the kingdom," writes Gillray himself in November, 1800).

Another correspondent is "F. Hawksworth," who dates from different Yorkshire country houses. In a letter of February 16, 1800, Hawksworth asks Gillray to depict a Yorkshire character of those days, of whom he encloses a rough sketch. He writes:—

"Orange Jumper is as well known in Yorkshire as the King of England. He has been a celebrated horse-breaker forty years, and his boast is that he has had every bone in his skin broken, and that he has been in every jail in England. He was the most conspicuous partisan at Lord Milton's election; they call him Orange Jumper from Lord M.'s colour. There was a gentleman very active on the other side, whom in derision they called *Blue Jumper* from Mr. Lascelles' colour. I think he will make a good companion."

After a very close description of the Jumper's personal appearance, he goes on—

"The scene is the post where he always stood at the election, just at the corner of *Elridges Tun*, York. Mr. Fawkes will be at the expense of etching this—but you may sell it, and I have no doubt from his being so universally known, that you may sell thousands."

In another letter from Hickleton, near Doncaster, Hawksworth encloses five guineas to cover Gillray's account for etching Sir George Savile's monument, and says:—

"I have begun etching myself, but I am so defeated in the attempt that I must apply to you for a little assistance. Will you be good enough to send me down a couple of needles and some wax, the same that you etch with yourself, and tell me how you lay it on, &c."

A letter in George Canning's hand, and franked by him, runs thus:—

"Sunday, April 23.

"It is particularly wished that the Print of Mr. Sheridan, No. 5 of the *French Habits*, which Mr. Gillray was so good as to send for inspection to-day, may not be published. If Mr. G. can call to-morrow, the reason will be explained to him."

Another letter is as follows:—

"Qui color albus erat, nunc est contrarius albus."

"November 29, 1803.

"My Dear Fellow,—You have done me the honor sometimes to illustrate my ideas, and I am tempted to see them in the vivid portraying of your pencil once again. As a hint that may be extended by your powers into something laughable—suppose the feelings of Mr. Sheridan in being so palpably detected in the dressing his friend Charles Fox in the borrow'd plumes of the Chertsey Volunteers. I would have the scene a dressing-room, Sheridan acting as valet, and Fox in the act of thrusting his arms through the sleeves of the jacket. Fox's head should be averted from the door (and dressed in some cajoling smiles), thro' which a boy should be entering with the packet of resolutions of the Chertsey Volunteers, which Sheridan should (not?) in his confusion appear at once to understand. 'Do you take me?'—Yours, "G. G. S."

The date of the above has evidently been filled in afterwards by a different person; but if Canning were accused of inditing the letter itself, I think no expert in handwriting could be found willing to undertake his defence.

But one more specimen of Gillray's correspondence need be given:—

"Captain Braddyll incloses a portrait which he thinks will sell well; it is the resemblance of the

Rt. Honble T. Wallace, and Captain B. flatters himself it is a *correct* likeness. If Mr. Gillray can see him before he etches it so much the better, but the dress Captain B. has drawn him in is one he very commonly wears, a dark-brown great coat and shoes and stockings, but Mr. G. may do this as he thinks best; anything else he thinks likely to add to the effect he can introduce. Mr. W. is a Privy Counsellor and a Commissioner of the Board of Control for India."

"February 4, 1805.

"This additional motto would have a good effect—'Why, how now, Malvolio, what is the matter with thee?'—Shakespeare, *Twelfth Night*.

"This would perhaps be better than the quotation from Gay's *Fables*."

The latter portion of this manuscript volume is filled chiefly with anonymous communications to Gillray, proposing various personages and public events as suitable matter for his pencil. The majority of these seem dictated by personal malice; some of them, too, are of an inexpressibly coarse character.

J. J. CARTWRIGHT.

A REVOLUTION IN PSYCHOLOGY.

14 Maryland Road, W.: Feb. 18.

An Italian shopkeeper once replied to an English lady, who had asked the meaning of a disturbance at the other end of the street, "Niente, signora, nientissimo; rivoluzione." This is not an explaining away of that comment of mine on Mr. Lewes to which Mr. Shadworth Hodgson has taken exception; when I said revolution I really meant revolution,—but at the same time when I said psychology I really meant psychology. And this is the source of the apparent difference of opinion between Mr. Hodgson and myself. When metaphysicians have become so numerous, and talk so frequently to one another, that they use a few important words in the same sense, there will be brought about through this action of the social medium that clear conception of the main questions at issue which will amount to a common method and a common doctrine.

Mr. Hodgson distinguishes between "the science of psychical phenomena in general," which "is another name for metaphysic," and "the science of psychical phenomena in their relation to the *sentient organism* in which they arise," which is "psychology proper as distinguished from metaphysic." I understand that by metaphysic or general psychology he means the study of the general conditions of (human?) psychic facts (the mind in relation to its objects) *by means of the direct interrogation of consciousness*. Now there is certainly a most important distinction between such metaphysic and that study of psychic facts which proceeds by help of the hypothesis that consciousness is simultaneous with certain disturbances in the nervous system, and that its complexity is parallel with the complexity of those disturbances. But from the empirical or scientific point of view I have no choice except to say that the former is no science at all, and that the latter is the whole of psychology. Direct consciousness is untrustworthy evidence on the question of its own universal conditions. Our knowledge of psychic laws only becomes exact and verifiable by aid of the hypothesis just stated; which, like many others, can only be directly verified in the roughest way, but which is tested with great delicacy by means of its indirect consequences. It is in psychology proper, then, that I affirm a revolution involved in Mr. Lewes's sense of relative importance, when he explicitly drew from sociology the data for at least one-half of this science.

Just as the necessary and universal conditions of perception are supplied to psychology by biological data, viz., the constitution of the organs of sense; so the necessary and universal conditions of intelligence and conscience, of all the higher forms of mental action, are now supplied to psy-

* *Time and Space*, chap. i., "The Scope of Metaphysic."

chology by sociological data—the gregarious nature of man, the natural selection of those tribes that could best work together, the onslaught of epidemic diseases and delusions. All my objective sight-perceptions must be such as could be represented on the curved surface of my retinas. All my clear thoughts must be such as can be talked about to other people. As the biological medium supplies the conditions of perception, so the social medium supplies the conditions of thought. But the social medium must act upon the organism, and so these conditions are really reduced to the previous ones? Theoretically, yes; practically, no. Biology is not yet far advanced enough as regards the intimate structure of the brain to supply us with data for studying the conditions of intellect and conscience. Sociology enables us to cut the knot that is left for posterity to untie. Here is a parallel case. The motion of a solid body is really made up of the motions of its particles, and we should be able to deduce it from these if we knew enough about them. We do, however, study the motion of a solid body by accepting this datum from the sociology of molecules—that their motions in this case are such as not to alter appreciably their relative distances. "Rigid dynamics" is a well worked-out part of mathematical physics; but nobody to this day knows what are the molecular relations that make a rigid body to be rigid. Just so one half of psychology is made accessible by the acceptance of data from sociology; but nobody knows the precise action of social influences upon the organism, and this is not requisite to the development of the science in its most useful and important part.

"To introduce sociological data into general psychology is no revolution at all; it is what has always been done." Certainly men have analysed by direct interrogation of consciousness their ideas of the moral and social relations; but this is not in question. No psychologist that I am aware of (except Comte and Mr. Lewes) has explicitly sought the general conditions of intelligence in the practical needs of language and of gregarious living. The method has indeed (as I indicated) been unconsciously used by other than psychologists; but it amounts to a revolution in any science when a true scientific method is first explicitly and systematically applied to one half of it.

W. K. CLIFFORD.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Feb. 28, 3 p.m.	Crystal Palace Concerts: Mr. Ebenezer Prout's new Symphony.
MONDAY, March 2, 1 p.m.	Sale of Water-colours at Sotheby's.
7 p.m.	Entomological.
8 p.m.	Society of Arts. Cantor's Lecture VII.: Dr. Graham on "The Deer of the Future." Monday Popular Concert.
TUESDAY, March 3, 8 p.m.	Society of Arts: Consul Hutchinson on "West African Trade from Senegal to St. Paul de Loanda." Anthropological. Civil Engineers.
8.30 p.m.	Society of Biblical Archaeology: Papers on Egyptian and Assyrian Subjects, by Mr. C. W. Goolwin and Professor W. Wright. Zoological.
WEDNESDAY, Mar. 4, 7 p.m.	London Institution: Mr. Albert V. Dicey, on Agent and Principal. (Travers Course).
8 p.m.	Society of Arts: Mr. Lind on Bells and Modern Improvements for Chiming and Carillons.
"	Mr. Coenen's Second Concert. London Ballad Concert. Microscopical Society.
THURSDAY, Mar. 5, 8 p.m.	Royal Institution. Prof. Williamson (of Owens College) on Ferns and Mosses.
6 p.m.	Royal Society Club.
8 p.m.	St. Paul at the Albert Hall. Chemical. Linnean.
8.30 p.m.	Antiquaries. Royal.
FRIDAY, Mar. 6, 12.30 p.m.	Sale at Stevens's of Sir Henry Denham's Natural History Collection.
8 p.m.	Royal Institution: Sir Samuel Baker on "The Suppression of the Slave Trade of the White Nile."
"	Philological: Mr. A. J. Ellis on "Comparative Dialectal Phonology."

SCIENCE.

The Great Ice Age and its Relation to the Antiquity of Man. By James Geikie, F.R.S.E., F.G.S., of Her Majesty's Geological Survey of Scotland. (Isbister & Co.)

As in the history of man so in that of the world, the interest culminates, the scene becomes more familiar, the actors more akin to those around us as we approach our own times. Above all, the record in later ages approaches far more nearly to completeness, the breaks in the series are fewer, and we may venture to hope with greater prospect of success that careful study and inquiry will fill up the links which hitherto have escaped our researches. In geological investigation, above all, it is only by careful study of the latest formations that we may expect to trace anything like a complete history of a portion of past time, and to elicit laws which may be applied to the explanation of those more ancient periods of which but fragmentary records remain upon the earth's surface.

It is to these facts, no less than to the romantic interest attaching to that portion of the earth's history which appears, so far as our present knowledge extends, to have been contemporary with the early history, if not the origin of man, that we must refer the large share of attention which has, of late years especially, been devoted to those comparatively recent periods of time known variously as the Pleistocene, Post-pliocene, or Quaternary epoch. The researches of geologists have succeeded in eliciting, from the clays and gravels which cover, in many places, the surface of the older rocks, from the deposits in cracks and caverns in the strata, and even from the forms and surface markings of the rocks themselves, such evidence of the sequence of events which preceded the advent of civilised man and the dawn of written history, as enables a fairly trustworthy account to be given of the condition of the world in these latitudes during the epoch in question. It is now admitted by most geologists that the ages immediately preceding our own were marked in Europe, and a considerable proportion of the northern hemisphere at least, by the prevalence of intense cold, and that some of our predecessors in these countries probably existed under conditions similar to those prevailing in parts of Greenland at the present day.

But although the existence of a glacial epoch immediately preceding our own, and the presence of man on the earth during a portion at least of that epoch, are conceded by most geologists, there is much diversity of opinion as to the extent to which these islands and neighbouring parts of Europe were covered by ice, as to the part played by glaciers in fashioning the present surface, and as to what we may for convenience term the dynamics of ice. Some catastrophists hold with the late Professor Agassiz that the whole world was frozen, so that all life was destroyed and a new creation necessary; and even more moderate glacialists believe that a huge cap of ice covered all lands from the North Pole to a latitude south of the British Islands,

and refer all the features of the existing surface to the scoring and scraping of glaciers and icebergs. Between such glacialists and geologists who, like Professor Mallet and the author of *Rain and Rivers*, deny the glacial theory *in toto*, there is a wide interval; and although the author of the volume before us occupies a position intermediate between the two extremes, he attributes to the action of ice a very important part in the modification of the present surface, and credits it with powers beyond those allowed by many eminent physical geologists, perhaps by the majority. At the same time, we believe that a large proportion of the members of the Geological Survey of Great Britain hold in this matter the same views as Professor Geikie; and, as these gentlemen have had perhaps better opportunities than any other geologists for studying the question, their opinions are entitled to great respect. It must be a satisfaction to all who wish to understand the history of the glacial epoch, to have the views of those geologists who believe that the greater portion, if not the whole, of the British area was covered with ice, expressed so clearly as they are in Professor Geikie's book. The mass of details here brought together shows how great an amount of research has been devoted to the subject, and for a large proportion of the observations mentioned we are indebted to the author and his colleagues of the Geological Survey.

The ordinary process of modern scientific investigation may be briefly summarised as a careful study of one group of phenomena, of the expression in the form of hypotheses of the possible laws which have governed the origin of such phenomena, and the testing of these hypotheses by ascertaining how far they explain other cognate facts. Thus Mr. Geikie, in the volume before us, commences by giving a careful description of the formations in Scotland which have been deposited during the latest geological ages, and shows in what manner they may have been produced, and what series of geographical and meteorological changes accompanied their deposition; and having thus elicited a probable history of Scotland during the Quaternary epoch, he proceeds to show how the same theory of the succession of events will explain the deposits formed during the same epoch in Southern Britain, Ireland, the Continent of Europe, and even in North America.

The series of changes which, in Mr. Geikie's opinion, are shown to have taken place in these islands, and throughout Northern Europe and America, during Post-tertiary times, are briefly the following:—Upwards of 200,000 years ago—the date is said to be fixed by astronomical calculations—a period of intense cold commenced. The land became covered with snow and ice, glaciers flowed from all mountains and hills, and formed a great ice-sheet, covering the flat ground and extending far out to sea. So great was this sheet of ice, that the glaciers of the Cambrian and Welsh mountains swept over the lowlands of England and the floor of the Irish Sea, and met other glacial streams descending from the Scotch and Irish highlands, and even the glaciers of Scandinavia coalesced with those of Scot-

land in the shallow bed of the North Sea. After a time, however, a milder epoch commenced: the snow and ice drew back to the mountains, and the lowlands became suited for the existence of plants and animals. At first these were such forms as could exist in cold climates—pine trees, and the mammoth, the woolly rhinoceros, reindeer, musk sheep, &c.—but as the heat increased, a more varied flora formed forests inhabited by the lion, tiger, hyaena, tropical or subtropical forms of rhinoceros and elephant, &c., while hippopotami abounded in the rivers.

Again an alteration commenced in the climate, the temperature gradually grew colder, and corresponding changes took place in the fauna and flora, until once more the whole country was buried beneath a perennial ice sheet. Such alternations of cold and warm periods may have been repeated several times—how many cannot as yet be told—and they were accompanied by changes in the relative distribution of land and water owing to the alternate elevation and depression of the land, but the history of these oscillations has yet to be learned. During some of the warmer periods, perhaps during the earliest, man lived in Britain with the various animals, living and extinct, which then inhabited the country; he was a savage, using chipped stone implements, which are found buried in the cave deposits and gravels with the bones of the mammoth, hippopotamus, and cave bear.

The last comparatively warm or interglacial period commenced at a time when Britain was joined to Europe across the bed of the German Ocean, and man then entered the country together with the arctic forms of mammalia. As the heat increased, and when the more southern forms of animals had replaced those of arctic climates, a gradual subsidence took place, and the greater portion of the country was submerged until the sea stood on the mountains of Wales, 2,000 feet above its present level. Then the last cold period began, and “converted the rocky islands which then represented Britain into a frozen archipelago.” A similar change took place throughout Northern Europe and North America. The gradual retreat of the sea, accompanied by an amelioration of the climate, ushered in the present age, during the earlier portion of which, however, the British Islands were still united to each other and to the continent, and neolithic man, who had learned to smooth and polish the stone implements which he used, came back to wander in the haunts of his palaeolithic predecessors. He came with the arctic mammals, whilst the mountains were still covered with snow, and glaciers descended from their valleys; but the ice gradually melted as the temperature increased, the land became covered with forest, tenanted by herds of deer and oxen; but the elephants, rhinoceroses, and hippopotami never returned to the country, and it is doubtful if the mammoth and woolly rhinoceros reappeared after the last cold period. Later changes consisted in the separation of Ireland from Great Britain, and of the latter from the continent, and the progress of civilisation introduced the use of bronze, and finally of iron.

Incidentally Mr. Geikie treats at considerable length on theories of glacier motion; on the present aspect and condition of Greenland, a country the greater portion of which is now covered by an ice sheet similar to that which is supposed to have spread over Britain; and on the causes of cosmical changes of climate. Both for the causes of secular climatic oscillations and of glacier motion, he adopts the views of Mr. Croll, who explains the former by a combination of differences in the amount of the sun's heat received by each hemisphere in turn during changes in the excentricity of the earth's orbit, and in the obliquity of the ecliptic, together with a modification of the course taken by ocean currents; and who accounts for the motion of glaciers by a process of melting and regelation during the transmission of heat through the ice. We may remark that as regards theories of ice motion, and the action of glacier and ice sheets on the underlying surface, it does not appear to us that it matters much whether we adopt Professor Forbes's idea of plasticity, Tyndall's of fracture and regelation, or Croll's of molecular movements during the transmission of heat, the main fact of the motion of ice as a fluid remains, and we do not clearly apprehend that Mr. Croll's theory removes the two principal difficulties which have been urged by physicists against the views of Professors Ramsay and Geikie—viz. that ice is not a sufficiently perfect fluid to be able to descend over such very low slopes as it would be required to traverse in order to reach the North Sea from the Scotch and Yorkshire highlands, or the Irish Sea from the Cumberland hills, much less to arrive near the shores of Scotland from the mountains of Scandinavia; and secondly, that it could not score out such lake basins as those of Scotland and Switzerland, because the pressure necessary to move the lower portion of the glacier up hill would crush the ice, and then the upper part of the glacier would move on without carrying the lower portion forward. It appears to us that these difficulties are to a considerable extent opposed to each other: if ice form a sufficiently coherent mass to hollow out lake basins, it is far from clear how it can flow over very low slopes; and, *vice versâ*, if its fluidity enables an ice sheet to descend an almost imperceptible decline, it could not move as a sufficiently coherent body in a glacier to hollow out rock basins. But we hold that Professor Ramsay has clearly shown that there is a connection between lake basins and glacial action, and that no explanation of the origin of such basins by any other cause than ice which has hitherto been suggested explains their existence; but we do not think Mr. Geikie is any more successful than Professor Ramsay himself in explaining the *modus operandi*, and in answering the objections of the physicists; and we must confess some scepticism as to the extent of the ice sheets of the glacial epoch. The evidence of union between the ice flow from Norway and that from Scotland in especial appears to us to rest upon insufficient evidence. Moreover, whilst we are framing objections, we must add that Professor Geikie throughout does not appear to us always to give the weight to his adversaries' opinions to which

they are entitled. Some of his views are not only not universally accepted, but they are disputed by a large section of the geological world. We should be glad, too, to learn how far Mr. Croll's most ingenious theories as to secular changes in the excentricity of the earth's orbit and their effect on climate are accepted by astronomers and meteorologists, for some experience of mathematical geologists or geological mathematicians has made us very cautious about accepting their conclusions, which usually appear unanswerable until some other mathematician finds that his predecessor has mistaken assumptions for facts. We by no means assert that this is the case with Mr. Croll's theories, but they depend upon data with which geologists, as a rule, are not conversant.

These, however, are trifling objections. For knowledge and command of his subject, for skill in arrangement of his facts, and for the clearness with which he reasons out his conclusions, Mr. Geikie occupies a high place amongst scientific writers, and he has added one to the not insignificant list of geological works in the English language, which, without any sacrifice of scientific accuracy and completeness, are so clear and so free from technicalities as to be intelligible to any reader of ordinary education.

W. T. BLANFORD.

Augusti rerum a se gestarum indicem cum Græca metaphrasi edidit Theodorus Bergk.
(Leipzig: Teubner, 1873.)

SPECIFIC mention of the Will of the Emperor Augustus is made by Tacitus, Suetonius, and Dion Cassius. The Emperor and the imperial family, at the very first transmission of the empire, held, of course, a position of a mixed character, both public and private, and it was natural that their countrymen should attach peculiar solemnity and importance to the state document by which the family inheritance was made to descend from the one to the other. Augustus was anxious to make his power rest upon ancient forms and principles, and as himself a patrician by adoption into the Julian house, he took care that his Will should bear the true patrician stamp. We do not hear that it was recited according to the ancient usage at the Comitia of the Curies, a form which had perhaps fallen into entire desuetude in his time; but he provided at least that it should be deposited in the hands of the Vestal Virgins, thereby rendering it both secure and irrevocable. The Will itself was comprised in three, or, as Dion Cassius says, in four "volumes," the first of which contained his directions for his burial; the second an account of his public actions; the third a statement of the national revenues and expenses; and the last, the counsels he left to his heir, Tiberius, and to the Roman people for the conduct of state affairs. Tacitus and Suetonius seem to combine these two latter volumes in one, under the title, perhaps, of the *Breviarium*, or *Rationarium*; the second was the *Index rerum gestarum*, which we have here before us. A curious document it undoubtedly is: the more so as we possess no such autobiographical sketch of any great character of ancient, perhaps

even of modern times. The history of the document is not less curious than the document itself.

Augustus caused this Index to be engraved on two brazen pillars, or pilasters, and set up before the great building which he erected for his family mausoleum. The building itself still remains as a ruin, which has been converted into a low theatre, but the brazen pillars, as might be expected, have utterly vanished. During his lifetime Augustus had forbidden any temple or altar to be erected to his own divinity in the city, and there are but faint traces of any such worship having been actually performed within the bounds of Italy. But he was less scrupulous in allowing the weaker provincials to degrade themselves by any form of superstition they inclined to, and the Orientals rushed headlong into the deification of an Emperor whom they had never even seen. There exist at this day the remains of two temples of Augustus in Asia Minor, one at Ancyra in Galatia, another at Apollonia in Pisidia; and on both of these edifices fragments have been found of the Index, in Latin, together with a Greek translation, which admit of being pieced together and supplied one from another, till almost the whole of the original Latin text has been adequately restored.

The most important of these remains is that at Ancyra. In the vestibule of this Augusteum, the portions of wall to the right and left of the doorway which opens into the cella are found covered with the inscription in Latin, engraved in three parallel columns on each side; while on the exterior walls of the cella the Greek translation may also be deciphered, but are not so well preserved, and partly covered over by recent buildings.

The Latin exemplar purports to be the Index of Augustus, and refers to the brazen pillars of which it professes to be a copy. This remarkable relic was first discovered by Busbequius in the year 1555, and was published by Andreas Schottus in 1579. It was no doubt the remote and comparatively obscure situation of the Galatian city that preserved this copy among the many which were similarly engraved on the numerous temples erected to Augustus in the provinces. After it had been discovered, the temple was still rarely visited, and the transcripts made of it and published by later travellers succeeded one another at long intervals.

Throughout the last century the edition of Chishull was generally accepted as an adequate representation of the original. The inscription has been frequently examined since, and many emendations have been discovered or suggested. Within the last few years the late Emperor Napoleon III. commissioned MM. Perrot and Guillaume to visit the spot, and make a thorough and final recension of the Latin text. The examination of the Greek translation at Ancyra, together with the recent discovery of a second copy of the Greek at Apollonia, has enabled the present editor to give the whole document in a form as nearly approaching to the original as may now be possible. "Ac nunc demum," he justly says, "*Indicem plenum recuperavimus; nam ubi Latina penitus oblitterata sunt, velut i. 31-46, aliis-*

que locis, hæc jactura Græco exemplo compensatur; ubi Græcus titulus hiat, velut iii. 26-42, et passim, Latina fere integra servata sunt."

Undoubtedly the variation of the text thus restored from that of Chishull, even with its later emendations, as given, for instance, by Egger in his *Historiens d'Auguste*, is very considerable. The space occupied by each line of the original admitted of an ampler supplement than earlier commentators had ventured to make, but the supplement now made seems to be fairly justified throughout by the subsidiary text which has been brought under examination. It may be doubted, indeed, whether any new facts in the history of Augustus are thus brought to light; but this precious document stands revealed as the source from which our existing histories of the great Emperor have been generally compiled. It would seem that Augustus has been from the first his own historian; and with the same success which attended his career through life, has contrived to impose upon all posterity his own account of his own actions, as far as he has been pleased to disclose them. It must be said, however, that it has by no means pleased him to reveal to us the circumstances attending his most famous and most questionable exploits. He tells us nothing of his compact with Antonius and Lepidus, nothing of the proscriptions, nothing of the debates he must have had in his own mind, if not with Agrippa and Mæcenas, whether or not to restore the Republic; nothing of the reflections caused him by the defeat of Varus, on which perhaps he first became awakened to the policy of confining the Empire within the limits it had already attained. These were matters which he might wish to be forgotten, or did not care to dwell on. They would not serve the object he had in view, which was simply to give in long detail, but in the briefest and simplest terms, the catalogue of the honours he had received from his countrymen, and the things he had done for them. Such is the order in which he puts them. The Index commences with a statement of the honours he had received, the commissions imposed upon him for the defence of the commonwealth, the armies placed under his command, the civic offices repeatedly entrusted to him. That all these charges should have been laid upon him constituted his first and grandest title to the grateful remembrance of the citizens, for they constituted in themselves an irrefragable proof of the esteem in which they held him.

From thence the same document proceeds to declare the works of utility and ornament with which he improved or embellished the city. But it is only to the City that he refers. If he has conferred any similar benefits upon any of the provinces, he cares not, with one slight exception, to make mention of them. It is for the citizens only, for the Roman people, that he condescends to make these interesting statements, it is for their gratitude only that he cares. The sublime egotism or isolation of the Roman character stands conspicuous in this curious portrait of a Roman painted by one of themselves.

But long and glorious as are the lists of the honours Augustus has received from his countrymen, and the benefits he has con-

ferred upon them, it is still outstripped by that with which the document concludes, the list, namely, of his military exploits. Herein are enumerated in some sort of chronological or geographical order his reduction of the pirates, which points at Sextus Pompeius, his subjugation of the slaves, the victory of Actium, and the general consent with which the magistrates, the senate, the Italians and the western provinces, chose him as their Imperator to defend their common interests. Then follows the list of the provinces he reduced to submission, the nations to the north, to the east, and to the south, which he overcame, the standards he recovered from the Parthians, the kings he set over Armenia, the conquests he effected in Arabia and Ethiopia, the annexation of Egypt, the homage he had received from the Indians, the Scythians, and other peoples farthest of mankind, who had sought his friendship or deprecated his anger. All these matters are drawn out in great detail, though stated with singular conciseness; though every line appeals, trumpet-tongued, to the love or admiration of the Roman, not one word of self-love or self-appreciation is dropped throughout. The writer seems as cold as the very stone on which his exploits are engraved. He concludes with the simple words: "Cum scripsi hæc annum agebam septuagesimum sextum." Certainly it is a goodly array of deeds even for a space of seventy-six years.

The writer survived yet one year longer. A few lines are added to the document in the third person, and therefore presumably by another hand, adding a few further details of the temples Augustus erected, which he seems to have forgotten, or which perhaps had not been completed at the time he made his own previous enumeration. But neither does the writer of this supplement deviate in the least from the tone of stern simplicity assumed by his original. And so the strange document remains perhaps the most curious illustration we possess of the Roman character. Such were the men who raised and maintained the great empire at its highest; such were the heroes to whom at the height of their prosperity and power the Romans were content, as a nation, to surrender their rights and liberties; such were the divinities they imagined for themselves as the noblest examples of transcendent humanity, and worthy to be honoured, admired, and finally to be adored by all men less noble than themselves.

C. MERIVALE.

Aasen's Dictionary of Peasant Norwegian.
[*Norsk Ordbog af Ivar Aasen. Anden, forøgede Udgave.*] (Christiania.)

We are inclined to quarrel with the very title-page of this great work. It claims to be a Norse Dictionary, and it is nothing of the kind. We wish that the learned author had retained the title of the first edition, which appeared in 1850 as '*Ordbog over det norske Folksprog*' (Dictionary of the Peasant Language of Norway), and which rightly described the contents. There is a world of passion in the little word *Folk*! Its omission on the title-page of 1873 is a flag of defiance, and reminds the initiated reader of a long

and fierce controversy that has not yet worn itself out.

All the world knows that the same language is, and has for centuries been, in use in Denmark and Norway. Setting aside peculiarities of pronunciation and intonation, and such slight differences as must always occur when the vocabulary of a mountainous country is compared with that of a group of flat islands, there is no essential distinction between the speech and writing of an inhabitant of Christiania and that of a Copenhagener. The difference is just that between Edinburgh and London; in fact, one cannot realise the impropriety of calling the present work a '*Norsk Ordbog*' better than by imagining a glossary of Lowland provincialisms entitled '*A Dictionary of the Scotch Language*!' That the Norse provincialisms are far more marked and important does not destroy the analogy; the fact remains that no enthusiasm of pseudo-patriotism will render the uncouth and chaotic dialects of a peasantry (a dry shoot from the main stock of the Scandinavian languages) the normal tongue of a people whose educated classes have for centuries exclusively used a richer and more polished branch. Had Norway never separated from Denmark, had an unworthy jealousy of Copenhagen never crept into certain schools of thought in the sister-capital, no one would ever have dreamed of calling this folk-tongue the Norwegian language. Minor journalists may amuse themselves with such small trifling, but it is beneath the dignity of *savants*.

Far be it from us to seem to underrate the value of the work before us. Of the earlier edition one of the highest authorities possible, the late Professor P. A. Munch, said that it was a national achievement in the widest possible sense. In its present enlarged form it is more than ever a treasury of philological learning. What we appeal against is the attempt to hold out the combined dialects as the only vehicle for the thought of educated Norsemen of our own day. As a record of the past we admit to the full its value, and are thankful for it; but as a lexicon for the language of the future we hold it to be beneath contempt.

As early as 1646 an attempt was made to collect the peculiar phrases of the peasants. In that year a priest, Christen Jensen, published a little book which he called '*The Norse Dictionary or Glossary*.' Very timidly and apologetically he presents to the probable scorn of the learned world some 1,000 expressions peculiar to the southern valleys. The effort seems to have met with no encouragement; a century passed before a fresh contribution was made. In 1743 and 1745 two little local glossaries made their appearance at Stavanger and in the Ringerike district; they were of trifling value, but in 1749 the celebrated Bishop Pontoppidan printed at Bergen a '*Glossarium Norvegicum*,' which, though small, was accurate and scholarly. A learned priest, Markus Schnabel, however, was the first to dream of placing these collections at the service of the scarcely-developed science of philology. He began a careful study, which his early death, in 1780, unfortunately broke off before it had taken presentable form. The collection of words slowly proceeded: a little glossary was

printed at Copenhagen in 1802, and in 1807 Professor Schytte collected the words used in the Lofoten Islands. In this way a great deal of unarranged material took shape, and waited for a philologist to digest it. Such a man was found in Ivar Aasen, the learned compiler of this dictionary. He was born of peasant parents, in 1813, in the southern part of Romsdal, not far from the spot where, 150 years before, Jensen began the work of word-collecting. The labour of his life has been the formation of a normal language out of the best dialects of the original language of the country, and for that purpose he has travelled over the length and breadth of Norway, collecting and collating. In 1848 he brought out a grammar of the language he had created out of these mixed elements, two years later the first edition of the present work, and then a collection of proverbs given in their original colloquial form. It was on the publication of this last *brochure* that the movement we first spoke of took place: a number of young writers seized on the new language with enthusiasm; poems, pamphlets, and theological treatises were published in it, and it became the ruling affectation of the moment. Aasen himself wrote a little comedy in folk-Norse, and a collection of songs. Two young poets of some distinction, Vinje and Kristoffer Jansen, made it the sole medium of their effusions, and nothing but the sober sense of the majority prevented the total abandonment of the classic Danish. A newspaper printed entirely in the peasant tongue enjoyed great success for some years, but on the death of Vinje, its able editor, fell into disrepute. On the whole, it seems likely that the newly-discovered language will take its proper place as a scientific curiosity, and no more be heard about its serious adoption.

Aasen has been actively laborious since the publication of his first edition, which contained scarcely half so many words as this one. The general character of the language shows that it is an original offshoot from what is called the Icelandic, and that it approximates in some important points the Swedish more than the Danish branch of that stock.

EDMUND W. GOSSE.

NOTES AND NEWS.

OUR excellent contemporary *Nature* has, innocently no doubt, begun a system of exterminating the leading English naturalists, on the principle, we suppose, of "Solitudinem faciunt, pacem appellant." Every one has admired the singularly beautiful engravings of Faraday and Huxley which have been issued by the Editor during the last six months; but the effect of the last of these upon the logical mind of the *Revue Scientifique* is rather startling. In the number for February 21 we find announced

"la mort tout-à-fait inattendue et aussi douloureuse pour la science du grand naturaliste anglais Huxley, qui vient d'être enlevé subitement, tout jeune encore, au moment le plus fécond de sa carrière."

The process of reasoning by which this dolorous conclusion has been arrived at seems to have been as follows: Faraday's portrait and life appear in *Nature*: Faraday is well known to be dead. Huxley's portrait and life also appear in the same periodical: therefore Huxley is also dead. However this may be, Professor Huxley will now experience the feelings of the Emperor Charles V. in attending his own obsequies.

THE frequency of earthquakes over different parts of Central and Southern Europe, as well as in other parts of the globe, during the past year is attracting the special notice of geologists. In France earthquakes had been felt three times before in the present century, viz., in 1822, 1841, and 1846; but on none of these occasions were the shocks so numerous, or so strongly manifested, as in 1873. The phenomena were first marked in the months of July and August, in the departments of the Ardèche and the Drôme, where their focus seemed to be the immediate neighbourhood of Bourg Saint-Andéol. These early manifestations of disturbance were followed, on November 26, by an earthquake at Bagnères, which was perhaps the most remarkable of all. It began at 4 A.M., when the weather was unusually fine, and the sky cloudless and still thickly studded with stars. The second of the numerous and quickly recurring shocks was preceded by a sudden rosy light, which was rendered the more striking by the deep azure of the heavens across which it flashed. The twelfth and last shock, which took place at 10.14 A.M., caused the waters of the thermal springs to become suddenly turbid, but after the almost equally sudden rise of from one to two degrees in their temperature, they recovered their limpid clearness. Bagnères presents an unfortunate notoriety in regard to earthquakes, which date back as far as the year 580, when Gregory of Tours described the damage done in the *Caos di Gedro*. In 1660 the course of the thermal springs was completely changed by an earthquake; in 1675 the districts of Héase di San Dreus were buried under water through a similar catastrophe; and in 1750 thirty-five distinct shocks, between November 26 and 29, spread terror and devastation over the district of Bagnères.

Among the numerous earthquakes felt in Italy in the course of 1873, the one which took place on St. Peter's Day, June 29, and which was most strongly felt at Vittorio in Belluno, was the most destructive to property, and proved fatal to forty persons. Somewhat earlier in the same month the volcanic islands of the Greek Archipelago were violently shaken by earthquakes and eruptions. At Nysiros an extinct crater was reopened, and, after the emission of showers of scoriæ and cinders, was converted into a lake of boiling, brackish water, which soon evaporated, leaving the bed of the lake dry and covered with marine salt. In Algeria, as well as in South America, great magnetic disturbance was experienced in the course of last year, but no actual damage was done by the numerous earthquakes which shook the Algerine soil. On the western continent the shocks caused great apprehension by their violence and frequency, but were not specially destructive excepting at Ligua, in northern Chili, where, after thirty-three distinct shocks, occurring during the months of April, May, and June, the disturbance reached its highest point on July 8, when all the larger buildings of the city were thrown down, and a thousand persons buried in the ruins.

A FACT by no means generally known, is the tendency of domesticated plants to produce branches bearing foliage, flowers, or fruit strikingly dissimilar to that of the rest of the plant. In this way new varieties which are really valuable are obtained by horticulturists. In fact, the nectarine (which nevertheless comes true from seed) is reputed to have originated from the peach. New strains of colour in flowers are often produced—the parent strain "breaking," or "sporting," as it is called. Last year a pink Gloire de Dijon was obtained from a sport, and quite lately a russet-like apple was shown at the Horticultural Society, which had been produced by a tree of the orange pearmain. The scarlet golden pippin is known in the same way to have been a sport from the golden pippin, and not to have been a seedling.

A SPECIAL general meeting of the Linnean Society will be held on Thursday, March 5, at

8 P.M., "to consider alterations in the bye-laws of the Society." We understand that the Council of the Society has obtained legal opinion in favour of the validity of the alterations in the bye-laws recently agreed to, which has been impugned by a certain section of the Fellows.

It is understood that Mr. Bentham, the President of the Linnean Society, will not offer himself for re-election at the ensuing anniversary. Mr. Bentham has filled the chair for eleven years, and although some difference of opinion with a section of the Fellows has supplied the immediate cause for his retirement, yet, in the natural order of things, it was known that he would not long have deferred it. The transitory misunderstanding will be forgotten, and Mr. Bentham's tenure of office will come to be as memorable in the history of the Society as that of Robert Brown. The Linnean Society, as the conservator of the traditions and collections of Linnaeus, is identified with the first great reform of biological science from the systematic point of view. Robert Brown led it on to that application of morphological and developmental investigation to the purposes of systematic arrangement which is the foundation of modern biology. Under Mr. Bentham's presidency the Linnean Society has been the promulgator of the theories of the evolution of organisms elaborated by Darwin and Wallace, which to the non-Latin races have had all the importance of a new revelation. Mr. Bentham's memory as President will be perpetuated by that series of annual addresses in which an unequalled knowledge of the details and distribution of flowering plants has been used to expound on the basis of Darwinism the problems which the relations of living organisms to space and time present to us, the direction in which their solution may be sought, and the degree in which it has already been attained.

The traditions of the society require that the next President should be a zoologist. It is believed that Professor Allman has agreed to become a candidate. No one could be found personally more popular, or the whole bent of whose mind is more in accordance with the direction of modern biological science, and who would be more acceptable to the Fellows.

WE made last week a brief announcement of the grant of 100*l.* given to Professor De Bary of Strassburg by the Royal Agricultural Society for the purpose of investigating the potato disease, or rather the life-history of the fungus *Peronospora infestans*, which is the cause of it. It might be supposed from this announcement that nothing was known upon this very important subject. It will hardly be believed, that, far from this being the case, the whole story was clearly made out above thirty years ago by Montagne and others in France, and Berkeley in this country. Twenty years later De Bary investigated the subject, and added a small detail of some interest to our knowledge, and now he is begged to resume a study in which all the substantial discovery has been made by the English and French. There are still workers in this country, who, if there were anything of importance yet to be made out, would have arrived at it long since, but a belief in the German *savant* is becoming a stereotyped article of the creed of the British Philistine. Most persons would have thought it almost insulting to offer a man in Professor De Bary's position a sum of money to undertake a research which any nation might reasonably expect its scientific men to accomplish spontaneously, looking at the enormous interests which it involves. The work indeed has been done; and there are few things better understood than the *rationale* of the potato disease; unhappily few also in which knowledge lends itself less to remedial measures. Professor De Bary has accepted the money, and nothing remains but to accept the judgment of the Royal Agricultural Society and their botanical adviser that the study of cryptogamic botany is no longer possible

in this country. Indeed, the last volume of the publications of this body quite supports this belief, seeing that it carefully figures the common Bread Mould (*Ascochiza Mucedo*) under the name of the widely different *Aspergillum* (sic). Here Professor De Bary's assistance might be really invoked to some purpose.

In a paper presented to the *Kön. Gesellschaft der Wissenschaften zu Göttingen*, Dr. J. Reinke suggested a purpose in the provision of a large number of leaves with teeth, which he considers to be twofold. The first purpose is connected with the arrangement of the teeth in the leaf-bud, where their development often anticipates that of the leaf itself, their position not being in a plane with the blade of the leaf, but curled like claws on its upper side; it is probable they prevent the hermetical closing of the flower-bud, which would interfere with the free interchange of gases with the surrounding air. Their other function is that of furnishing glands for the accumulation of resin or peculiar secretions.

DR. J. NÖGERATH has been investigating the phenomena connected with phosphorescence produced by friction. At Oberstein and Idar grind-stones are made of a diameter of 5 to 5½ feet, and a thickness of 14 inches, from a very hard fine-grained sandstone, and are set in motion by a water-wheel with such rapidity that they make three revolutions in a second. The experiments on the phosphorescent phenomena were made about noon on a bright day with a temperature of about 14° R. Two kinds of phenomena were observed. Whenever a stone of about the hardness of quartz was pressed against the revolving grind-stone, a strong red light became visible between the two stones radiating in a narrow strip round the object which was being ground, and giving out a number of sparks. This phenomenon was manifested equally by all hard stones. The second phenomenon was displayed at the same time, but only by transparent and translucent stones; they were illuminated of a beautiful red colour with a touch of yellow, and presented nearly the appearance of red-hot iron. All the stones experimented on, even those which were completely opaque, became warm, though only to a moderate extent.—(*Annalen der Physik*, vol. 150, p. 325.)

We have already described (see ACADEMY, vol. ii. p. 120) the experiments carried out by Dr. McNab to determine the rate at which water is absorbed by the stems of plants, by tincturing the water with a coloured mineral solution, as a salt of lithium. Dr. Pfitzer has pointed out that these experiments indicate a rapidity far below the actual one, from the mineral salt not ascending so rapidly as the water itself. Dr. Pfitzer suggests another mode—by allowing a plant in a pot to become so flaccid from want of water that the leaves droop perceptibly, and then, after supplying the roots with water, observing the length of time that elapses before the leaves at various heights from the ground recover their normal condition. The rapidity of the ascent of the water is shown by these experiments to be much greater than that stated by Dr. McNab.

M. E. FAIVRE read before the French Academy of Sciences, on November 10, 1873, a paper detailing a series of experiments in support of the theory that the fluid which supplies the tissue of plants with food ascends beneath the bark. He found that, when strips are cut away from the bark of trees, the buds always continue to develop when a communication is still left between them and the lower part of the tree; while, if this communication is completely destroyed, the buds wither away. If a complete ring was removed beneath the bud, it withered away the more slowly the greater the distance of the strip from the bud. The starch disappeared in these cases from the portions of the wood above the cut piece and between it and the bud, while beneath the

cut it remained unchanged. If cylinders of bark are left bearing buds, they may be made to develop even into branches.

THE Anthropological Society of Paris has decided on offering a gold medal of the value of 500 fr. to the author of the best MS. on the Ethnology of the population of any one part of France; the prize will be awarded in 1876, as well as prizes of lesser value to the MSS. next in merit; the essays are to be sent in before December 31, 1875. Special attention is to be directed to the origin and anthropological characters, language, and geographical distribution of the races, and to any particular customs.

THE New York *Independent* thus describes the largest refractor in the world:—

"The great telescope of the Clarks, recently mounted at the Naval Observatory, in Washington, is probably, on the whole, the most powerful in the world. There are in existence a few reflectors of larger size. We recall at the moment the following—viz. the telescopes of Lord Rosse, one of 6 feet diameter, which is now out of use, and one 3 feet in diameter, with which some good work has been done within a few years; the 4-foot reflector of Mr. Lassell, not now in use; the great 4-foot reflector of the Melbourne Observatory, which is in use, but thus far disappoints expectation; the 40-inch silvered-glass reflector of the Marseilles Observatory, which is a good and useful instrument in its line of work; and, finally, the silvered-glass reflector of Dr. Draper, in this city, with an aperture of 28 inches. These instruments all have a larger aperture than the Washington telescope, whose diameter is 26 inches. But the latter is a refractor—i.e. it forms the image of a celestial object by means of a lens, instead of a mirror; and an instrument of this kind is generally fully a match for a much larger reflector. The only other refractor in existence which can at all compete with it is the telescope made by Cooke, of England, and belonging to Mr. Newhall, of Newcastle-on-Tyne, which has an aperture of 25 inches and a focal length of 33 feet. There are one or two other instruments in England having apertures of 20 and 21 inches; but nothing is heard from them, and they are probably of inferior quality. Next in size comes the Chicago instrument, with a diameter of 18 inches; and next to this the great refractors of Cambridge (U.S.) and Poulkova, with apertures of 15 inches. The Washington instrument, as has been said, has an aperture of 26 inches, and its focal length is 35 feet. It has a steel tube, shaped much like a cigar, and is mounted upon enormous axes of steel, upon which it turns freely with the pressure of a single finger. Its elaborate clockwork is driven by a small water-wheel, and makes it follow the diurnal motion of the stars with perfect precision. The building in which it is placed is an admirable innovation on old-fashioned observatories, being as light and thin as possible consistent with sufficient strength. The walls are made of vertical oak posts, set some eight or ten feet apart, covered on the outside with sheet iron (painted, of course), and on the inside with paper. In very hot or very cold weather an observatory with walls of brick or masonry accommodates itself to the change of temperature at night and morning so slowly that for many hours each day the instruments are rendered almost useless by the currents of heated air; but in a building of this sort there is no such difficulty. The telescope sustains perfectly all the tests to which it has been subjected, showing the highest order of excellence in its materials and workmanship. At present its principal work is in securing measures of the satellites of Uranus and Neptune, as Professor Newcomb, who is in charge of it, takes an almost fatherly interest in those planets, the investigation of whose orbits has been the most important labour of his scientific life. His recently published work on Uranus has just been crowned with the gold medal of the Royal Astronomical Society of Great Britain. No second satellite of Neptune has yet been seen, nor any satellites of Uranus, except the four observed by Lassell, and known as Ariel, Umbriel, Titania, and Oberon. These are all well seen and satisfactorily measured. Somehow or other, a report has crept into the newspapers, much to the annoyance of the observers, that the telescope shows only two of the Uranian satellites. Nothing has yet been seen of the companion of Procyon, whose discovery was announced from Poulkova, last winter, although it has been

carefully looked for. It seems to be probable, to say the least, that the Russian observers were mistaken."

Professor Young, who has just been to see it, writes to our correspondent in the most enthusiastic terms. "It is glorious," he says, "I mean the nebula of Orion seen through it."

DR. KARL E. BOCK, Professor of Pathological Anatomy at the University of Leipzig, died at Wiesbaden, on February 19, at the age of sixty-five.

THE American papers record the death last month, at Colorado, in Texas, of G. Burdon, a man who, as the inventor of the meat-biscuit, now so extensively used, and of the process of condensing milk, may be said to have done more than most persons in helping to feed the hungry and give drink to the thirsty.

PROFESSOR DOMENICO CIPOLLETTI has drawn attention, in the *Nazione*, to the coincidence of the times of appearance and disappearance of the aurora borealis, seen at Florence on the evening of February 4, and those of the grand auroral display witnessed at the same spot February 4, 1872. The aurora was also seen at Milan and other parts of northern Italy on the 4th, on which evening strong magnetic disturbance was noted at the Vienna and Munich observatories. Professor Cipolletti exhorts observers to watch with special care for any manifestations of sudden light in Jupiter's belts, which have been proved by the observations of Lassell, Proctor, and others, to exhibit the brightest colours at those periods, in which the aurora borealis was most strongly marked.

THE French Anthropological Society has recently issued a volume of *Instructions sur l'Anthropologie de l'Algérie*, by General Faïdherbe and Dr. Paul Topinard. General Faïdherbe gives the following estimate of the proportions of the various races which make up the population of Algeria: Berbers, .75; Phœnicians and Romans, .01; Vandals, .005; Arabs (maintaining themselves chiefly, but in diminishing numbers, in the E.), .15; Negroes (chiefly in the S.), .05; Jews, Turks, and European runaways, .035. Dr. Topinard's main object is to point out the anthropological and social and political distinctions between the Arabs and the Kabyles. The Arab is more artistic, imaginative, and brilliant, but he despises manual labour and lets his land run waste; the Kabyle is more solid and painstaking, and cultivates his plot of land like a garden, never adopts the Arab mode of clearing land by burning the forest, and has some rudiments of communal organisation. Dr. Topinard confirms the doubts already expressed by the *Débats* as to the wisdom of encouraging the exiles from the mountainous districts of Alsace-Lorraine to settle in Algeria.

THE veteran Dr. Rokitsansky, whose most erudite and exhaustive work on Pathological Anatomy is known to English medical readers through the translation published by the Sydenham Society, was treated on February 19, at Vienna, with a true German *Gaudeamus*, to celebrate his seventieth birthday. The learned professor, in responding to the laudatory and jubilant speeches and toasts, in which the assembled company had testified their admiration and devotion, concluded a characteristic speech by declaring that through his long career work and pleasure had ever been combined, but it was work that brought the pleasure by, and for itself. To him pleasure had often proved a heavy labour, but work had never failed to bring her own reward. A torchlight procession, with the ordinary accompaniment of deep-toned *Hochs*, concluded the proceedings of the day, which were carried on throughout in strict conformity with German precedents for festivals of this nature.

AT a recent meeting of the College of Physicians of Vienna, a paper was read by Professor Leidesdorf, detailing the success with which the once-applauded but long-despised process of the

transfusion of blood had been tried in the case of a young man of the age of twenty-three, then in the General Hospital. This patient, whose mind had been suddenly affected by unexpected pecuniary losses, had become insensible to all outward impressions, refused to take food or to speak, and in all particulars presented the ordinary symptoms of catalepsy. Electricity had been resorted to when the ordinary methods of cure failed, but without any result. It was then determined to try the transfusion of blood, and on February 3, in the presence of several medical men, three ounces of blood were injected, the direct result of which was to raise the pulse rapidly from 40 to 80 beats in the minute. A few hours later, but before any feverish reaction had manifested itself, the patient was able to speak, and to give an account of his condition during the three weeks in which he had remained speechless. Professor Leidesdorf's report was drawn up three days after the operation, when the patient's condition was satisfactory.

It seems probable, as already noticed, that while we in England are theorising on the advantages of cremation, they will be actually tested at Zürich. M. Wegmann-Ercolani, long resident in Naples, is the missionary of the movement, and has published a pamphlet of some importance on the subject. He gives the funeral customs of ancient times; shows the evil influence of our cemeteries on the health of the living; gives a detailed description of the apparatus invented by Professor Polli for burning the dead; and glances at the researches of Professor Gorini, of Lodi, who has only recently been placed in a position to carry on his experiments on a grand scale; and ends by refuting the ordinary objections to this mode of disposing of the dead. The question of the best method of disposing of the dead has also been made the subject of animated discussion in the late Medical Congress at Vienna. At a meeting of the Association, February 18, Dr. Oser, Councillor of the Imperial Board of Health, proposed that a committee should be formed for the special purpose of deliberating on the plans hitherto suggested for burning instead of burying human remains. The idea of cremation, he said, presented in his opinion greater practical difficulties than its supporters were ready to admit, and in this view of the subject he was supported by Dr. Schnitzler, who drew attention to the fact, pointed out by the distinguished physiologist Hyrtl, that in India, where the process was of frequent occurrence, the air was often poisoned for miles round after a suttee has been performed. It was resolved, however, to act upon Dr. Oser's suggestion, and to appoint a committee, which was accordingly selected from among the members present, and which, in addition to Dr. Oser himself, is to consist of the Sanitary Councillors Gauster and Novac, and Drs. Haschek and Steininger.

CAPTAIN BURTON writes to the *Pall Mall Gazette* under date Trieste, February 15:—"It may interest some of your readers to hear that an 'antediluvian cavern,' containing bones, &c., has lately been opened at Macarsca, near the southern extremity of Dalmatia. Signor Simerne Ljubich, Director of the National Museum at Zagabria, is in treaty for sundry specimens, and Dr. C. Vojnovich, after publishing his *Cenni Statistici sulla Croazia*, proposes to write, with the aid of a local antiquary, Signor Sweglevich, a memoir upon the find. These discoveries, together with the coins collected by Dr. Allacevich, will, it is hoped, illustrate the history of 'underground Dalmatia,' hitherto unexplored."

PRINCE LOUIS LUCIEN BONAPARTE's classification of the English dialects, which has been revised and corrected for the fourth part of Mr. Alex. J. Ellis's *Early English Pronunciation* (announced for publication on May 1, but unavoidably delayed by physical difficulties of preparation and printing), has been finally settled this week.

The Scotch part has been arranged by Mr. Jas. A. H. Murray, author of the well-known work on the *Dialect of the South of Scotland*. The Yorkshire varieties have been most carefully arranged and exemplified by Mr. O. Clough Robinson, author of the *Dialect of Leeds*, 1862, who has devoted twenty years of personal observation on the spot to the study of a subject for which he had exceptional personal advantages. The Derbyshire varieties have been settled and exemplified with equal care by Mr. Thomas Hallam, a native of the Peak, who has also spent many years in examining the differences and peculiarities of Derbyshire speech. The Shropshire varieties and examples are due to Miss G. F. Jackson, a native of the county, who has been occupied more than eight years with making collections for a glossary of Salop by personal intercourse with peasant speakers. Various other writers and observers have assisted in other parts. As now arranged (excluding the extinct Forth and Bargy dialect), there are four branches, Northern, Eastern, Central, and South-western, of which the first is divided into three sections: Scotch and Northern English, North-western and North Midland. These branches are divided into twelve dialects, which contain forty-one sub-dialects, and very numerous varieties. The term "dialect" is here used, to accommodate English habits of speech, for a much more minute division than is customary in applying the term to French, Italian, or Basque dialects. Taking the term in its wider and more scientific European sense, Prince Louis Lucien Bonaparte recognises only five English dialects, which he names from their central cities, although of course they are not to be found in those cities themselves, but only in the country adjacent. Referred to the above twelve dialects, these are:—

1. *Edinburgh*, containing—I. North Insular Scotch (Shetlands and Orkneys); II. Northern Scotch (Caithness to E. Forfar); III. Central Scotch (Fife, Lothian, Clydesdale, Galloway, &c.); IV. Scotch and English Border (Teviotdale, &c., and the West and East Marches, N. Cumberland, Northumberland, N. Durham); and V. Northern English (Cumberland, Westmoreland, N. and Mid Yorkshire, N. Lancashire).

2. *Leeds*, containing—VII. North Midland English (South Yorkshire clothing districts).

3. *Bolton*, containing—VI. North-western English (S. Lancashire, Cheshire, Derbyshire, Staffordshire, Shropshire).

4. *Exeter*, containing—XI. East of Parret English (Gloucester, S.W. Berkshire, N.E. and S.E. Somerset, Wiltshire, Dorsetshire, &c.); and XII. West of Parret English (W. Somerset, Devonshire, E. Cornwall).

5. *London*, containing—VIII. North-eastern (Lincolnshire, Notts, Leicestershire, and North of Warwickshire, of Northamptonshire, and of Bedfordshire); IX. Eastern (Norfolk, Suffolk, Cambridgeshire, Huntingdonshire, and N. Essex); and X. Central and Central Border (group of counties about Middlesex, and on borders of Eastern and North and South-western divisions, Kent, E. Sussex, and W. Cornwall), all considered as literary English with more or less admixture.

All these forms of speech will be examined in detail in Mr. Ellis's work, and their pronunciation exemplified by numerous examples. Those who can furnish any assistance respecting the pronunciation of English in the parts marked X. (*virâ voce* details for Monmouth, Hereford, Worcester, Oxford, and Warwick are much desired), are requested to communicate immediately with Mr. Ellis, 25 Argyll Road, Kensington, W.

THE last number of the *Journal of the German Oriental Society* contains several valuable articles. Professor Nöldeke, now at Strassburg, gives two Syriac poems on the capture of Jerusalem by Saladin; Dr. Bickel publishes the poems of *Cyrrillonas* with some other Syriac anecdotes; Dr. Blau collects the African names of flowers mentioned by Dioscorides, and traces them back to their Phœnician source, thus increasing the small

dictionary of the Phœnician language by several important additions. Dr. Boehlingk criticises Professor Aufrecht's translation of some verses from Srāṅghara's Paddhati rather severely. He points out some real blunders, but in several cases his objections are paltry. Whether in printing Sanskrit, the Vindu, the dot—not, as Dr. Boehlingk says, the Anusvāra—may be used in the middle and at the end of words is surely settled by this time, while the question whether in certain words *v* or *b* should be used, must be determined, not by the Bombay editions, but by the authority of earlier native scholars. It is quite clear, for instance, that the author of the Medini-Kosha wrote *vāshpa*, not *bāshpa*. Professor Spiegel breaks another lance for the traditional, or, as he would prefer to call it, the historico-philological method of translating the Avesta. All that can be said in general on this subject has been said. Everything now turns on the translation of single passages, where it has to be shown in each case whether a truly critical rendering, based on grammar and etymology, agrees or does not agree with the traditional translation. Sometimes it does, sometimes, as even Dr. Spiegel would admit, it does not. It is strange that Dr. Spiegel should claim Eugène Burnouf as a representative of the traditional school of interpretation. Burnouf, no doubt, fully availed himself of the tradition, but whenever there was a conflict between it and the critical and grammatical analysis of any word or passage, he never hesitated in his decision. His last appeal, and all surely depends on that, was to grammar, etymology, and common sense, not to tradition. Professor Roth avails himself of tradition far less than Burnouf did, but the true spirit of Burnouf's school lives more in him than in Spiegel. There is an important article by Dr. Zunz, who in his critical treatment of the book of Deuteronomy, the prophet Ezekiel, and the book of Esther, shows himself entirely untrammelled by tradition. There are some other articles of considerable interest by Praetorius, Steinschneider, Donner, and Sayce.

WE mentioned not long ago His Highness Rama Varma, First Prince of Travancore, as contributing a learned paper on ancient Sanskrit inscriptions to the *Indian Antiquary*. We now learn that the Zemindar Ram Dass Sen is going to publish a collection of essays on Indian antiquities, some of which have already appeared in Indian journals. The following are some of the subjects treated by this learned and liberal-minded nobleman:—India, as represented by Sanskrit authors; On the age of the poet Kāli Dāsa, Vararuchi, and Sri Harsha; On the Dramaturgy of the Hindus; On the Publication of the Vedas; On Hindu Music, vocal and instrumental, &c.

PROFESSOR THEODOR MOMMSEN, says the *Cologne Gazette*, has been chosen as successor to Professor Haupt late secretary of the Berlin Academy of Sciences; and as the King of Saxony has released him from the engagements he had entered into for accepting a chair at the University of Leipzig, the Imperial German capital will not be deprived of his eminent services.

PROFESSOR TIELE draws attention in the *Theologisch Tijdschrift* for January to a work of great importance for the history of religion, by Dr. Kern, of Leyden. The author's first object is to show that the date of Buddha's death is 388 B.C., thus making Buddhism less ancient by a century and a half than was commonly supposed. The second part of his work contains an amended text of the edicts of Asoka, the oldest and only authentic monuments of the older Buddhism. Translations into Sanskrit and Dutch are appended, with a commentary, in the course of which Dr. Kern takes occasion to contradict the received view of the character of Buddhism. Instead of being a revolt against the sacerdotal yoke of the Brahmans, it was the constant ally of absolutism. Indeed, it could not have been a "gospel of liberty to the oppressed," for the lower classes in India did not

suffer from oppression, and the persecutions of the Buddhists in India are purely imaginary. We should like to see Dr. Kern's arguments examined by some competent English scholar.

A NEW part has recently appeared of the great dictionary begun by the brothers Grimm in 1852, and continued since the death of Jacob Grimm, in 1863, by Drs. Moritz Heyne, Rudolf Hildebrand, and Karl Weigand. This colossal work was brought by J. Grimm as far as the word *Frucht*; and in the course of the ten years which have passed away since he laid down his pen, the three co-editors have only completed the letters *F* and *K*, and carried *G* and *H* as far as *Galmel* and *hitzig*. The whole of the alphabet from *L* to *Z* still remains, therefore, to be done, together with *J*, and the greater part of *Q*; and if the lexicographers who have undertaken the direction of this important work are unable to advance more rapidly with their labours, the German student can scarcely hope to see the completion of the dictionary before 1890. Like many other schemes that have their origin in Germany, the undertaking has been planned on too ponderous a scale, and designed to embrace an overwhelming mass of details which in many instances are wholly irrelevant, and simply add to the bulk of the volumes.

DRS. L. Diefenbach and Ernst Wülfker have undertaken a dictionary, to be complete in two volumes, which is to comprise High and Low German of the Middle Ages, and all words in use at the present day. The publishers, Ch. Winter and Co., of Frankfurt-on-the-Maine, announce that this work, which claims to supply the deficiencies of all former German dictionaries, not excepting Grimm's *Wörterbuch*, is already so far advanced, that its speedy appearance may be confidently expected.

MEETINGS AND LECTURES.

ROYAL GEOGRAPHICAL SOCIETY.

At the meeting on the evening of the 23rd instant the President stated that the late Prime Minister had recommended her Majesty to grant a pension of 200*l.* a year to the children of the late Dr. Livingstone. After alluding to the very slender hope which now existed that the rumoured death might prove incorrect, Sir Bartle Frere read a letter from Dean Stanley, offering, in the event of the news of Livingstone's death being true, a resting-place for his remains in Westminster Abbey.

The first paper was "Notes of a Journey in Yemen," by Dr. Charles Millengen, who has recently travelled from El-Hudaidah, on the Red Sea, to Sana'a, and returned by a new route, via Kokabān, Tawila, and the valley of the river Serdud. On his return he passed through a fertile plain, called Shibān, which abounds in cereals, clover, beans, and mustard. On adjoining cliffs the fort of Kokabān stands, 800 feet above the plain. It is strongly built, and is only to be taken from the plateau side, the other two being guarded by sheer precipices. Large reservoirs have been hewn in the rock, and as rain falls frequently the water supply is good. In 1872 this fort withstood a siege of seven months at the hands of the Turks, and the town still shows signs of the bombardment. The valley of Wadi Laa, a little farther on, is wonderfully fertile and luxurious. The next town of importance, Tawila, is a walled town with fortresses erected on huge basalt rocks above the town. The view hence southward enables one to see that most of the ridges run east and west. Rejūm, fifteen miles to the south, is situated just beyond a well cultivated plain, throughout which humped oxen are used for ploughing. Passing through Rejūm and Mahwit, they eventually returned to El-Hudaidah, having travelled through the zones of cereals and coffee on the uplands, the tropic lowlands bearing cotton and date trees, and thence to the barren shores of the Red Sea.

Captain Croft's paper on "The Exploration of the River Volta" was next read. He proceeded in December 1872 up the river with the intention of opening up trade with the Addah people. He was much pleased with the disposition of the people to trade, and arranged for a consignment of palm oil to be sent down. Captain Croft has constructed a chart of part of the course of the Volta which will doubtless prove of much value to future explorers and traders.

SOCIETY OF TELEGRAPH ENGINEERS.

LAST Wednesday Mr. Nath. J. Holmes read his second paper on electrical warfare. Like the former, it dealt chiefly in generalities, insisting on the importance of the electrical method of exploding torpedoes and mines, especially that of passing a current through fine platinum wire. The illustrations were drawn in the first paper from naval, in the second from military warfare; the American civil war and the war between France and Germany furnishing examples. Major Malcolm made some remarks on the paper, showing that the British Government had by no means neglected this means of defence; Chatham, for example, is completely surrounded by torpedoes. Herr von Fischer Treuenfeld gave some interesting information about the war in Paraguay, where river torpedoes had kept the Brazilian and allied fleets at bay for several years.

THE ROYAL SOCIETY (February 26th).

THE Papers were read:—1. The Winds of Northern India in relation to the Temperature and Vapour Constituent of the Atmosphere, by H. F. Blanford. 2. On White Lines in the Solar Spectrum, by J. B. N. Hennessey. 3. Note on Displacement of the Solar Spectrum, by the same.

SOCIETY OF ANTIQUARIES (Thursday, Feb. 12).

MR. C. D. E. FORTNUM communicated a paper, "On certain Gems in the Royal Collections at Windsor Castle," accompanied by photographs of the most important specimens, which Her Majesty the Queen, the Royal Patron of the Society, had graciously permitted to be taken in illustration of Mr. Fortnum's memoir. This Royal Collection comprises 292 objects, ranging from the best period of Graeco-Roman glyptic art, through the Byzantine to the period of the Renaissance, and to the seventeenth and eighteenth centuries of our era. Out of this number Mr. Fortnum had selected, for special observation, on the ground of artistic excellence or archaeological interest, sixteen antique gems, and fifty-two recent gems and enamelled jewels. Photographs of twenty-five of the number so selected had been taken, and wood engravings of two rings and one gem. No definite history of the collection can be referred to. It is probable that some of the choicer portrait gems, e.g. Henry the Eighth and Queen Elizabeth, have been in the royal cabinet from the period of their production, although they are not mentioned in Van der Doort's Catalogue of the objects belonging to Charles the First. A considerable accession was made to it by the purchase by George the Third of the collection formed by Consul Smith, long resident at Venice, and described in the *Dactylotheque Smithiana*. In this work, however, only three of those selected for examination by Mr. Fortnum are to be found, Mr. Smith having rather added to the number than to the value of the royal gems. Among the antique gems, Mr. Fortnum called special attention to contemporary portraits of a member of the Scipio family and of the Emperor Claudius, respectively; although the latter has by Mr. King been designated Constantius the Second. Not less interesting, at a later period, were the portraits of Henry the Eighth, Edward the Sixth, Queen Elizabeth (of which there were several examples), Philip the Second, the signet rings of Charles the First and

Charles the Second, and numerous other jewels, which it would be difficult to describe without the aid of photography.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS (Thursday).

ON Feb. 26th Dr. Leitner delivered a lecture before the Society for the Encouragement of the Fine Arts on his "Recent Discovery of Greco-Buddhistic Sculptures in Yusufzai, on the Punjab Frontier." After graphically describing the Punjab frontier districts, where the excavations were made, Dr. Leitner proceeded to show the powerful influence of Greek art among the Buddhists, and how far that influence really extended. Several of the actual sculptures, as well as numerous photographs, were circulated among the audience.

We may add that so soon as Dr. Leitner's collection is arranged for exhibition, we shall have our own opinion to express upon these interesting sculptures.

FINE ART.

KRELING'S ILLUSTRATIONS OF GOETHE'S "FAUST."

Goethe's Faust: Photographs after original Pictures, by Dr. A. von Kreling. [*Goethe's Faust*: Photographien nach Original Gemälden von Dr. A. von Kreling. (München: F. Bruckmann's Verlag.) (London: F. Bruckmann, Henrietta Street.)]

GOETHE'S *Faust* seems a never-failing source of inspiration for German art. Some of the greatest painters of Germany have tried to give us their conception of the principal scenes and leading characters of Goethe's play, and yet the new generation is not deterred. In the magnificent collection of photographs by Dr. A. von Kreling we have a new series of illustrations, which will hold its ground by the side of the works of Retzsch, Kaulbach, and Ary Scheffer. Dr. von Kreling is Director of the Royal School of Art at Nürnberg, and the compositions which are here published in photographic reproductions must have cost him many years of hard work. Among the ten pictures hitherto published there are some most elaborate compositions, as, for instance, the *Walpurgis Night*, the *Easter Morning*, the *Dream*, and the *Witches' Kitchen*. These repay a careful scrutiny both in their general arrangement and in their most minute detail. Yet though the artist may be most proud of these grander achievements, he is really greatest in his single figures. There he shows himself not only consummate in art, but as a poet not unworthy of the poet whose work he interprets. The commanding figure of Faust in his study is a great triumph; but the best of all his creations is his Gretchen. Here Dr. von Kreling has excelled both Kaulbach and Ary Scheffer. He has given us a German face in its full reality, but endowed with a depth of meaning which exercises a more powerful fascination than the most perfect ideal beauty. For unconscious innocence, Gretchen in church cannot be matched; for conscious innocence, Gretchen in the garden looking at Faust is equally perfect. Gretchen before the *Mater Dolorosa* is likewise the work of a master, but here Kaulbach carries off the palm for tragic grandeur in the prostrate form of the victim. These are the four gems of the collection, as far as it is published at present.

In spite of repeated failures, artists will persist in representing lovers embracing. It cannot be done; for though the pressing lip on lip may be less absurd than rubbing nose against nose in the Chinese fashion, the situation is incapable of objective beauty. Faust embracing Gretchen in the garden is a spirited attempt at achieving the impossible; but a scene which cannot last, and which no one cares to witness, a prudent artist should not attempt to render permanent as a work of art. One may doubt even whether such a scene as Faust's Dream is a fit subject for a picture, particularly for a picture on a small scale. Here, however, the execution is so masterly, and the beauty of the female figures so exquisite, that one forgets the somewhat crowded field of vision, and dwells with pleasure on its rich detail.

Photography has never reached a higher degree of excellence than in these illustrations of Goethe's *Faust*. The effects of light are sometimes quite startling, both as enlivening the architectural surroundings, and in giving plastic form to the human figure. The photographs are executed by the well-known firm of Bruckmann, of Munich, and published at Munich, Berlin, and London.

A. MÜLLER.

A Dictionary of Artists of the English School: Painters, Sculptors, Architects, Engravers, and Ornamentists: with Notices of their Lives and Works. By Samuel Redgrave. (Longmans, 1874.)

—Mr. Redgrave is, we think, justly entitled to appropriate Antony à Wood's honest boast that the work he has accomplished has been "a painful work, and more than difficult, wherein what toyle hath been taken, as no man thinketh, so no man believeth, but he that hath made the triall." Few, indeed, can estimate the labour that must have been expended not only in collecting the facts upon which this Biographical Dictionary is based, but also in compressing them within the narrow limits of a single volume. To the latter circumstance, no doubt, we must ascribe the absence of all reference to authorities, and of any avowal of indebtedness to the collections of others—omissions which impair in some degree the value of the book. That it is absolutely free from errors the author neither asserts nor believes, but every page bears witness to his genuine love of research, and the author's desire to make it—what we are sure it will become—a really standard work. Its scope is so comprehensive as to embrace artists of every kind and almost of every grade, and we suppose that it is through some oversight that Sir Antonio More and Sir Peter Paul Rubens—both English knights—have been excluded from a society into which Vandyke and de Loutherbourg, Vandevelde and Zuccherò have gained admittance. Mr. Redgrave will also readily acknowledge that it is not right to devote a whole page to Wyatt, who dealt worse with our churches than Cromwell, and to dismiss Bishop Waynflete with the meagre and inaccurate statement that he "was the principal builder of ecclesiastical edifices in the reign of Henry V."

This is the first work that has been written exclusively upon the artists of the English school, and has the further advantage of not being confined to painters, sculptors, and engravers, but containing the names of many of our great decorators or "ornamentists." Hence the carvings of Grinling Gibbons and the furniture of Chippendale here find a place, and the names of many of the decorators of porcelain are recorded. But in these points the work is susceptible of great enlargement. Of the ubiquitous china-painter Billingsley, Mr. Redgrave mentions only his sojourn at Derby, unmindful of his migrations to Pinxton,

Torksey, Worcester, Nantgarw, and Coalport. Bone, the enameller, never worked, as he states, with Cookworthy, but was apprenticed to Champion at Bristol, where he executed some of his finest works. Derby furnishes an important list of artists: Spangler, the modeller in biscuit; Pegg McQueher, Bowman, Brewer, and a host of others. The vases of Donaldson of Worcester are more prized than his works on canvas; and Pennington, Aske, and Davis may be added to the Worcester artists Mr. Redgrave has already named. In a new edition we hope to see the list greatly increased, and the work thereby made even more valuable than it is already.

Antique Point and Honiton Lace. By Mrs. Treadwin. (London: Ward, Lock, and Tyler.) Mrs. Treadwin's practical little book on the art of lacemaking is opportunely published at a season when lace forms one of the objects for the International Exhibition. No one could be better qualified for the task, from her own personal experience and intimate knowledge of the subject, and what she knows, she freely imparts. Her directions are so clear that all who run may read, and her instructions are accompanied by woodcuts, thus teaching also by the eye, often a more powerful medium than description.

The first part of the work shows how to reproduce antique laces, Rose and Venetian and other points, of which the typical stitch is the button-hole stitch. An excellent engraving of Rose point accompanies this division of the book. The second part is devoted to Honiton lace, in the making of which, as a Devonshire manufacturer, Mrs. Treadwin is well versed. We heartily recommend her volume to all who desire clear instruction in the art of lace-making.

NOTES AND NEWS.

PAINTING, like literature, has been an ill-paid profession until modern times. Holbein's salary as serjeant-painter to Henry VIII. amounted to no more than 30*l.* a year, and a century later Vandyke's ordinary charge for a portrait was only 40*l.* Evelyn tells us that at Lord Melford's sale, in 1693, a Rubens sold for 20*l.*, and "the picture of the Boys, by Morillio the Spaniard," for 80 guineas—"deare enough," adds the diarist, who elsewhere complains that "our English paynters, greedy of getting present money for their works, seldom arrive to any farther excellency in the art than face-painting, and have no skill in perspective, symetry, the principles of designe, or dare undertake to paint history."

THE Austrian Education Department is making arrangements for the establishment of several free schools of art. Already one evening school for instruction in drawing has been opened in the building of the Ober-realschule.

THE citizens of Genoa have this year been enriched by the munificent gift of the Palace Brignole, which, together with its valuable library and picture gallery, and a row of adjacent houses, bringing in an annual rental of 50,000 lire, has been presented to the city in perpetuity, by the Duchess della Galliera, whose husband, while he confirms the presentation and its avowed object of promoting the cause of art and science, has added to it a donation of two million lire, in aid of destitute families.

IN the last number of the *Archæological Journal* Mr. J. J. Rogers records the discovery of some Romano-British, or late Celtic, remains made at Trehan Bahow, St. Keverne, Cornwall, about forty years ago, but not published until now. These remains were found in some graves in a field called the Bahow, situated near the southern margin of the Goonhilly Down. Each grave was formed of six stones set on edge, two at each side and one at each end, besides the covering stone. They were placed nearly east and west. A bronze mirror, excellently preserved,

several beads of vitreous substance, some gilded rings, parts of fibulae, and other bronze ornaments, all apparently objects of personal decoration, were found in one of these graves. The others appear to have been empty. The bronze mirror, of which a drawing is given in the journal, is an object of great rarity, only five others of like kind having been discovered, four in England and one in Scotland. They are considered by Mr. Albert Way, Mr. Franks, and other authorities to be of late Celtic workmanship. This mirror and the other relics found at Trehan have been placed in the British Museum.

THE *Times*, in an obituary of Mr. John Pye, who died on the 6th instant, at the age of ninety-two, sums up his place in art by saying that "he deserves the name of 'Father of Landscape Engraving,' as the first English engraver who fully apprehended, not to say carried out, the engraver's task of producing in black and white all the gradations that express space and suggest colour." The *Times* states that he has left a mass of interesting notes on the artists of his time, in particular on Turner, which, it is to be hoped, will see the light. And we may add that a magnificent copy of *Liber Studiorum*, which Pye had received from Turner, has been for the last six or seven years in the possession of the British Museum, which acquired it by purchase. Mr. Pye left a valuable collection of engravings, and was occupied not long before his death in cataloguing them.

THE *Spenerische Zeitung* announces that the Genevan authorities have determined to restore to the reigning Duke of Brunswick all the art treasures bequeathed to the city by his late eccentric brother, "the Diamond Duke." This valuable collection, great part of which had been abstracted by the ex-Duke from the ducal museum at Brunswick, includes the celebrated onyx, nearly lost through the prince's expedient of concealing it under a coating of gold, and the equally famous gem which once formed part of Mary Stuart's signet-ring.

THE *Wiener Zeitung* announces that Cavaliere Salazarro has left Naples to take the chief direction of the explorations which are to be carried on at Paestum and at Velia, now known as Castellammare. As neither of these localities has been examined with any care, although some of the most interesting mural paintings in the Museum at Naples have been obtained from Paestum, we may anticipate valuable results from these projected undertakings. The new interest in art that is awakening in Italy is shown by the recent foundation of art-museums at Capua and Salerno, where the expenses of these institutions are to be sustained by the local provincial government. The Cavaliere Salazarro is the author of *Studi sui Monumenti dell'Italia Meridionale dal IV. al XIII. Secolo*, a work which has been most favourably received by the best art critics of Italy; and as he has set himself the task of proving, in contradiction to Vasari's opinion, first, that the arts and sciences never wholly died out in Southern Italy; and secondly, that their revival was not due to Tuscan influences, we may feel assured of the zeal with which he will prosecute his labours at Paestum.

A SALE of works of art has been organised by a number of French artists for the benefit of the statuaty Fromanger, who has become blind of late years. The sale will take place in March, and some of the greatest artists of France have promised to contribute to it. Any foreign artists who may be willing to aid in this generous work are requested to send in their adhesion as soon as possible, either to the auctioneers, MM. Escribe and Ptit, or to M. Durand-Ruel, with whom the works for sale will be deposited.

THE *Cologne Gazette* of February 23 gives publicity to a notice that has appeared at Berlin, announcing that an exhibition will be held in the Royal Academy of that city, between March 20

and April 12, of drawings, studies, casts and models, adapted for use in schools of every class and kind, from Kindergartens to Polytechnics. As this exhibition is specially intended for the farther development of the theoretical and practical departments of the art of teaching drawing, painting, and modelling, it is intended that lectures in connection with the branches of instruction shall be daily delivered by competent persons during the continuance of the exhibition.

THE Report of Mr. C. F. Adams, of which a summary appears in the *Nation*, explains the failure of the United States at the Vienna Exhibition. Gentlemen were sent to Vienna as Commissioners apparently for no other reason than because they desired to see the Exhibition, and some of the American jurors were as ignorant of German as of the merits of the wares exhibited. There seems to have been a great want of organisation; and the objects exhibited cannot be said to have fairly represented the productions of the country. For instance, in the group of National Domestic Industry, the only American contributors were two young ladies, who sent "an embroidered picture" and "a phantom bouquet." In the group of Art applied to Religion, America contributed only a "bronze lectern" and an "improved burial casket."

At the Hôtel Drouot, on the 18th instant, some important pictures were sold. The following prices were realised:—*Vue des côtes de Hollande*, par Backhuysen, 950 fr.; *le Porte-étendard*, par F. Bol, 830 fr.; *Pays montagneux traversé par une route*, par J. Both, 1,760 fr.; *Vue de Venise*, par A. Canaletti, 880 fr.; *Vue du Grand Canal*, par le même, 950 fr.; *Portrait de Wilhelm van den Velde*, par Albert Cuyp, 1,100 fr.; *Réunion galante*, par Karel du Jardin, 870 fr.; *Paysage et animaux*, par Jan van Goyen, 1,000 fr.; *Tête de jeune fille*, par Greuze, 2,350 fr.; *le Petit Boudeur*, par le même, 2,320 fr.; *Ports de mer Italiens avec ruines*, deux pendans, par Guarde, 700 fr.; *Canal de Hollande*, par J. van der Heyden, 5,000 fr.; *Bassecour*, par Hondeloeter, 960 fr.; *Groupe de mendiants au repos au bord d'une rivière*, par Lingelbach, 1,540 fr.; *Tabagie*, par J. van Ostade, 1,180 fr.; *Scène pastorale: la Danse*, par Pater, 2,000 fr.; *la Nativité*, par Platzer, 4,680 fr.; *Descente de Croix*, par le même, 4,900 fr.; *Madone*, par Sasso Ferrato, 900 fr.; *Intérieur de Cabaret*, par J. Steen, 1,245 fr.; *Intérieur flamand*, par D. Teniers, 2,850 fr.; *Un autre Intérieur*, par le même, 1,340 fr.; *la Vierge et l'Enfant Jésus*, par Tiepolo, 900 fr.; *Sainte-Famille*, par Le Titien, 670 fr.

AN interesting discovery has been made by M. Montier-Huet, at Mesnil-sous-Lillebonne. Besides two vases of Samos ware, and two vases of thick green glass, bulb-shaped, there was found in a broken cinerary urn a Roman pipe, of white clay, precisely like our modern pipe, and apparently unused. The fact will doubtless be made the most of by scholars who maintain that tobacco and its uses were known to the ancients.

M. FRÉMYER's statue of Jeanne d'Arc, in the Place de Rivoli, was unveiled on the 21st instant, but the critics are by no means unanimous in its favour. The Maid is represented on horseback, holding the oriflamme in her right hand, and her head is surrounded by a gold crown.

COMPETITION, open to French and foreign architects, has been invited by the Cardinal-Archbishop of Paris for plans for a new church, to be dedicated to the Sacred Heart. The plans are to be deposited before June 30 with the Archbishop, and to be accompanied by an estimate according to Paris prices, the total cost not to exceed 7,000,000 francs. The building is to include a crypt, the church proper, several sacristies, and a residence for the sacristan. Three prizes will be given, of 12,000, 8,000, and 5,000 francs respectively; and seven sums of 1,500 francs will be awarded to unsuccessful architects as a compensation.

In the recent Budget debate in the Prussian

House of Deputies, the proposed grant for the Berlin Academy of Arts was made the occasion of warmly criticising its organisation. The Government promised to lay a scheme of reorganisation before the House next session, and, subject to this condition, the amount asked for was granted. A warm debate likewise arose on the vote of supply being taken for the Royal Library at Berlin, and the administration was severely taken to task. Reform being promised in this case also, the vote passed.

THE *Chronique*, quoting from a volume which has lately been printed in Florence, containing important documents concerning the art treasures of that city, gives some interesting particulars relating to the number of paintings in the different galleries in Florence and the masters represented. The total number of paintings on canvas and panel in the Uffizj, the Palazzo Pitti, the Museum of San Marco, and other public buildings, not including the Academy, amounts to 3,345: among these there are 19 attributed to Raphael, 26 to Andrea del Sarto, 34 to Titian, 27 to Bronzino, 25 to Paolo Veronese, 12 to Sandro Botticelli, 10 to Palma Vecchio, 12 to Fra Bartolommeo, 18 to Tintoretto, 45 to Fra Angelico. Teutonic art, as one might suppose, is not largely represented, but there are 125 works of the Flemish school, and 36 of the German, among which we find no fewer than 8 portraits bearing the name of Albrecht Dürer. Only two of these however are genuine. One is the well-known profile portrait of himself when a young man; it forms part of the celebrated collection of artists' portraits painted by themselves; and the other is one of the four repetitions of the portrait of "Albrecht Dürer der ältere." Of the French school there are 30 paintings, 27 of them being by Clouet. The Spanish school only numbers 8. The collection of drawings by the old masters at the Uffizj is especially rich. A catalogue was published in 1870 containing as many as 32,471 numbers.

The volume from which these particulars are taken was compiled a short time since by the administrators of the various galleries, and published, apparently, for their own benefit, for very few copies have found their way into general circulation.

A VERY interesting book, entitled *Notes on Japanese Art*, by G. A. Audsley, has been printed for private circulation. From his paper, read before the Architectural Association of London, it is clear that Mr. Audsley is an enthusiastic and appreciative student of Japanese Art, on which he dwells in glowing terms. He speaks highly of the skill of Japanese artists in most respects, and remarks that "it seems strange that so much could be told by half a dozen up and down brush strokes as is plainly told in the simplest Japanese sketch." He gives separate dissertations on the various branches of Japanese Art, including Enamels, Porcelain, Lacquer Work, &c., all of which are extremely interesting; and, further, he does the public a real service by warning them that enamels, of evidently modern manufacture, have recently been imported into this country to meet the growing demand for the ancient article. Mr. Audsley's book includes a "Catalogue Raisonné of the Oriental Exhibition of the Liverpool Art Club," which was held rather more than a year ago. No fewer than 1,101 objects of Oriental Art were thus exhibited, all of which are separately catalogued, with a short descriptive notice. About a quarter of the entire exhibition consisted of enamels, most of which were from the unrivalled collection of Mr. J. L. Bowes. We may mention that the Catalogue is accompanied by upwards of twenty very beautiful photographs. It is perhaps hardly necessary to state that the Liverpool Art Club was established in the autumn of 1872 on the plan of the Burlington Fine Art Club.

THE collection of M. Viardot, consisting of *bric-à-brac* of the time of Louis XIV., three hundred and fifty terra-cottas from tombs in South

Italy, and some very rare and curious urns in polychrome, with figures in relief, was sold on Wednesday, the 11th inst., at the Hôtel Drouot.

THE colossal statue of the Assyrio-Phœnician Hercules discovered some time ago near the town of Amathus or Cyprus has been sent by steamer to Constantinople. The statue is perforated, and was originally intended as a fountain, the lion's head having served as the spout.

FOUR women are decorated with the Order of the Légion d'honneur, in France. They are,—M^{me}. Rosa Bonheur, the painter; M^{me}. Dubar, Lady Superior of the *Sœurs de l'Espérance*, at Nancy; M^{lle}. Berthe Rocher, of Havre, who has founded hospitals and charitable institutions; and Lady Pigott, who devoted herself to the service of the wounded by the war.

THE STAGE.

"MARY QUEEN OF SCOTS," AT THE PRINCESS'S THEATRE.

THE Princess's Theatre has long had almost a monopoly of the historic drama, although the Queen's and the Lyceum have made occasional efforts to compete with it. It has been chosen as the scene of the last effort of Mr. Wills.

The fortunes of Marie Stuart have afforded both the novelist and dramatist many an opportunity for enlisting on her behalf the sympathies of the public. Schiller has seized upon the closing days of her life, and has produced an effect rarely surpassed by his portrayal of the untiring animosity of her enemies, and the dignity with which she bore her sufferings and submitted to her fate. Mr. Wills also seeks to enlist the general sympathy with the unfortunate queen, but he very wisely declines to challenge comparison with the great German poet; he chooses a totally different episode in her career. Holyrood—and not Fotheringhay—is the scene of the play which was produced on Monday night, and the love of Chastelard and the bigotry of John Knox are the features of the piece.

Mr. Wills is always a cultivated writer, and the speeches placed in the mouths of his characters are more carefully thought out than those of the majority of modern dramatists. Nevertheless the present play, even without reference to the acting, is the reverse of successful. That the events he narrates, and the characters he delineates, are historically inaccurate, is an offence easily pardoned in a dramatic author; but it is a much graver fault for the piece to be dull and uninteresting. Throughout the whole of the five acts the audience did not seem able to interest themselves in the fortunes of any one of the *dramatis personæ*, though an audience who cheered the "supers" who removed the furniture can hardly be supposed to have been phlegmatic.

The first act exhibits Marie Stuart in the early days of her widowhood, enjoying herself at Fontainebleau in the congenial society of the French Court, and here she receives her summons to Scotland. In the second act she makes a triumphal entry into Edinburgh. The scene of the three last acts is in the Palace of Holyrood, and the plot (if the drama can be said to have a plot) turns upon the enmity felt by the Scotch Presbyterians, headed by John Knox and Lord James Murray, for the French favourites of the Queen.

The appearance and the many costumes of Mrs. Rousby may in some degree remind us of Mr. Wills's heroine, but in no other respect does the actress at all realise the part. Mrs. Rousby is beautiful and picturesque undoubtedly, but she gives us no idea of those manners (formed in the French Court) which so astonished her gloomy Scottish subjects, nor of the remarkable fascination which lured Chastelard, Bothwell, Darnley, Douglas, and their many rivals, to ruin and death. The author has given her more than one opportunity of making an effective point. Of not one does she take advantage. The farewell to France in the first scene is couched in well-chosen and

almost touching language, but it is delivered in a querulous and monotonous drawl. The command to John Knox to "stand back and let the Queen of Scotland pass," in the second act, requires physical power as well as elocution. Neither is forthcoming. The soliloquy in the last scene, when Chastelard is dragged away to execution, is evidently intended to produce the chief effect of the play. It is murmured in so low a tone as to be almost inaudible and quite unintelligible. Mrs. Rousby is rather more successful in the scenes in which the Queen tries the influence of her charms upon John Knox, and she possesses a softness and refinement of manner which would be pleasing in the representation of a different class of character. She first obtained popularity in London by appearing as Marie Stuart's great rival Queen Elizabeth in *Twist Aye and Crown*, and she does not seem to recognise much difference in the characteristics of these personages. If the Marie Stuart is weak, the Chastelard is worse than weak. Instead of the chivalrous and graceful French poet with the musical voice, Mr. Charles Harcourt presents us with a somewhat ungainly and obtrusive courtier, vigorous indeed, but thoroughly English. Mr. Rousby plays John Knox not inartistically, but not forcibly. We miss the marked individuality of the Reformer. The actor gives, perhaps unconsciously, much force to the humorous side of his part. Some players might have represented Knox as a dignified divine; more would have portrayed him as a repulsive fanatic; but few would have conceived the idea of extracting humour from the part of the Calvinist. The parts of Murray and Rizzio call for little comment, having little to do; but both of the actors, and especially Mr. Darley, deserve a better chance another day. Mr. Calhaem plays the small part of the Provost exceedingly well. Perhaps he is a Scotchman himself. If not, he has mastered both the accent and manner of broad Scotchmen more thoroughly than any one else in the piece. The piece is not worthy of more lengthened criticism. It is a pity that a writer of Mr. Wills's ability should be unable to take up an historical subject with greater success. In *Mary Queen of Scots* his dealing with a controversial question is only harmless by reason of its insignificance. ISAAC BRISTOW.

"ELDORADO."

THE new piece at the Strand is called a "musical folly," which means in this case a musical farce. It is derived from a farce into which music did not enter—a Palais Royal piece, named *La Cagnotte*, in which, we believe, M. Ravel was once distinguished. English farces have of late years been generally somewhat dull—or rather, we suspect, they were always somewhat dull, but that it took us all some time to discover the fact. Besides, sixty years ago our stage jokes were very simple. We laughed heartily where we could now only yawn. The finish of our wit has increased with our melancholy; and now, if we are to laugh much at any farce, it seems almost necessary that it shall come to us from over-sea. That, at all events, is one of the recommendations of *Eldorado*, which Mr. Farnie, the author of *Nemesis*, has just now fashioned, and which the Strand management has placed upon the boards after two hundred and fifty nights' performance of Mr. Farnie's earlier work. There is something rather new about the idea of *Nemesis* and *Eldorado*, for neither is distinctly a farce, and neither attempts to be an ordinary burlesque. The burlesque here is of real life, instead of some familiar story. No well-known novel, opera, or play is parodied in this, and the fun is wrung out of the exaggeration of one comic fancy, and here it is the fancy of some honest villagers travelling to Paris under the escort of their mayor, and finding Paris a very different place from what they had expected.

Of course they are full of the sense of their own importance. Though they do not know Paris, they find it difficult to believe that Paris

does not know them. The mayor is actually unable to make answer when a citizen of the capital boldly enquires "Who are you?" This is naturally too much for the local magnate, and one is fearful of the consequences. But the mayor having been in Paris with his mother when he was three months old, reckons on the acquaintance with the city which he made then to be still of infinite service to him, and his villagers are constantly entreated to have confidence in their mayor—"I have known Paris from my cradle." The happy party go to that frugal restaurant, the "Trois Frères," and object to pay its bill, and so get into a police station and all sorts of trouble, into which we scarcely need to follow them. The fun, though exceedingly light, is genuine and successful. That is to say, a vein of real humour runs through all the extravagance: at least at first. We take exception to the later scenes with the matrimonial agent, to whom the villagers resort; for here, it seems to us, Mr. Farnie has missed his opportunity. Here was a field of fun not wholly unworthy of the authors of *Tricocoe et Cacolet*, and Mr. Farnie has strangely omitted to use it to the full.

And it is chiefly in consequence of this neglect to use a good opportunity that Miss Claude—who counted for so much in *Nemesis*—has here a part which is disappointing. Out of the materials the author has given her she cannot make very much of the matrimonial agent. Miss Nellie Bromley—as the village belle—is decidedly better off. She has the good taste not to over-dress the part, and she acts it with her usual mischievous humour, the varied expressions of which are now evidently popular. M. Marius succeeds in giving great reality to his character of an *officier de paix*. Mr. Edward Terry is an all-important Mayor, whose political allusions are received with much approval; and two other local celebrities, of the village of Fouilly-les-Oies, are personated very funnily by Messrs. Odell and H. Cox. Many other performers take part in the piece, and the business is bustling from end to end. The scenery is the right thing of its kind, and there is much *verve* in the music. For a light piece, it is a good piece; so that not only author and actors, but Mrs. Swanborough and Mr. Stephenson, who have superintended its production, are to be congratulated on a success which will amuse their public, not unworthily, for many a merry night.

SOME ACTING AT THE HAYMARKET.

A SECOND visit to the Haymarket Theatre during the performance of Mr. Gilbert's *Charity* suggests a remark or two on certain points in the acting of this piece, which we wrote upon at considerable length in the ACADEMY of January 10, but of which the rendering is so uncommonly good as to justify further comment. And if this comment takes in part the form of fault-finding, that is only because the indication of minute faults is sometimes the highest praise which careful criticism can bestow upon careful art. Of Mrs. Mellon's vigorous and strongly marked performance, there does not seem to be much that is fresh to say; though there is one touch that we feel to be jarring—unpleasant in itself, and scarcely consistent with the reformation of mind as well as conduct, supposed to be effected in Ruth Tredgett, the tramp—and that is, the hard and sneering tone with which the woman leaves Smailey's presence, throwing at him, with too much at once of mocking laughter and of bitter hate, the assurance that this time the "promise" shall be *hers*; not his. Nor does it occur to us that there is need either to amplify or correct our original comments upon the acting of the men, who maintain a high level throughout, but have no opportunity for special distinction.

With the two ladies not yet mentioned the case is different. Not only is Miss Robertson the leading actress of the day, but her performance in this comedy—had it been her first—would alone well-nigh

have sufficed to make her so. A very thoughtful critic said of her that, at the end of the third act of *Charity*, she "almost reached inspiration," and we ourselves, using other words, meant nearly the same thing. But that was in speaking of her achievement of the first and second nights. While the climax of the third act was still led up to with great discretion and ability, that climax itself, when we saw it last week, was not given with quite the early power and impulse. It is no doubt of the utmost difficulty to retain, when time and repetitions have worn down, so to say, the keen edge of a dramatic situation, that full emotional expression which the high excitement of a rare moment suggested and revealed. To do so is the last achievement—but it is also, in one sense, the most necessary—of a genuine theatrical artist. Broad, powerful, sympathetic, Miss Robertson's performance is, throughout; but we miss at the end of the third act, at the moment of the frantic appeal, just that thickness of utterance, that voice absolutely clogged with trouble, passion, abandonment, which made the witnesses of the earlier performances feel themselves in presence less even of an accomplished actress than of an overwhelming personal tribulation. This, then, is a point in which Miss Robertson at present falls short, one may be sure, of her own ideal; there remains to speak of a point in which she certainly does not reach the ideal of any keen and delicate observer, because her play at this point is fit only for the admiration of those upon whom delicacy and *finesse* would assuredly be lost. Very near the end of the second act Mrs. Van Brugh listens, with gathering anxiety, to the reading of the will. For her, everything depends upon the name that is given to her in that testament. Her associates do not know this, and accordingly the dumb-show with which Miss Robertson illustrates her anxiety and suspense is wholly unnatural and improbable: true enough, no doubt, to theatrical traditions as to conduct at such crises, but in fact substituting for a keen study from nature and the life, the mere stage-symbols of emotion. If Miss Robertson were really incapable of expressing herself by slight and sudden facial changes, she would not be the actress that she has often proved herself; but at the same time, judged by a lower standard, she would have more excuse for this long conventional presentment of an anxiety, the signs of which in actual life would be repressed so sternly that none but the slightest and most involuntary could appear at all. Miss Robertson can express so much with so light a touch, that we are bound to judge her by the higher standard, and to claim from her such a subdued sign of excitement as appeals chiefly to the playgoer whose observation of men and women is not confined to the theatre, instead of this long-drawn and too obvious pantomime which is only quite successful with the playgoer who does not trouble himself to compare what he sees before the foot-lights with what he sees outside the theatre door. And, these corrections made, what is now an admirable performance would become, we think, almost an unexceptionable one.

In like manner Miss Amy Roselle has but one or two things to do to make her rendering of Mrs. Van Brugh's confiding daughter, Eve, as perfect as the author's treatment of the character will allow it to be. He has made her very pleasant, but not distinctive or original, and yet Miss Roselle manages to make her thoroughly natural and individual, perhaps because the actress, while possessing all the intelligence and sensitiveness needed to understand and enter into the type that is intended, is careful never to aim at a greater effect than the effect actually required: so that from beginning to end—save, we think, at one moment which we speak of immediately—there is presented a thoroughly daughterly figure, with daughterly ways, graceful, confiding, and subdued. Early in the piece she tells her worthless lover that she is but a silly and simple little girl, and

tells it (so say those who are by no means inappreciative of the general excellence and fine taste of her performance) just as if she expected to be instantly contradicted; that is, with a momentary absence of the simplicity elsewhere so notable. Failing here, Miss Roselle fails in an expression of which Miss Robertson would perhaps be a complete mistress—may, an expression the completeness of which did give to Galatea almost that which was most unique in its excellence. But Miss Robertson's well-known air of girlish *naïveté* is not only unlike the brief failure in simplicity which we are pointing out to the careful observers of Miss Roselle's acting: it is also unlike the actual and very pleasant simplicity which Miss Roselle maintains through nearly the whole of her performance: this *naïveté* of Galatea's (and her representative's) having nothing whatever to do with limitations of place, station, or epoch. It is an elemental expression of Human Nature, and might have been seen in Greece at the beginning of its civilisation, or in Prospero's island, or in Eden before there was the least suspicion of the apple. It has so entirely passed out of our actual experience that the presentment of it was felt by many who beheld Galatea to be even more pathetic than charming. Now Miss Roselle's simplicity—one good quality of hers, as an artist, out of many now getting to be recognised—is distinctly English, and English of the nineteenth century; and it is the simplicity of good breeding, as distinguished from that with which breeding has nothing to do. There is along with it a certain acquired grace—not even Sir Joshua's; but that which is supposed to be of modern drawing-rooms. It is a simplicity *doublé* with culture and the material refinements of modern life. And the contrast is worth remarking. FREDERICK WEDMORE.

At the Gaiety Theatre on Tuesday evening a new "extravagant comedy," called *Too Clever By Half*, was played for the first time. It has been adapted from the French by Mr. Oxenford and Mr. Joseph Hatton. The principal parts are taken by Mr. Toole and Miss Farren, whose acting has been recently criticised at some length in these columns.

WE are told that on Easter Monday a new play by Miss Braddon will be brought out at the Alexandra Theatre, Liverpool. It will be called *The Missing Witness*, and the chief parts will be acted by Mr. Saker (the lessee), and Miss Marie O'Beirne, who until very lately was at the Court Theatre in Sloane Square.

FOR some days past the advertisements in the daily papers have been telling us that "a brilliant actress and popular favourite" would shortly return to the stage, and appear at the Queen's Theatre. Our readers will learn with pleasure that this is no other than Miss Ellen Terry (Mrs. G. F. Watts), who will make her *réentrée* this evening as the heroine of *The Wandering Heir*.

WE were wrong last week, or rather we were premature, in regretting that no actor of the capital Vaudeville company was to play in *The School for Scandal*, at Drury Lane, for Mr. Benjamin Webster's benefit, next Monday. Mr. Horace Wigan, Mr. James, and Mr. Thorne, will appear in it, though not in the parts they were accustomed to fill at the Vaudeville. The "friendly demonstration" will be, we are glad to see, one of almost unequalled importance, and is to be regarded not merely as a tribute to Mr. Webster as a man and as an artist, but, we are sure, as a recognition of the long and hearty interest he has taken in the general prosperity and advance of his profession.

COVENT GARDEN THEATRE closes to-night, with a performance of *Rip Van Winkle* and the pantomime.

MR. GILBERT is engaged upon a play for the Prince of Wales's Theatre, but it is not likely to

be produced for a long time to come; for, though the last nights of *School* are now announced, old legitimate comedy is to come between Robertson's play and Mr. Gilbert's. The Prince of Wales's management informs the public that during the nearly one hundred years that have elapsed since the production of *The School for Scandal*, "the tastes and requirements of audiences have considerably changed," and that therefore the management feels assured of not being charged with disrespect "for attempting to heighten the effect of the work by an unexampled attention to the costumes, scenery and general appointments," and by "a few transpositions in the sequence of scenes made with every regard for the integrity of the text." So long as the scenery does not overpower the acting, no one can take exception to the "unexampled attention" which it is proposed to bestow upon it. But as regards "the transpositions in the sequence of scenes," that is a very different matter—a change likely, one would surmise, to be more of a novelty than of an improvement. It is popularly supposed that when Sheridan wrote and arranged a comedy, he knew tolerably well what he was about.

At the Théâtre des Variétés, MM. Meilhac and Halévy have produced their *Petite Marquise—Les Merveilleuses* of Sardou having been withdrawn. The *Petite Marquise* is on an old subject, treated in a lively way. The authors know very well their public of the Variétés, and so does Madame Chaumont, who plays the principal part.

L'Aveu is the title of a new piece, at the Théâtre de Cluny; and in the piece M. Georges Petit seems to show some excellent aptitude and not a little want of experience. It is objected that the first portion of his work is not even a prologue, properly understood, but is a *hors d'œuvre*, and rather too serious a one.

At the Folies Dramatiques an unprecedented thing has happened. A piece—it is of course *La Fille de Madame Angot*—has been played for more than three hundred and sixty-five consecutive nights. A London theatre has been able to more than match this in number of nights; but then, unlike the Parisians, we do not act on Sundays.

A WEEK ago Mademoiselle Desclée's life was despaired of. Since then she has been very slightly better; but not, it is feared, permanently.

MUSIC.

MR. COENEN'S "CHAMBER CONCERTS OF MODERN MUSIC."

THE first of a series of three most interesting concerts under the above title was given at Hanover Square Rooms yesterday week, by Mr. William Coenen. Though of late years there has been comparatively little cause for complaint as to the non-appearance of novelties in our programmes—and such concerts as those at the Crystal Palace for orchestral music, and the Monday Popular Concerts (as well as the excellent performances given by Mr. Henry Holmes, Mr. Ridley Prentice, and others) for chamber music, have done much to diffuse among our English musical public some degree of acquaintance with the leading composers of the modern school—there have, we believe, been no concerts, with the exception of Mr. Coenen's, devoted exclusively to the production of novelties or quasi-novelties. That such programmes as those he provides would be "popular" in the ordinary sense of the word, it is impossible to affirm; but all those who are interested in the progress of the art, and who feel a curiosity as to what is doing abroad, could not fail to be gratified at the opportunity afforded them of hearing a large number of works which have never before been publicly performed in this country.

Before proceeding to speak of the music, let it be said once for all, that the performances were excellent throughout. Mr. Coenen is a pianist

whose technique is equal to all the demands made upon it by the modern bravura school, and who, moreover, plays with intelligence, and a due appreciation of the spirit of the various composers whom he interprets. The quartett of string players whom he has associated with him (Messrs. Wiener, Amor, Zerbini, and Daubert) are all so well known that the mere mention of their names is a sufficient guarantee for the quality of the execution.

The first piece produced at the present concert was Joseph Rheinberger's quartett in E flat (Op. 38) for piano and strings. This work was produced at the last season of the Musical Union, by Dr. Bülow, who has since performed it twice at St. James's Hall. It was, therefore, probably less absolutely new to some of the audience than the pieces which followed; but its beauties are such as to render it well worthy of a place in the programme. The work having been sent us for review, we shall defer a more detailed notice of it, and will only say here that it is full of most charming and original melody, and admirable in its treatment. Herr Rheinberger is nowhere diffuse, nowhere obscure. The quaint minuetto in G minor is perhaps the gem of the work, but the interest is well sustained throughout.

The next important novelty was a string quartett in C minor (Op. 51, No. 1), by Johannes Brahms, one of this composer's most recent works. This must, indeed, have proved "caviare to the general;" it is doubtful, indeed, if the large majority of the audience could understand it at all. It is, in truth, one of the most abstruse and elaborate compositions of its author—wonderfully clever, and with points which are really impressive, such, for instance, as the most original second subject of the "Romanze," but so intricate that, even with the score before one, it was no easy task to follow the train of the composer's thoughts. It may perhaps be said that it is as difficult to be understood now as Beethoven's later quartetts were at the time of their appearance. Whether the analogy will hold good that in fifty years' time this work would be as intelligible as the great quartetts in B flat and C sharp minor are at present, it would be rash to predict.

The other instrumental piece of the evening was Rubinstein's Fantasia in F minor (Op. 73), for two pianos, in which Mr. Coenen was ably seconded by Herr Adolph Schloesser. This work is a most curious mixture. Side by side with noble and beautiful ideas are to be found pages of the most incoherent rhapsody. The impression produced in places is that Rubinstein is trying how much tone he can produce from two pianos without introducing anything that can, by the wildest stretch of imagination, be called a melody; and immediately afterwards subjects are presented which, if more judiciously treated, would have produced a masterly effect. The piece is exceedingly brilliant, and requires what may be termed a "slashing" style of performance, which it undoubtedly received. The fullest justice was done to the composer's intentions, and we could hardly have imagined that two pianos could make so much noise. This is not said in blame of the performers, who did no more than the music required; but the work is in itself one of the noisiest ever written. The *allegro vivace*, however, in A flat, must be excepted. This is a really charming and elegant movement, and afforded a grateful relief after the preceding tempests of sound.

The instrumental music was interspersed with songs by Miss Ferrari and Miss Antoinette Sterling, of which it is only needful to mention two which were sung by the latter—Liszt's "Der du von dem Himmel bist," and Rubinstein's "Die Waldhexe." Of the former it is only honest to say that at a first hearing we were quite unable to understand it; the second, a highly dramatic piece, was much more effective, and was encored. The full significance of it was, however, lost, as Miss Sterling sang in German, and must therefore have been in a great measure unintelligible—the more

so as the words of the song were not printed on the programme.

The second concert takes place next Wednesday, when a suite by Miss Agnes Zimmermann, another by Camille Saint-Saëns, and an octett by Johan S. Svendsen, will be performed.

LAST Saturday's concert at the Crystal Palace presented several features of interest, but can only be briefly noticed. The larger part of the afternoon was occupied with a performance of the ever-welcome *Midsummer Night's Dream* music, which, it may be safely said, can be heard nowhere in such perfection as at Sydenham. The wonderful *scherzo*, especially, is a *cheval de bataille* for the Crystal Palace orchestra. The delicious crispness of the *staccato* for the wind instruments, the certainty and delicacy of the strings, and Mr. Alfred Wells's flute solo at the close of the movement, are things which must be heard to be imagined. The movement was encored, as it always is here. Hardly less delicious is the *Notturmo*, in which the important horn solo was most admirably played by Mr. Wendland. *The Clown's Funeral March*, again, finishing with a squeak for the clarinet, and a grunt for the bassoon, is one of the best pieces of comic music ever written. The performance of the whole work last Saturday was excellent, not only as regards the band, but the chorus, which mustered some 200 ladies, and which seems rapidly improving. Mendelssohn's beautiful motett for female voices, *Surrexit Pastor Bonus*, a novelty at these concerts, was also capitally given, the solo parts being in the hands of Madame Otto-Alvsleben, Miss Emily Spiller, Miss Dones, and Madame Patey; Dr. Stainer presiding at the organ. Schubert's *Twenty-third Psalm*, for female chorus, though very graceful, is not one of his most striking compositions. It was originally written with piano accompaniment; but as this would have been ineffective, if not inaudible, against so large a body of voices, it was scored for orchestra by Mr. Manns, who executed his task with great taste and judgment. The concert commenced with Beethoven's overture to *King Stephen*, followed by the chorus "See with flowers," from the same work, and concluded with Mr. Alfred Holmes's MS. overture to *Le Cid* (first time of performance). This work shows considerable ability both of invention and treatment; it is, however, somewhat diffuse, especially in its latter portion, which would gain materially by compression.

At the last Monday Popular Concert, Herr Joachim was again the chief attraction, contributing as his solo Tartini's sonata, known as "Il Trillo del Diavolo," a work which, though less remarkable both as a composition and as a show-piece than the sonata by Bach, which he introduced on the previous Monday, is well worth hearing, especially when played as Joachim plays it. But to musicians the great treat of the evening was the truly superb performance, by Messrs. Joachim, Ries, Zerbini, and Piatti, of Schubert's quartett in D minor—the finest, with the single exception of that in G major, of all his works of this class. One is sorely tempted into a long digression in speaking of this truly wonderful work, in which, while the influence of Beethoven is clearly traceable in parts of the second and last movements, the individuality of Schubert nevertheless asserts itself so strongly. The great length, at times even diffuseness, so characteristic of Schubert's later instrumental works, is to be observed here; but, as elsewhere with this composer, it results from the inexhaustible prodigality of his invention. It is known that he wrote with the utmost rapidity, and seldom revised his works; yet so full are they of charming effects and delightful surprises, that few listeners experience any consciousness of fatigue in hearing them. In the present case, most of the audience at St. James's Hall would probably have been astonished had they been told that the performance of the quartett lasted more than three-quarters of an hour; that

it was not too long was clearly shown by the unflagging attention, which was sustained to the last bar. The pianist of the evening was Mr. Franklin Taylor, who played more finely than we ever remember to have heard him. His rendering of Beethoven's "Sonata quasi Fantasia" in E flat (Op. 27, No. 1—not No. 2, as incorrectly given in some editions), and of the same composer's Trio in E flat (Op. 70, No. 2), in which he was joined by Herr Joachim and Signor Piatti, was from every point of view thoroughly satisfactory. The vocalist was Mr. Henry Guy, who is rapidly making his way in the profession. Besides an elegant song by Molique, he sang two charming MS. songs by Sir Sterndale Bennett.

Ebenezer Prout.

THE prospectus just issued by the Philharmonic Society for its coming season is of great interest and promise. Among the more important of the works to be produced are:—Spohr's MS. Overture in F minor, composed for the Philharmonic Society; Berlioz's Overture to the *Carnaval Romain*, Sullivan's to the *Tempest*, Rheinberger's to the *Taming of the Shrew*, Potter's to *Antony and Cleopatra*; Raff's new "Leonore" Symphony; Handel's Concerto in A for stringed instruments (No. 11 of the "Twelve Grand"); Brahms's Serenade in A for small orchestra; Sir Sterndale Bennett's music to *Ajar* (overture, choruses, and funeral march), composed for the society; the Schubert-Liszt Fantasia in C; and Hiller's Concerto in F sharp minor. The first concert takes place on the 25th proximo.

THE last number of the *Musikalisches Wochenblatt* contains an interesting communication from Richard Wagner, in reply to numerous requests from his friends that he would send them fragments of the score of his *Walküre* for concert performance. While fully appreciating the friendly motives which prompt the request, he regrets that he cannot accede to it, as it would be prejudicial to the performances of the whole work which he is so carefully preparing. Could his friends, he says, really appreciate the work by means of fragmentary performances in concerts and theatres, it would not require the great trouble which he is taking to ensure a production which shall be intelligible. He adds that the problem of such a performance has still to be solved by himself; as the remarkable success of the performances of the *Walküre* at Munich, in which he took no part, proves how little it had been really understood; for had it been rightly understood it could not have occurred to anyone to ask for fragments for concert performance, though this would seem very easy to those who take pleasure only in a few so-called "happy" isolated portions of the work.

SCHUMANN'S *Genoveva*, which has lately been revived in several theatres on the continent, has now also been placed on the stage at Wiesbaden.

AN opera by August Horn is to be produced shortly at the Stadttheater in Leipzig.

A NEW opera, *La Contessa di Mons*, by Lauro Rossi, has met with great success on its first performance at Turin.

ANTON RUBINSTEIN arrived recently at Vienna, where he purposes staying for some time.

A CORRESPONDENT of the Leipzig *Signale*, writing from Rotterdam, speaks in the highest terms of Franz Holstein's opera *Der Haideschacht*, which has been recently produced in that city.

THE *Débats* says that at a concert to be given by Madame Ernesta Grisi, a newly-invented instrument, called "le cécilium," is to be heard for the first time. No details are furnished as to the nature of the instrument.

ON the 17th instant Sir F. Gore Ouseley's oratorio of *Hagar* was performed in the Sheldonian Theatre at Oxford: the first time it has been heard in public since it was brought out last year at the Hereford Musical Festival.

POSTSCRIPT.

THE Society of Arts offers its gold medal, or 20*l.*, for the best revolution indicator for ships which shall correctly inform the officer in charge of the number of revolutions the paddles or screw are making per minute at any time without the necessity of counting them. The error of the instrument must not exceed 2 per cent. It must be simple, not easily deranged, easily refitted, and must not depend for its accuracy on the steadiness of the ship. If an instrument fulfilling most of the conditions set forth were invented and taken into general use, it would no doubt considerably lessen the risk of life at sea; and if some one of the various "speed indicators" now known were employed in large steam vessels, we should hear of fewer accidents like that of the *Atlantic*.

THE Bodleian librarian has been carrying on diligently the work of arrangement and cataloguing at which he has already done so much. Recently the classification of the Charters of Religious Houses, of which the Bodleian Library possesses a large collection, has been completed. These are now thoroughly catalogued, and arranged for convenient reference. The University Museum has also received the valuable addition of a large collection of Saurian fossils from the Lias of the South of England, which has been presented by Mr. T. Hawkins, F.G.S.

THE German Parliament bids fair to become tolerably representative of educational interests. There were till lately no fewer than ten schoolmasters in the House of Deputies, and the recent election of Theodor Hoffmann, of Hamburg, makes eleven. Have we one schoolmaster in the House of Commons?

THE *Athenaeum* states that the archaeological world of Madrid has been lately shocked out of its propriety by the report that the Ayuntamiento of Zamora had decided to demolish the classic walls which surrounded that city, the Ocellum Duri (the calyx of the Duero) of the ancients. Fernando el Magno (1035) has the credit of completing them: river, town and walls are immortalised in a dozen of the old romances of "the Cid." Zamora was proverbially for centuries impregnable, hence the old refrain:—

"A Zamora no se ganó en una hora"

(Zamora cannot be gained in an hour).

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER and not to the EDITOR.

LITERATURE.

DRUMMOND OF HAWTHORNDEN.

Drummond of Hawthornden: the Story of his Life and Writings. By David Masson, M.A., LL.D., Professor of Rhetoric and English Literature in the University of Edinburgh. (London: Macmillan and Co. 1873).

CHARLES LAMB, "fearing to be thought fantastical," confesses that "the names of some of our poets sound sweeter, and have a finer relish to the ear—to mine at least—than that of Milton or of Shakespeare. It may be that the latter are more staled and rung upon in common discourse. The sweetest names, and which carry a perfume in the mention, are Kit Marlowe, Drayton, Cowley, and Drummond of Hawthornden." When the interest in Drummond was revived by Mr. Laing's discovery in 1832 of the authentic Notes of the Conversations with Ben Jonson, Mr. Peter Cunningham brought out an edition of the *Poems*, and in his preface, advertising to this and other fresh material then accessible, remarked that a "life of some interest ought to be expected." But not till now has the expectation been fulfilled. Mr. Masson's familiarity with the great struggle of the seventeenth century admirably fits him for the task of placing in its due relation to the history of the time and to the rest of Drummond's life that part of it which has hitherto been almost unnoticed. Throughout, a full narrative of contemporary events connects the sparse biographical particulars. The biography is sometimes unduly conjectural, and the writer's descriptive powers are not always so happily employed as in the charming introductory sketch of Hawthornden. That Drummond, on being pressed to see Cromwell at Edinburgh as the English representative of that liberty of conscience for which he had himself contended, should have replied, "Liberty of conscience be—," does not strike the reader as a felicitous effort of imagination. There is a "coddling" effect in the repeated emphasis on the "nice" rooms, "nice" library, &c., of Hawthornden, and the moonlight walk (p. 72) verges on namby-pamby. Not every one would relish the implied partnership in the familiarity with Ben Jonson in the apostrophe, "O Ben! Ben!—Never mind! One likes," &c. (p. 184). But these are only occasional blemishes on a pleasant book.

William Drummond was born December 13th, 1585, the son of the first laird of Hawthornden, a courtier of James VI. "From his infancy, therefore, the poet was within the radiance of Scottish royalty, such as it was." After graduating at Edinburgh, he went abroad to study law, taking London in his way, and returned to Scotland in 1609. The next year, after his call to the Bar, his father died, and Drummond at four-and-twenty found himself "Laird, with

sufficiently ample means, and free to choose his own course of life."

Drummond kept lists of the books he read, and in them appear—Knox's *Reformation*, Sidney's *Arcadia*, *Euphues*, *Orlando Furioso*, the *Faery Queene*, *Du Bartas*, *Itabelais*, and odd plays and poems of Shakespeare—*Romeo and Juliet*, *Love's Labour's Lost*, *Midsummer Night's Dream*, *Lucrece*, and *Passionate Pilgrim*. Mr. Masson doubts whether in 1606 the still living Shakespeare could have been told of any other young Scotchman who had paid him the compliment of reading so much of his work. But, considering the Court favour which Shakespeare had enjoyed during two reigns, it may more reasonably be presumed that other young Scots would, if but for fashion's sake, be acquainted with—

"Those flights upon the banks of Thames
That did so take Eliza and our James."

Afterwards, indeed, Mr. Masson concedes as much in allowing that, even before the king's accession to the English throne, "books from London must have crossed the Tweed . . . occasionally a copy of the *Shepherd's Calendar* . . . a play of Shakespeare, or some other messenger of light and sweetness slipped into the parcel." Among the poetical lamentations on the death of Prince Henry in 1612 was Drummond's first publication, *Tears on the Death of Moeliades*. Mr. Masson compares it to *Lycidas* in its sustained pastoralism and poetical tact. As one reads, one is apt to shiver in its chilly classic air, warmed by few and wintry rays of the imagination that glows in every line of *Lycidas*. Drummond's melancholy muse was soon to find a subject nearer home. In 1616 appeared his *Poems* in two parts. The first was a record of his happy wooing of "a fine, beautiful young lady, daughter to Cunningham of Barns, an ancient and honourable family." The second was a memorial of his grief at her sudden death, after the marriage-day had been fixed, "and all things ready for the solemnisation." The sonnets in which he extols his love and laments her loss are graceful and elevated. Spenser is evidently his model. One of these poems quoted by Mr. Masson has a line recalling a familiar passage of Gray's *Elegy* :—

"Far from the madding worldlings' hoarse discords."

In his happier hours Drummond had enumerated the most famous rivers in the world, and (remembering that on the banks of the Ore in Fife he had first seen his lady-love), had concluded that not all of them together—

"Have ever had so rare a cause of praise
As Ora, where this northern Phoenix strays."

When he next celebrated the "Ore with rusby hair," it was with no such proud pre-eminence. That river-nymph was bidden with other Scottish streams to attend the Forth at the reception of James on his visit to his northern capital. *Forth Feasting* was Drummond's expression of the exuberant loyalty of all his countrymen. It was a thorough-going "panegyric on the King's most excellent Majesty." The monarch is lauded for his kingcraft, but above all for his efforts as a prentice in the Divine art of poesy :—

"With lute in hand, full of celestial fire,
To the Pierian groves thou didst retire :

There, garlanded with all Urania's flowers,
In sweeter lays than builded Thebæ's towers,
Or than which charmed the dolphins in the main,
Or which did call Eurydice again,
Thou sunst away the hours, till from their sphere
Stars seemed to shoot, thy melody to hear."

The last couplet, as Mr. Masson points out, is a reminiscence of Oberon's speech to Puck in the *Midsummer Night's Dream*. All this praise is capped by the compliment that Apollo and the Muses came hither

"To see thine isle : here lost their native tongue
And in thy world-divided language sung."

In 1618 Drummond began a correspondence with Drayton, who was vainly trying to get the second part of his *Polyolbion* brought out at Edinburgh, and the same year Ben Jonson trudged on foot to Scotland in search of novelty and humours. Not until the Christmas season was paid the ever-memorable visit to Hawthornden. Drayton to his life's end retained an affection for Drummond, but on the other friendship Fate looked frowningly. A correspondence—protesting too much—was eagerly begun almost as soon as Jonson was over the threshold, but did not last out the summer. Even during the visit (as we gather from the notes made then or immediately after) the inevitable *amari aliquid* had arisen. Of its exact origin more might have been known had not Ben Jonson's memorials of his Scottish tour perished in the fire which consumed his lodgings in 1620. But neither Mr. Cunningham nor Mr. Masson found any difficulty in guessing the probable cause—the incompatible temperaments of the two men. They wished to be friends; but the passionate, robust nature of Jonson discomposed and shocked the staid, delicate, and somewhat pedantic Drummond. They agreed in one thing. Both were possessed by an irritable spirit of self-assertion: Jonson showed its workings in his loud, blustering, hectoring vein; but Drummond's vanity "struck in." It is probable that the Notes of Jonson's Conversations were circulated among Drummond's friends, and Jonson may have had some hint of their contents; but one circumstance seems to have escaped the notice of those who have written on this matter. Among Drummond's posthumous poems, printed pell-mell in the edition of 1711, is one evidently written during the reign of James, and imploring quite seriously the divine protection for the king's five senses against certain dangers peculiar to each. Now, in Jonson's *Gipsies Metamorphosed*, a masque of 1621, there is a burlesque counterpart of this petition. In Drummond's verses the king's partiality to his favourites is pointed at with astonishing freedom, and it is easy to conceive that the lines would give great offence at Court. Drummond's friend and correspondent, Kerr of Ancram, "revisited England in 1621" (the year of the masque), but Mr. Masson does not further specify the date. Whether Kerr showed the verses to his London friends or not, is matter of conjecture, but there are the two poems, and it seems likely that we have in them the result, though not the explanation of the coolness between their authors.

In 1623 Drummond published *Flowers of Sten*, to which is adjoined his *Cypress Grove*, an essay. The poems are distinctively Christian, including hymns on the Nativity,

Passion, Resurrection, and Ascension—the essay is a Meditation on Death. Besides the anticipation of Milton in the selection of the sacred themes, there are expressions here and there that recall the strains of the “fuller minstrel.” The passages quoted by Mr. Masson from the *Cypress Grove* fully bear out his commendation of its pensive beauty, its moral high-mindedness, and the mournful music rolling through it. But, though a happy phrase now and then recalls Sir Thomas Browne (e.g. “death is a short, nay, sweet sigh”), its monotony will not bear comparison with the *Urn Burial*, or the *Garden of Cyrus*. They resemble Spenser’s “rich strand,”

“where heaped was
Exceeding riches and all precious things,
The spoil of all the world.”

Some parts of the *Cypress Grove* appear to have been suggested by Bacon’s *Essay on Death*, published in 1612. Mr. Masson does not notice, though he doubtless observed, that the extract at p. 137 is a prose transcript of the lines at p. 64, on the Vanity of Life—from the poems of 1616. From 1623 to 1627 when, probably, Drummond obtained his patent for new military inventions, the indications as to his life, or even his whereabouts, are very scanty. “Thundering Rods or Box Dragoons, Fiery Waggon, Glasses of Archimedes” (to set on fire “at whatever distance, whether on sea or land,” any combustible stuffs out of all reach of shot) are some of the death-dealing weapons invented by the author of the *Cypress Grove*. Other contrivances there are, of more peaceful purpose—the Sea Postilion (“a light craft, very rapid even with an adverse wind”) the Wind Measure and Length Compass (for observing the strength of winds and the exact length of sea-voyages), the Slip-fountain (for making salt-water fresh), and lastly “an organic machine, producing, from a natural and never-wearied cause, perpetual motion.” The significance of all this in relation to Drummond is much lessened by the circumstance that, in the war with France and Spain then in progress, “patents in such materials and fabrications were the order of the day.” “With no greater care have arsenals and storehouses been founded with all equipments for war than libraries have been founded for the studies of war and peace.” Drummond having furthered, or at least intended to further, his country’s service in the one department, would not be backward in the easier contribution of the weapons of wit. The catalogue of his donation of about 500 volumes to Edinburgh University is dated in the same year as his patent, and the sentence above quoted from its preface connects the two facts.

This parting with his books (not quite “a cartload of rubbish” *pace* Gifford) has perhaps more significance than we are able to assign to it from the few biographical indications now attainable. Mr. Masson conjectures that Drummond now gave up housekeeping, and it is certain that he now bade farewell to literature, so far at least as poetry and imaginative prose were concerned. His writings after 1630 were occasional pamphlets written to serve the political purpose of the hour, and a history of the five Jameses of Scotland. The pageant-

verses he supplied on the occasion of the visit of Charles to Edinburgh, the pasquils that he wrote from time to time to ease his spleen against the dominant Presbyterian faction, and an occasional epitaph, form the only exceptions to this statement.

Mr. Masson carefully elucidates Drummond’s pamphlet, *Considerations to the King* (Dec. 1632), by a *résumé* of the curious history of the Stratherne Earldom. That title had been borne by a son of Robert II. by his second and undoubted wife, Euphemia Ross. The reigning Stuarts were descended from his first wife, Elizabeth Mure, who had been his mistress. There had always been awkward questions as to the validity of that connection, and even a doubt whether it were not really his *second* marriage. For these reasons, the Stratherne Earldom had been cancelled by James I. in 1428, and the Menteith title given in exchange to its bearer. The William Graham, who, in 1632, was Chief Justice and President of the Council, had applied for and obtained a restitution of the Stratherne dignity. Drummond took interest in the matter because, through Annabella Drummond, Queen to Robert III., there was a far-away connection of all the Drummonds (from their chief, the Earl of Perth, to the youngest cadet of the family) with the royalty whose very existence, he thought, was imperilled by the rash grant to Graham. There is much doubt whether the *Considerations* were ever really sent to the king. Charles, after certain charges had been made against Stratherne by an accuser who failed to prove them by evidence, punished the failure heavily, but acted on the information by depriving Graham of both his earldoms, and banishing him to his estates. The unlucky noble was afterwards re-admitted into the Scottish peerage as Earl of Airth.

On March 2, 1635, Drummond wrote another letter of remonstrance to Robert, Earl of Ancram, with the broadly-hinted intention that it should be shown to the king. Its subject was the iniquity and folly of the proceedings against Lord Balmerino, who had been tried for his life, found guilty by a casting vote, and remitted to prison till the king’s pleasure as to his execution should be known. His offence had been the possession of a letter imploring Charles to be careful in the “Bishops’ business” about which he had come to Scotland, and not to introduce into the discipline of his mother Church “anything not compatible with the honour thereof.” Even Laud could not advise that the sentence should be carried out, and Balmerino was released. The letter of Drummond is so outspoken, even hinting that the king had an eye to the forfeiture of Balmerino’s estates, that (remembering Drummond’s wont in such matters), it is not very likely that it was actually despatched.

When the Bishops’ business had come to an end, and the king had been forced to an unequivocal surrender of his pretensions to remodel the ecclesiastical polity of Scotland, he still tried to soften his defeat by inducing the Scotch to throw over their covenant in favour of a new and revised edition. Drummond employed all his eloquence in favour of the king’s proposal in *Irene*. He blames the Presbyterian clergy for the continuance

of civil dissension, and earnestly appeals to Charles to restore anything his subjects may have lost “of what they feign to be liberty (which is only a power to do what is convenient).” His mediation was useless. It was practically timid, however bold in expression. He never published it, but only distributed MS. copies to “noble lords” and persons of influence. And here begins the final phase of Drummond’s career, which Mr. Masson so fully illustrates. Harassed by the discipline of the Kirk, and incensed at its continued triumph, he wrote his *Skiamachia, or Fight with Shadows*, for private and clandestine circulation. In it he accuses the English Parliament—the date is 1643—of malice against the king, and the Scotch clergy of greater presumption and more outrageous tyranny than the Inquisition had been guilty of: “Presumptuous churchmen have proved worse than the foxes of Samson.”

To a man in this temper the Solemn League and Covenant—a new version of the old Scotch Covenant for the use of Great Britain—must have given cold comfort. If his foes had come like shadows, they certainly did not so depart. He had been himself forced to take the Covenant, raging inwardly, and found consolation in writing squibs, invectives, sledgehammer queries for the demolition of elaborate Covenanter arguments—all for private circulation. He anticipated being called to account for these recreations in a speech designed to have been spoken before the Presbyterian “Circular Tables.” “He meant to be very brave.” But that there was any real danger seems doubtful. He appears to have had influence enough to procure a retreat in the benefice of his parish of Lasswade, for an ex-bishop who was “in extreme misery,” being a marked man, rejected of all presbyteries, till he found shelter near Drummond.

In 1645, when Montrose’s success promised some set-off to the disaster of Naseby, Drummond’s hopes rose high. Now that the “golden age had returned,” he hastened to present his *Irene* to Montrose for his sanction to its publication. But a fortnight afterwards Montrose had fled to the Highlands, after the rout of Philiphaugh, and Drummond, in his next production, had to alter his tone altogether. Charles was in the Scotch camp, and the question of the day was whether or not he should be given up to the English. To avert the alternative dreaded by every loyal Scot, Drummond writes (in the character of a Presbyterian), his *Objections against the Scots Answered*. He actually takes credit to the Scotch for the defeat of Montrose, and founds thereon a claim to the gratitude of England, “for if unhappily we had joined with them, the state of affairs in England had fallen to as low an ebb as now they swell in a high tide.” After this, the ill luck of his next and last political tract comes as an anti-climax. He wrote a “Vindication” of Hamilton, then on his disastrous expedition into England for Charles and Presbyterianism. News came that Hamilton was prisoner to Cromwell, and the Vindication was mere waste-paper.

Everything for which Drummond cared was now rushing down to ruin. Charles was

executed; England was a republic; and Scotland, nominally a monarchy, was under the strictest Presbyterian rule—

"Save that sun's light we see, of good hear tell,
This Earth we court so much were very Hell."

So he writes in one of two very wooden sonnets. His hand had lost its cunning, save when he feelingly laments those of his friends who "died with our Monarchy and State." His own period was at hand. "Weakened with close study and diseases," he lingered till December 4, 1649—"wanting only nine days of sixty-four years of age"—and was honourably buried in his own aisle in the (now ruined) church of Lasswade.

Drummond's literary reputation rests mainly on his sonnets. He has a gentle thoughtfulness, a pleasing smoothness, in his best verses. He has neither the felicitous phrasing of Sidney, nor the exquisite facility of Spenser, who runs off his fourteen lines trippingly, giving adequate, not redundant, expression to their one leading thought—not to speak of the rich luxuriance of Shakespeare, whose main idea is attended by a crowd of strong and graceful images, just not obscuring it.

In his political life Drummond was always rehearsing for a performance that never came off. Indeed, his claim on our interest is, after all, that for one week or so, as the *umbra* of Ben Jonson, he sat at the table of the gods. After that, *vixit*. The rest of his life was merely mortal, and has at last received its fitting obsequies from a reverent and worthy hand. R. C. BROWNE.

Lettres à une Inconnue. Par Prosper Mérimée, de l'Académie Française. Précédées d'une *Etude sur Mérimée.* Par H. Taine. Cinquième Edition. (Paris: Michel Lévy frères).

It is in reading Taine's preface to these letters that people who were not personally acquainted with Mérimée may come to understand the strange stir which their posthumous publication has made in France. For through the medium of his friendly biographer they will realise how much of it is undoubtedly due to the fact that these letters are the outpourings of a heart which was supposed not to exist, or, at all events, to have been persistently denied any outward expression of emotion—the result, we are called upon to believe, of a resolution made in early childhood. When only about ten or eleven years old, relates Taine, Mérimée, having committed some fault, was severely scolded and sent out of the drawing-room. Crying and upset, he had just closed the door, when he heard a laugh, and some one said, "Poor child! he thinks we are very angry." The idea of being a dupe revolted him, and he swore from that day forth to repress so humiliating a sensibility, and kept his word, taking for his motto, *Μέμνησο ἀνιστείν* (Remember to be on the defensive).

This story does not convey a pleasant impression of the hero, and it is, perhaps, well for Mérimée that few will believe that he could have been steadfast all his life to a purpose born from a momentary pique at so tender an age, and will regard it as merely

a formulary of a subjective idea by which he accounted to himself and to others in an interesting and satisfactory way for the peculiar coldness and inexpansiveness of his natural manner. No doubt he himself firmly believed all along that this episode had altered his original character, but children as well as grown-up people are occasionally given to dwell upon ideas until they believe them to be realities, a state of mind with which the most perfect honesty is not only compatible, but in which it is positively implied, for doubt only troubles the mind when there are facts to check convictions.

But it was not solely because Mérimée was personally cold, stony, and unsympathetic that the Parisian public threw itself wildly upon his letters: another cause is assignable to the mystery which enveloped, if it does not still envelope, the name of the fair recipient. French by birth, English by education ("Quelle drôle d'éducation vous recevez en Angleterre."—Letter III.), the lady was well known to all the friends of Mérimée, though not one of them was aware of a correspondence which lasted about twenty-eight years, perhaps longer, for some letters had evidently preceded the first of those published, since in it he alluded to his last as fearing he had been too frank therein in speaking of his own character, and quotes a good *mot* of an old *diplomate*, "Never speak ill of yourself; your friends will always do so for you."

Elsewhere he puts to himself the question, "How is it that the most indifferent men are always the most loved?" It does not transpire that the "unknown" disputed the premisses; so, perhaps, on the above principle, he takes care that his expressions should be more remarkable for their cynicism than anything else. A very bad substitute, by the way, for indifference. It is cynicism, moreover, even at its worst, of a transparent and superficial nature; but he played at it so long that it is not surprising that his best-intentioned sentiments should be liable to misconstruction. A passage which at first sight might seem to exhibit a hopeless aberration in that respect is one in which he speaks of having been to a ball given by some men of his acquaintance to which most of the *figurantes* of the opera were invited. "These women are mostly stupid (*bêtes*)," he continues, "but I have remarked how superior they are in delicacy to the men of their class. They are separated from other women by only one vice—poverty." He was right in lecturing his correspondent, if a contemporary critic is correct in inferring from his next letter—but which we must confess we do not infer—that she felt herself aggrieved, and called him to account for the above. As if to say, "I have seen *figurantes* who are nearly as good as you are," necessarily admitted of the converse, "You are little better than a *figurante*." Moreover, his continuation of the theme in the next letter leaves us in no doubt that he meant to be the reverse of cynical or insulting to the sex in general. "The aristocracy have raised insurmountable barriers between the different classes of society in order to prevent one from seeing how much what goes on without resembles what

goes on within," he writes, and does not say that these barriers are raised to prevent one from seeing how much what goes on *within* resembles what goes on *without*—and then follows a pretty and appropriate little story, which we might possibly have lost if the "Unknown" had read his letter more carefully.

Throughout it would be hard upon Mérimée to base a serious judgment upon any of the numerous paradoxes which season his letters, most of which were probably thrown in for mere effect. Conspicuous among such sentiments is his speech *à propos* of the fireworks in Paris, which, in his opinion, must be superior to a volcano, for "Art is always better than Nature." An artist himself, and a writer upon art, he must have been turning over in his mind the question why it should come so naturally to all men to praise Nature by comparing it to Art, if it were as manifestly absurd to do so as sages opine. Art is not better than Nature, but Nature has a hundred thousand different expressions, and Art only takes cognisance of the best. Therefore what she loses in fidelity and in vividness she gains in combination and completeness. She has less of the beauty of Nature, but she has none of her ugliness. It is the sense of harmony which Art conveys, the absence of all that jars against the perfect beauty of a landscape, the intentional bringing together of conditions and elements which are not often found combined in Nature, which is the respectable substratum of the vulgar exclamation in the presence of an exquisite landscape, that it is like a picture or a scene in a play.

Mérimée had travelled a good deal earlier in life, and during the long period of his correspondence he shifts his direction continually, without ever getting very far from home, and is always turning up again at the same point. Seldom are more than two of his letters running addressed from the same place. Biarritz, Paris, Compiègne, Cannes, ditto, London (British Museum), ditto, Paris, Bagnères de Bigorre, ditto, Biarritz, Paris: this is a result of opening his letters at random, and conveys an idea of his squirrel-like movements. From England his letters are more discontented, fault-finding, and bilious in their tone than from elsewhere, though he never writes cheerfully except from Paris, and his dislike to French provincial towns is only commensurate with his aversion to Court life, for although he invariably speaks with affection of the Imperial circle, the whole rôle of a courtier was irksome to him, from the *pantalon collant* to the review exacted from him of the *Life of Caesar*, where he sought to acquit himself with tact and dignity, and give satisfaction to the Imperial author without stooping to the tone of a sycophant.

It may possibly have been owing to the preoccupation of his mind that he never seems to take more than a superficial interest in anything, and, like all people who are bored themselves, he fancied every one was bored around him. At Taymouth Castle, not only Lord Breadalbane, but even the bison in the park, seem to him to share the general blight. Probably no creature about the place was really bored but himself; but

here, as elsewhere, he managed to find a pretext for some of the usual sharp and pungent speeches with which he habitually salted the sawdust of his life. Here is a speech of M. Thiers quite to his taste, extracted from a long story, which he relates with great relish and in his best style. A party of great men had met at the house of an Academician for the purpose of being present at the introduction of Béranger to Rachel, who afterwards favoured the company with a recitation from *Esther*. "During an interval in the performance, Victor Hugo and Thiers began disputing on the subject of Racine. Hugo said that Racine's was a small mind, and Corneille's a great one. 'You say that,' answered Thiers, 'because yours is a great mind. You are the Corneille' (here Hugo assumed a very modest expression) 'of an epoch of which Casimir Delavigne is the Racine.' I leave you to judge whether modesty was appropriate or not on the occasion." The amount of sarcasm in Thiers's speech depends entirely on Hugo's appreciation of Casimir Delavigne, and what that was everybody knows.

Mérimée himself could hardly have come to Hugo's rescue consistently with a sentiment expressed to his Unknown—viz., "I abhor French verses"—à propos of some that he had translated by preference rather into English than French.

The letters are in two thick volumes, giving ample food for digestion, even when allowance is made for the wide type and the inordinate margin, which is in the fate of modern French books. The nature of the collection is hardly exciting enough to permit of any excisions, for a book but moderately stimulating can only redeem itself by prolonging the reader's attention until his interest in the personality of the characters balances the want of less legitimate elements. It is not only because we live in a different age that people who were fascinated by *Clarissa Harlowe* in their youth could not stand the tedium of re-reading it in its modern one-volume edition. But with whatever feelings we may peruse the two volumes of Mérimée's letters, no one can arrive at the last short note, written but four hours before his death, and ending (with a slight strain upon the tense) almost as prophetically as *Kenelm Chillingly*—"Je suis parti. Adieu! je vous embrasse"—without a tender feeling for the man with whom he becomes acquainted in these pages. For, whatever our opinion of him may be, it is no small praise to say that the force of his individuality is sufficient to exact one. It is a book that one opens with expectation, reads with disappointment, but closes with regret.

FRANCES MARY CHARLTON.

DR. EBERS ON MOUNT SINAI.

Durch Gosen am Sinai. Von Dr. Georg Ebers. (Leipzig, 1872.)

DR. EBERS' work is divided into two parts, the first entitled "From the Travelling Journal," and the second "From the Library;" and this arrangement is exceedingly convenient for the reader, who will find the question of the Land of Goshen and the scenes of the Exodus of the Israelites discussed either from the familiar point of view of a

traveller, or from the more critical standpoint of a profound scholar and archaeologist. Upon the first portion of the book it will not be necessary to dwell at any great length; it is what we should naturally expect from the notes of an observant traveller charmed with all he sees, and extracting novel sensations out of the most commonplace phases of Oriental life, as tourists, and especially sentimental tourists in the Holy Land, are wont to do. No new ground is covered by the journey; and although there is a freshness and simplicity about the narrative, yet it is all of the orthodox stereotyped kind, and the experienced reader of travels in the Holy Land knows beforehand exactly what the description of each place will be, and what emotions will be recorded as arising on the occasion of a first visit to it. There is, however, one thing which makes Dr. Ebers a very desirable travelling companion over the scenes which he describes, and that is his extensive knowledge of Egyptian antiquities; and although the greater part of his researches in this direction are reserved for the "Library" portion of the work, yet he tells us *en passant* much that is both instructive and entertaining.

His views upon the route of the Israelites from the Red Sea to Sinai, and upon the position of the Mount of the Lawgiving, are almost identical with those of Professor Lepsius, whose route he followed, accompanied by the same dragoman, and whose conclusions he somewhat too unhesitatingly adopts. Dr. Ebers, indeed, makes it no secret that he undertook his journeys in order to confirm certain preconceived ideas.

"The power of travelling in distant lands may well be considered a heaven-granted boon to every sensible man; but he only can truly enjoy it who by means of previous study has gained an accurate knowledge of the countries to be visited, and now, when he sees with his bodily eyes what he has hitherto only pictured in the imagination, finds himself in a position to compare his preconceived ideas with the reality, and to correct and enrich them by the evidence of his senses. Good previous study is the most necessary requisite for every journey in distant lands, but pre-eminently so for travel in the sacred places of the East."

Although it is true that study is most necessary, yet the majority of travellers unfortunately take with them to the East preconceived ideas as the result of their studies; and it is to this that we owe half the existing misconceptions about the Holy Land.

Such being the author's state of mind, we need not wonder that he finds Mount Serbal to be Sinai, and takes the Israelites through his own and Lepsius' favourite working ground, the Mafka mines at Wady Maghârah. To miss such a spot was for an Egyptologist out of the question; and as he could not follow all the routes through the peninsula, he did what many travellers before him have done, and adapted the Israelites to his own.

Now it so happens that Lepsius, although possessing a keen eye for a hieroglyphic cartouche, is a painfully unobservant traveller, and but few of his topographical statements are to be relied on, as I have myself frequently proved by personal experience. Nothing is easier than to make out a case for Serbal by arguments "From the Library,"

and such an inspection of the neighbourhood as could be made in one or two days need not, perhaps, modify the view. But a few weeks' sojourn in Wady Feirân and its vicinity, and the additional evidence of the theodolite and level, dispose of the pretensions of Serbal in a most convincing manner.

Dr. Ebers would have done well to delay his book until the publication of the maps and statistical reports of the Ordnance Survey Expedition were published. Had he done so, he would, I venture to assert, have followed the example of the editor of the *Speaker's Commentary*, and cancelled certain sheets of his book in which a theory is advocated which is absolutely at variance with the topographical facts. Anyone who will take the trouble to glance over the Ordnance Survey maps, and to read at the same time the straightforward and (in spite of commentators) simple account of the Exodus given in the Bible, must inevitably be led to the conclusion that, wherever else Sinai may have been, it was certainly not Serbal.

As far as Wady Gharandel, which or the neighbouring valley of Useit he identifies with Elim, Dr. Ebers' account of the itinerary of the Israelites agrees with that of the majority of travellers, the Ordnance Survey party included. After this point he suggests a different and, as I believe, an improbable, if not impossible route.

"From Wady Gharandel or Usêt (Elim) to the Red Sea (Ras abu Selimeh), where there is still (?) a landing-place for Arab boats, and the wanderers might have received supplies, we find a greater or lesser day's journey, according to which place we fix upon as Elim. Between the Red Sea and Dophkah (Wady Maghârah, or Tmafka) is an encampment in the desert of Sin, the rocky wilderness which we passed in one day's march. But as the journeying here becomes more difficult, it seems most natural that the Hebrew wanderers should strike their tents in the rocky valley of Schellâl. The Biblical description in Exodus xvi. makes no mention of the encampment by the Red Sea mentioned in Numbers xxxiii. 10, but it says (Exodus xvi. 1-3), 'And they took their journey from Elim; and all the congregation of the children of Israel came unto the wilderness of Sin, which is between Elim and Sinai, on the fifteenth day of the second month after their departing out of the land,' &c. In these words we notice three very important points. The first we shall have to dwell upon later, for it seems to witness to us that at the time this record was written, not the mountain that is now called Sinai, but much more probably Mount Serbal, lying further to the north, is to be considered as 'the Mount of the Lord.' Secondly, we find that the Hebrews took a month and fifteen days from their starting out of Egypt to reach the desert of Sin. We reckon as within this time Ayûn Musa, where they celebrated their deliverance from Pharaoh, but in all that time only eight places of encampment are mentioned. This, although it may seem strange at first sight, is easily explained when one considers the circumstances under which they journeyed. From the first station the people would start at an appointed hour. The leaders, the *head-quarters* (if one may use the modern expression), went on as our old Sheikh used to do, and chose the camping-ground, where they awaited the people, a great part of whom could only arrive late, and part of them even only on the following day."

We can understand, too, how an ardent Egyptologist should hail the name *Mafka* or

Tmafka, which the tablets tell him was the ancient name of Wády Maghárah, as a convincing proof of the identity of that place with the hitherto unrecognisable station of Dophkah, but it rather weakens the force of such an argument to be obliged to alter or interpolate the number of stations as given in the Bible, in order to make it fit into the itinerary. But although this identification is geographically improbable, it appears to be based on sound etymological principles; for, as the author tells us,

"In both districts (Sarabit el Khadim and Maghárah) is found the substance maphkat, which gives its name (maphka, or copper country) to the whole mine region. As maphka is frequently written without the final *t*, this *t* is to be considered the sign of the feminine gender; and when this feminine *maphka* is pronounced with the article *t* before the word, it becomes tmaphka, in which we may recognise the Dophka of the Bible."

I would even hazard a conjecture that the name was given to some point upon the coast between Wády Taiyebah and Wády Feirán, where the road from the mines emerged upon the plain, or to the port at which the mineral products, &c., were embarked.

One great objection to Dr. Ebers' theory, which takes the Israelites by way of Wády Maghárah, is that the Nagb Buderah, by which it is approached, must have been quite impassable before the construction of the present road, which is undoubtedly posterior to the Exodus, and is even now impracticable for a large caravan. See *Desert of the Exodus*, vol. i. p. 276.

Dr. Ebers agrees with Lepsius and Birch in supposing the metal *maphka* to have been copper rather than, as Brugsch conjectures, turquoise, and the results obtained by the Sinai Survey Expedition certainly confirm this view.

It would not appear that either Dr. Ebers or his companions were able to communicate very freely with the Arabs, for the two or three Bedawí traditions which he quotes are for the most part incorrect. For instance, he says of the Hammam Firaún that it is so called because "Pharaoh (naturally he of the Exodus time) was condemned, they say, for his sins to be eternally boiled in the burning waters of the mountain." For the real version of the tradition the reader is referred to the 'Ordnance Survey Report,' Notes and Illustrations, part i. p. 65.*

We notice also a rather extraordinary omission in the account of the Red Sea, where, although he gives an elaborate discussion upon the colour of the water and the origin of the name, he curiously enough omits to mention its most common Semitic appellation, Bahr súf, and the red fleecy sea-

weed (súf) which is found in such quantities on its shores.

A rather fanciful and certainly erroneous derivation is that given for Wády Nash. "We encamped under some dates by the well of Nash. This name is undoubtedly derived from the neighbouring copper mines, for this metal is called in Arabic *nahás*." The name of the wady and spring in question is *nash* (*nún, shád, bá*) which means "a sacrificial stone," or one set up as an object of adoration by the ancient Arabs; while the Arabic word for copper is *nahás* (*nun, há, alif, sín*), so that the two words have not the remotest connection with each other.

But these are almost the only blemishes in the book, and they really detract but little from its value, inasmuch as it is not in these general geographical conclusions that Dr. Ebers' forte lies, but in his skilful manner of handling the literary question of the Exodus and in the array of learning which he marshals before the reader.

He has done for this branch of the subject what the Ordnance Survey has done for the physical geography of the country; and his carefully arranged references, with copious quotations from the originals both of inscriptions and passages from ancient authors—furnished as they are, too, with German translations for the lay reader—will in future be, in their way, as indispensable to the Biblical critic as are the counterfeit presentments of the hills and valleys of the peninsula given in the Ordnance maps and photographs. To the latter, indeed, they furnish an invaluable supplement, elucidating many points which want of such special knowledge as Dr. Ebers possesses had made obscure to the members of the Sinai expedition. For instance, the name *Sarabit el Khadim* was long a puzzle to us; and although the first part was plain enough, I was obliged to fall back upon the Bedawin's own explanation of the latter word, viz., that the hill was so called from the black statue of a "servant," *Khádim*, which actually seems to have been discovered there. Dr. Ebers' explanation is that it is derived from the ancient Egyptian *xatem*, a citadel, fortress, &c. This method of looking to hieroglyphic sources for the originals of some of the modern Arabic names of the peninsula is almost new ground, which no one is better fitted to explore than Dr. Ebers. In an able article upon the Sinai Survey in the *Times* of October 2, 1872, a suggestion in a similar direction was made to the effect that the somewhat unsatisfactory name Wády Babá which occurs in the neighbourhood of the mines may have its origin in the hieroglyphic *Beba*, "the cave," which is applied in some of the tablets to the district of Maghárah, the latter modern Arabic and the ancient Egyptian word having both the same signification.

With regard to the situation and extent of the Land of Goshen, Dr. Ebers, combining as he does a profound acquaintance with Egyptology and Biblical lore with a fair knowledge of that part of the country, is a trustworthy guide and a sagacious judge. He had not, as in the case of Sinai, to deal with many conflicting theories and a country the physical aspect of which was almost

unknown except so much of it as lay within the limited area of the ordinary tourist's route. Here he had a comparatively simple country, with abundant allusions in ancient writings, to its towns and boundaries, and a piece of country, too, over which, strange to say, no battle of geographers has yet been fought. The conclusions arrived at are sound, and will do much towards elucidating the history, &c., of the little-known period between the settlement of the Israelites in Egypt and the Exodus.

This country he places on the east of the Delta (1), because the Bible nowhere says that the Israelites had to cross the Nile; (2), because it so relates the history of the Exodus that it could only have taken place from the eastern Delta; and (3), because the Septuagint and the Coptic translators add to the *Goshen* of the text the more particular geographical definition that it is to be found in the district which lies in the eastern Delta, also called by Claudius Ptolemaeus *ρομός Ἀραβία* and in the Septuagint *Ἰσραὴμ Ἀραβίας*. The addition by the LXX. of the words *ἡ τις ἐστὶν ἡ πρὸς τῇ Αἰγύπτῳ Ἀραβία*, and in the Coptic *Ἡ ΓΕΓΕΜΗΓΕ ΤΑΡΑΒΙΑ*, is "not only sufficient of itself to decide the position of the land of Goshen, but indicates that an even more special topographical description may be obtained if we can only get some information about the limits of the *ρομός Ἀραβίας*."

This information, he shows us, is to be obtained both in the Scripture names of towns in Goshen spoken of in the course of the history of the Exodus, as well as in Strabo and Herodotus; the former of whom mentions "Egyptian Arabia" as lying between the Nile and the Arabian Gulf, with Pelusium at its northern extremity; while the latter calls that part of Egypt lying to the east of the Delta "Arabia." The fact that Jacob is brought from Palestine through *Goshen* to the residence of the king (Gen. xli. 28), also points to the fact that Goshen was the first province which a person entering Egypt from the east would touch. The district of Tarabia is bounded "on the south by the Arabian mountains, which extend from the right bank of the Nile, and which here send down many spurs across to the Red Sea, but in the plain between Heliopolis and Arsinoe gradually end in low lines of hills crossing the desert from east to west. The eastern boundary is the extreme point of the Gulf of Suez, and a natural and artificial chain of fortresses." (The lakes and marshes of the isthmus being expressly mentioned by Strabo, as well as the forts, such as Pelusium, which was the northernmost of them.) On the north it was enclosed by the Menzaleh Lake, and a part of the Pelusium coast. Westward it reached as far as the Tanitic arm of the Nile. From physical conditions Tarabia must be divided into two parts, of which the eastern takes the form of a right-angled triangle, the sides of which are drawn from Heliopolis to Suez, from Suez to Pelusium, and from Pelusium to Heliopolis. The second part of Tarabia consists of a strip of fertile land which, never more than six miles wide, cuts through the desert from Bubastis (Zagazig) to the present Timnah Lake. Having determined the limits of Tarabia, and proved conclusively,

* The following is a literal translation of the legend in question as written down by me at the dictation of some of the best authorities among the Towarah Bedawin:—"In the beginning Moses and Pharaoh quarrelled. Then Moses walked down to the salt sea and smote it with his staff, making it a passable road. Over this he went with his people, and Pharaoh came and followed him into the middle of the sea. Now when he was half-way across, Moses said, 'Return, O sea! over what is within thee;' and the sea swallowed up Pharaoh, and they called the place Bahat Firún. Now when the sea drowned Pharaoh he gasped and blew, and a hot spring came up from his breath called Hammam Firún."

as it seems to me Dr. Ebers has done, that Goshen formed a part of that province, it is comparatively easy to define the limits of Goshen itself. This he does as follows:—

"If we take the towns belonging to Goshen," (discussed in detail in the course of the work,) "as fixed points, and as it were throw a net towards all points of the compass so as to take in all the most outlying ones, then we get as the boundary on the east the lakes upon the Isthmus of Suez, and already mentioned in the time of Rameses, and the line of fortifications which stretched out behind them. The southern boundary has the form of the arc of a circle, which unites on the S.W. and N.E. the points Heliopolis, Tell el Jahûdi, Belbès, Pithom, and Rameses. On the west, the extreme points from S. to N. are Heliopolis, Bubastis, Phakusa, and Tanis. Whether we ought to reckon on the north the marsh districts south of the Menzaleh Lake, as forming part of the district, is uncertain. The triangular piece of desert, whose base is formed by the degree of latitude which passes through Heliopolis, and the N.W. side of which lies close upon the line of cities, Heliopolis, Tell el Jahûdi, Belbès, Pithom, and Rameses, belonged to the Arabian province of Tarabia, but it is doubtful whether it ought to be reckoned as part of the province of Goshen, properly so called."

Durch Gosen zum Sinai is a work that may be confidently recommended to Biblical critics. If on some geographical questions the author has not formed an independent judgment, he is on the other hand free from eccentricity, and does not support any of the fanciful hypotheses propounded by certain modern theorists, and his conclusions, where he has good data to go upon, are always sound. The great mass of information, too, which the book contains, is well digested, and the general arrangement of the work such as to make reference to it easy. The style also is good, although the author does occasionally condescend to rather florid and emotional language. Witness the following description of Wady Shellâl:—

"Were I a painter, with the power to illustrate Dante's *Inferno*, I should place my camp-stool here and fill my sketch-book, and then never should I lack subjects for representation of that region of death in these powerful, terrible, indescribably melancholy, ungovernably wild landscapes. One might well believe that all the evil spirits had had a wicked hand in the building of these barren, desert, cruel cliffs. . . ."

Dr. Ebers' work is one which will interest all classes of readers, and it is to be hoped that before long an English translation of it may be forthcoming, in order that it may become more generally known and appreciated in this country. E. H. PALMER.

Biographical and Critical Essays. Third Series. By A. Hayward, Esq., Q.C. (Longmans, 1874.)

MR. HAYWARD has, perhaps unconsciously, described the spirit of his book in his first paragraph.

"There is," he says, "a comic history of England. Why might there not be an anecdotal one, in which the salient points should be placed in broad relief by memorable sayings and striking incidents—by well-chosen traits of valour, virtue, patriotism, eloquence and wit? There is no pleasanter mode of conveying knowledge, no easier mode of impressing it. The most fugitive attention is caught by anecdotes; the most volatile

mind retains them so long as it retains anything; and none but the shallowest will miss the moral they point, the reflexions they suggest, or the conclusions they justify."

It must be acknowledged that if this is to be the history of the future—if we are to care more for what men said than for what they thought and did, we could not wish to be under a pleasanter teacher than Mr. Hayward. An inexhaustible knowledge of good stories, combined with the rarer power of telling them well, and a great familiarity with the lighter literature of modern times, make these essays very enjoyable reading for an idle hour. Whether they have cost Mr. Hayward much thought, or whether that which has not cost the author much thought can be of any real service, are questions which it is perhaps as ridiculous to ask as it would be to ask whether a moss-rose were good to eat.

And yet there are subjects touched here which seem to demand more serious treatment. Take, for instance, Lanfrey's *History of Napoleon*. Who has read that book without asking himself whether it tells not merely the truth but the whole truth? We feel as we turn over the pages, with their terrible burden of accusation, that we have the work of an advocate; an advocate of the righteous cause, if you will, but still an advocate. The feeling may be entirely without foundation, but it is almost impossible to conceive anyone seriously reading M. Lanfrey's pages without entertaining it to a greater or less extent. Such a thing, however, has evidently never entered into Mr. Hayward's mind. Page after page he contents himself with reproducing in the most telling way the story which M. Lanfrey has told already. Of independent criticism there is not a shade. All that Mr. Hayward has contributed of his own are a few quotations from Scott and Byron, Pope and Corneille, and a very remarkable criticism (p. 237) on a saying of M. Thiers, that if Napoleon had found a Desaix on the battle field of Waterloo, he would have preserved the Empire, and France its ruling position amongst the powers of Europe.

"Give the sentence a turn"—says Mr. Hayward—"if the First Consul had not found both a Desaix and a Kellermann on the battle field of Marengo, he would never have founded an empire to be preserved, and France might have obtained long ago the position for which she is still struggling, of a free as well as a great nation."

It is beyond doubt that if Napoleon had been defeated at Marengo he would never have founded an empire. But it must require a long course of anecdotal history to lead any one to imagine that France would have been capable of freedom if Napoleon had been got rid of fifteen years before the defeat of Waterloo. The more reasonable supposition is that the generation which cringed before Napoleon would have looked about for some other idol to take his place. It is not upon record that the men who witnessed the assassination of Cæsar abstained from bowing down before Augustus.

A writer, however, who copies M. Lanfrey, is in a far better position than a writer who copies M. Thiers. Let us see what Mr. Hayward has to say on a nobler theme than the life of Napoleon, on *The British*

Parliament: its History and Eloquence. We shall perhaps be accused of hypercriticism if we suggest that stories about the reign of Charles II. have nothing whatever to do with the British Parliament, no such body being known to history till after the Union with Scotland. But it is a pity almost that Mr. Hayward has not restricted himself within the limit of time after which a real British Parliament existed. His knowledge of the earlier history and eloquence of the English Parliament seems to be of the most elementary kind. He is indeed tempted into an argument to disprove a foolish statement of Hume's, which might nowadays have been left to disprove itself, to the effect that "the whole discourse and language of the moderns, i.e., the men of the seventeenth century, were polluted with mysterious jargon, and full of the lowest and most vulgar hypocrisy." In answer to this Mr. Hayward quotes, amongst other things, two extracts from the speeches of Seymour and Philips, in which one actually refers to Herodotus, and the other to Livy, two extracts which, even to the italics, are carefully copied from Hume himself. Of Sir John Eliot, or Mr. Forster's biography of him, Mr. Hayward does not appear ever to have heard, or he would hardly have thought it necessary to point out the fact as something worth noting that Herodotus and Livy were known to members of the House of Commons in 1628, and it is needless to say that an essay on the eloquence of Parliament which knows nothing of Eliot is singularly defective.

Perhaps, however, it is dealing hard measure to Mr. Hayward to ask him to be an historian. His *forte* is story-telling. His anecdotes doubtless are not very new, and one has, of course, heard before of the elder Pitt's speech beginning "Sugar, Mr. Speaker—" of Lord Palmerston's *Civis Romanus*, and of Sheridan's joke when Burke flung his dagger on the floor of the house: "The gentleman has brought us the knife, but where is the fork?" But if the stories are for the most part old, there are plenty of them, and the interest is never allowed to flag. Here, for instance, is one about the economical ways of Mr. Carlyle's hero, Frederick William I. of Prussia (p. 105):—

"'Touch not, taste not,' was a maxim which one of the royal suite, high in favour, neglected to his cost. A barrel of oysters was announced, price ten dollars. The King, who liked oysters, but was staggered by the cost, asked Von Kleist if they were likely to turn out good. 'Excellent,' was the reply; and, on being asked how he knew, he stated that, passing through the kitchen as they were opening the oysters, he had tasted one. 'Very well,' said the King; 'he who has eaten one may eat them all, and repay me the money they have cost.' He compelled Von Kleist to take the bargain off his hands."

Or, nearer home, concerning Plunket (p. 380):—

"A very ugly old barrister, arguing a point of practice before him, claimed to be received as an authority. 'I am a pretty old practitioner, my lord.' 'An old practitioner, Mr. S.'"

If there is not much instruction to be got out of the book, there is a great deal of amusement, and probably Mr. Hayward holds the opinion which Albert Smith used

to propound at the Egyptian Hall, that the British public wants to be amused, not to be instructed. So far as this is the case, we cannot wish the British public in better hands.

SAMUEL R. GARDINER.

NEW NOVELS.

Argus Fairbairn. By Henry Jackson.

(London: Sampson Low & Co., 1874.)

Too Late. By Mrs. Newman.

(London: H. S. King & Co., 1874.)

Mrs. Greville. By Ursula.

(London: Chapman & Hall, 1874.)

Vicissitudes of Bessie Fairfax. By Holme Lee.

(London: Smith, Elder, & Co., 1874.)

It is a fact well known to every observer of human nature, that there are at the present moment large numbers of estimable persons, both male and female, who never willingly and of their own motion open any book except a novel. To these persons a due and regular supply of fictitious matter is an absolute necessity, artificial it may be, but still a necessity. The average consumption of the healthy adult naturally varies, according to rate of reading, hours of leisure, and so forth; it may perhaps be estimated at from fifteen hundred to two thousand pages per week, or from two to four ordinary novels. And it will be noticed by any one who studies the advertisement sheets of literary journals, that this demand is duly supplied either by the bounty of a gracious Providence, or by the operation of the laws of the dismal science, or both. Now it would be obviously absurd to demand from the purveyors of this sort of provender, any literary or artistic excellence. We might as well expect the contractor to a workhouse or a regiment to furnish his rations each separately elaborated after the fashion of Gouffé or Francatelli. Not that the consumers are absolutely insensible or indifferent. We know several persons of this class who would really prefer *Old Kensington*, or *A Princess of Thule*, to the books whose titles head this article. But still literary excellence is not the real question. What is required is something to occupy a given number of hours. And we outsiders may be thankful if this something is not utterly abhorrent to us in language, morals, or taste.

Argus Fairbairn may reasonably claim to provide some such negative ground for thankfulness. The story is fluently and pleasantly told, the moral is unexceptionable and not too forcibly urged, and the book is singularly free from the slips in matters of fact and phrase which one looks for in the average novel. Certainly it would be better for Mr. Jackson not to talk of the "Senate House" at Oxford; it disturbs us too a little to find a lady, supposed to be of unusual culture and refinement, saying, "You must have practised a deal," and in one passage the author has tripped on those terrible *offendicula* the verbs *lie* and *lay*. But these are exceptions, and, as a rule, Mr. Jackson has paid his readers the unusual compliment of writing his books in something like English. Positive praise, however, *Argus Fairbairn* cannot expect. We have said that the story is fairly told; but, unluckily, there is hardly more story to tell than there was in the case of the knife-grinder. A reading party in Wales;

a seduction; a cruel mother who intercepts letters; a child born on shipboard, and adopted not too cheerfully by the man who afterwards marries the victim, are the time-honoured ingredients which go to make up the introduction. The story itself turns on the real father's earnest and repeated efforts to benefit his son, as soon as he discovers the latter's existence and identity,—efforts which are baffled by the young gentleman's insanely unreasonable restiveness and ill-temper. The heroine—if there is a heroine—is a certain Miss Meadows, a singer, to whom Mr. Fairbairn engages himself. As originally sketched, she resembles rather too palpably the immortal Emily Fotheringay, but the outline is unsteadily filled in, and the result vague and inconsistent. Altogether, there is certainly a deficiency of matter, though there is hardly a superfluity of art.

Mrs. Newman's novel is an eminently feminine book. The hero, Nevill Lyfad, heir—subject to his aunt's pleasure—to a large fortune, is crossed by this aunt in an attachment to a pretty, underbred, superficially refined, internally diabolical young woman named Blanche Arnold. He then tumbles down a cliff, is nursed by the coast-guard, and marries out of pique Margaret Dunn, a coast-guard's daughter, miraculously beautiful, and capable of transforming herself into a lady in a wonderfully short space of time. Enraged by this, the aunt devises the property to a neighbouring *vaurien*, Sir Frederic Shelborn, and immediately has a paralytic stroke, which deprives her of speech and other faculties for the short remainder of her life. The will being secret, Nevill is still regarded as heir. Blanche flirts with him outrageously, and manages to let Margaret know why her husband married her. Margaret disappears, and is supposed to be drowned. Nevill marries Blanche, the aunt dies, the will is read, and Blanche finally elopes with Sir Frederic, whom she has always loved. Nevill recovers his lawful wife, and, ultimately, the estates. All this is told in a manner spirited enough, and fairly interesting; but, unfortunately, there is a painful under-current of "purpose." The purpose is to show the weakness and folly of well-born persons. And when we have said that Lady Shelborn, the typical aristocrat, is introduced as saying on the occasion of her daughter's unexpected engagement, "I had not even the pedigree at hand to show him," it will be seen that Mrs. Newman's shafts are not very lethal. Perhaps the worst fault of the book is a tendency, often observable in novels written by ladies, to make the women either impossibly good or else improbably bad. But it is, on the whole, harmless enough, and will slay its appointed hour or two without any great offence.

Ursula, who is, she tells us, "a somewhat Sister of Mercy," finishes her third volume with a touching plea of "first fault," intended, doubtless, to soothe the savage breast of the critic. The plea, whether valid or not, is certainly by no means superfluous. The book presents us with the edifying history, from cradle to grave, of a certain Eveline Greville, who is in the first volume *schöne Seele*, in the second *ange déchu*, and towards the end of the third Sister of Mercy. The reader is prepared for the transition from

the first to the second stage, by the remarkable manner in which the heroine—who is a widow, fabulously lovely, and just twenty-five—receives and encourages the visits of married men, entirely ignoring and ignored by their wives. These happy Benedicts call on her at all hours of the day and night, dine and spend the evening *tête-à-tête* with her, and even pay her long visits at her country house, without any companion, duenna, or other intrusive third person to check the flow of soul. Married man No. 1—a virtuous person overcome by his feelings—makes a declaration as early as p. 174 of vol. i., and is duly snubbed and dismissed. Mrs. Greville is greatly shocked, but fails entirely to draw the obvious inference, and is even more familiar with married man No. 2. He unluckily is not at all virtuous, and with him she very soon "goes to the devil, as" Ursula tells us "men express it." But she does not find the devil pleasant company, and her moral tortures are described with wearisome and rather sickening minuteness. Finally, after being cast off, in a somewhat brutal and improbable manner, by her lover, and having been reduced to poverty (a thousand a year and a house), she retires from the world and joins a sisterhood. The characters, who talk a great deal, quote with much freedom and cap each other's quotations with appalling facility. Regardless of Lord Chesterfield, they pour forth proverbs in all European languages. Nor is the writer in her own person at all wanting: she indulges in pages of reflections and similes which might have been new to Seth or Lamech: the spider and the fly, for instance, have half a page to themselves; and minor absurdities of incident and diction are as plentiful as blackberries.

From such a book it is a great relief to turn to the last on our list, the *Vicissitudes of Bessie Fairfax*. Bessie's adventures are neither tragical nor tremendous, but they are well and spiritedly told, and shew what good treatment may make out of a very slight matter. The heroine is an orphan brought up by her stepmother and the man whom her stepmother afterwards marries. When she is about fifteen, family circumstances induce her grandfather, after quietly ignoring her since her birth, to claim her with the intention of making her his heiress. The rest of the story may be found out from the book, which is quite worth reading. Bessie herself is a pleasing damsel, quaint in ways and speech; and quite as individual as one has any right to expect. Her grandfather is not bad, nor is Lady Latimer, the beneficent but tyrannic Lady Bountiful of Beechhurst. The two heroes, Mr. Cecil Burleigh, the high-born lover, and Mr. Harry Musgrave, the squire of low degree, are perhaps a little wooden, but there are some very fair supernumeraries. Perhaps the chief merit of the book is the setting. The scenery and humours of the New Forest, of Caen and Bayeux, and of Yorkshire, whither Bessie is successively taken, are sketched with unfailing liveliness and spirit. Altogether, though *Bessie Fairfax* will hardly justify Holme Lee's admirers in dancing round Miss Austen's bust, and shouting "Enfoncée, Jeanne, enfoncée!" it is, never-

theless, a good sound piece of work, well adapted to its purpose, and creditably turned out by a practised craftswoman.

GEORGE SAINTSBURY.

MINOR LITERATURE.

Life Wanderings and Labours in Eastern Africa. By C. New. London: H. S. King and Co. —The tract of country traversed by Mr. New in his wanderings, both as missionary and explorer, in Eastern Africa, is almost unknown to Europeans. It is situate between 5° 50' and 2° lat. south of the equator, and comprises a land rich in vegetation and animal life, with an agreeable climate, many natural advantages, and needing only civilisation to develop all its resources. Mr. New was in many places the first European who had ever been seen by the natives, and his experiences cannot, therefore, fail to be of value. He left England, in 1862, at the instance of the Assembly of the Free Churches which met at Bristol, and for upwards of ten years he laboured as missionary in Eastern Africa. He gives us a very melancholy picture of Zanzibar, demoralised as it has been by the slave trade, and he warns us that though Sir Bartle Frere's mission for the suppression of slavery has been successful so far as the treaty is concerned, yet there is much hard work yet to be done before the trade is effectually and finally stamped out. He considers that one of the greatest aids towards the extinction of the evil would be to establish a Christian colony at Mombasah, a place eminently fitted by natural advantages of situation and climate to become the chief port on the East African coast. His first journey to Muika leads us into a land called indeed the "wilderness," but full of fertile valleys producing abundant crops, and magnificent highlands rich in vegetation and abounding in game. The inhabitants, called Wanikas, are a pastoral and agricultural people, idle as most Africans are, possessing scarcely any idea of a superior Being, much addicted to drinking, but yet distinguished from other tribes by their intense family affection, and the great respect shown by them to the aged of either sex. One curious superstition they have, is their reverence for the hyaena. The death of one of these animals throws the whole country into mourning, and its funeral ceremonies surpass even those held on the death of a great chief. Mr. New recommends Muika to the English settler as possessing unusual advantages, both agricultural and pastoral, together with an abundant supply of labour that the Wanikas themselves are always ready to furnish.

In 1866, Mr. New received permission from the Gallas to visit their country, and he penetrated as far as Gubisu, a small town on the shores of Lake Ashako Babo. He was met by his Galla guides at Malinde, a hamlet on the sea coast, where the horrors of slavery there witnessed were so terrible that even his Galla companions urged him to leave the place. The whole hamlet resounded night and day with the cries of the miserable slaves, who were constantly beaten to death, in the market-place, for the most trivial faults. Once in Galla land, Mr. New has again to tell us of wonderful fertility, exquisite scenery, beautiful lands, abundance of game. In some parts the travellers suffered tortures, from dense clouds of mosquitoes, which made their lives a burden to them; in others they were tried by want of water. This last want is, however, partially provided against by a wonderful contrivance of nature, to be found in those tracts most liable to drought. A plant, called by the Gallas "Obe," a species of cactus, grows there, the stem of which develops into a huge bulb, twenty feet high, and as many thick, guarded by gigantic spurs or thorns, and consisting of a substance resembling a turnip, but so succulent and juicy that one large plant is sufficient to supply a score of cows with all the water they need. Strange to

say, human beings cannot eat it with impunity, but to the Gallas, with their numerous herds, it is an inestimable boon. Mr. New found the Gallas, ferocious as they are themselves, in a state of abject terror of the Masai, a warlike tribe inhabiting the lands in the far west, the scourge and at the same time the admiration of all the tribes living on the eastern coast. Like the Highlanders of old, their habit is to swoop down on all their neighbours' flocks and herds, levying black mail right and left, and deterred by nothing but a river or a large expanse of watery marsh, neither of which they have ever been known to cross.

By far the most novel part of Mr. New's book consists of the account of his journey to Kiliman-yaro, or the equatorial snow mountain, the very existence of which had long been a mooted question with geographers. In 1863 Mr. New had met at Zanzibar the Hanoverian traveller, Baron von der Decken (afterwards murdered in Somali Land by the natives), who had seen Kiliman-yaro, but had failed twice in his attempts to reach the snowy region. His account had filled Mr. New with the desire to succeed where he had failed, but various impediments prevented his starting till July 11, 1871. We refer our readers to the book for the detailed account of the ascent, for it is well worth their perusal. Suffice it to say, that though baffled once by bad weather, Mr. New succeeded at last in reaching the region of eternal snow alone, his followers giving out at different stages on the ascent. He brought back to his astonished followers pieces of the frozen snow. This they instantly seized, resolving to carry it to the coast and sell it as medicine, and were much chagrined when they found at the foot of the mountain nothing but water in their calabashes. The author's account of the capabilities of Africa is so very favourable and encouraging, that, if it be really justified, we cannot but feel depressed at the thought that so rich and fair a land should now be lying comparatively useless, uninhabited save only by tribes of savages. Signs are not wanting, however, that efforts will be made by England to civilise and develop this region, so highly favoured in many respects.

Mr. New has devoted a chapter to the explanation of the old story of his connection with the Dawson Livingstone expedition. In our opinion, this had far better have been omitted.

A. EUAN SMITH.

MR. HALLIWELL'S SHAKSPEARE DISCOVERIES.

LORD CHAMBERLAIN'S Records, No. 86, turned topsy turvy, leaf 43. "The King's Players."—It is a good old maxim that one mustn't look a gift horse in the mouth; and although my private opinion is, that any man who keeps secret for four years facts of importance relating to SHAKSPEARE, ought to stand in a sheet, with ashes on his head, before the ACADEMY Office for four days and four nights, yet I am willing publicly to return thanks to Mr. Halliwell for making known the reference which has enabled me (by Sir T. Duffus Hardy's kindness) to read the MS. of the copies of six documents that he, Mr. Halliwell, has lately printed, and of which he has consented to issue shortly a few copies before the first part appears of his new collections of materials for Shakspeare's Life. The Record Office volume containing these six copy documents is a thin paper folio from the Lord Chamberlain's Office, bound in vellum, and labelled on the upper cover "Presentations and Warrants in the years 1631, 1632, &c." Its contents are evidently genuine, not the modern shams that the documents of somewhat like kind invented for Lord Ellesmere's library were. There is no question here of a Perkins folio corrector; no need for Mr. Maskelyne's microscope to find pencil tracings underneath the ink words; no clots of black, with faint ink around, &c. Mr. Halliwell hasn't made a "mistake" of that kind.

These documents, then, are copies of two petitions, of actors, and two answers of owners, to the

Lord Chamberlain (with his first Decree, and final Order of Reference), and represent a suit in Chancery, against the lessees of the Globe Theatre and the owners of the Blackfriars, in 1635, nineteen years after the death of the great actor and poet who has carried the theatres' names all over the world. The judge is the Lord Chamberlain; and his power to enforce his decrees consists, on the one hand, in his power of suspending any disobedient actor from acting in the king's company, and on the other, in his control over the judge of the Court of Requests, whom he can exhort to take the name of any rebellious lessee out of the extended lease of the Globe Theatre which that Court is about to order Sir Matthew Brand, the freeholder, to grant to the then lessees of the Globe.

The state of the case was this. James Burbage, the father of Cuthbert Burbage and Richard Burbage (the great tragedian of Shakspeare's time, and Shakspeare's friend) was the first builder of theatres in London. He started by building "The Theater." Then after his death (about 1594) his sons, Cuthbert and Richard, took a lease of some land in Southwark; on it built the Globe, in 1599, Mr. Halliwell says; and moved from "The Theater." To get their Globe company together, and secure the pay of the chief members of it, the Burbages entered seemingly into a twenty-one years' partnership with certain actors, "those deserving men, SHAKSPEARE, HEMINGS, CONDALL, PHILIPS, and others, partners in y^e profits of that they call the House," which appears to be defined in 1635 as " (without any defalcacion or abatement at all), a full moyety of the whole gaines arising thereby, [that is, from the galleries and boxes, ... & the tiring house dore at y^e Globe], excepting the outer dores" (no doubt the pit). These partners were evidently called "Houskeepers," and paid for rent and repairs of the building; but whether Shakspeare and Philips were of their number, we do not know. No doubt Hemings and Condall were, as well as Cuthbert and Richard Burbage, for in 1635 we find the names of them or their representatives in the list. The other half of the profits of the performances, and the takings at the outer doors, went (in 1635, at least) among all the actors (His Majesty's servants) equally, after payment "of all wages to hired men, Apparell, Poetes, lightes, & other charges of the Houses whatsoever." Well, the Globe (the thatch, or winter theatre) was burnt down on June 29, 1613, the thatch having caught fire from the wadding of the small cannon shot off during the performance of *Henry VIII.* (according to Hawes and Lorkin), or *All is True*, relating to Henry VIII. (according to Sir H. Wotton). After this, the "Houskeepers" of the Globe evidently got a new lease, seemingly for twenty-five years, of its site from the freeholder—who in 1633 was Sir Matthew Brand—and rebuilt the theatre, at a cost of 1,400*l.* This new "House of the Globe" was "formerly," say the three complaining actors in 1635, "divided into 16 partes, whereof Mr. Cuthbert Burbidge and his sisters had 8, Mrs. Condall 4, and Mr. Hemings 4." Then two actors "Mr. Taylor and Mr. Lowen" were long since admitted to purchase 4 partes betwixt them from the rest (vizt) 1 part from Mr. Hemings, 2 partes from Mrs. Condall, and half a part a peece from Mr. Burbidge and his sister, and "the 3 partes remaining to Mr. Hemings were afterwards, by Mr. Shanks, surreptitiously purchased from him." Then "the said Houskeepers in the name of his Maiesties servantes" sued and obtained "a decree in the Court of Requestes against S^r Mathew Brand for confirmation vnto them of a lease paroll for about 9 or ten yeeres," of the Globe, or as Shanks says, "for the adding of nine yeeres to their lease, in consideration that they [the Houskeepers] and their predecessors had formerly been at the Charge of 1400 *l.* in building of the sayd House vpon the burning downe of the former." It is thus evident that in this case the "Houskeepers" were looked on as the actual lessees of the property, and were to

have the new lease from Sir Matthew Brand granted either to them or to trustees named by them.

We must now turn back to the Blackfriars theatre. This, James Burbage the "father purchased . . . at extreme rates, and made it into a playhouse with great charge and trouble" (1576 is the date given by Dyce for its building). Burbage the father did not at first work the Blackfriars with his own company, but leased it "out to one Euans, that first sett vp the Boyes commonly called the Queene's Maiesties Children of the Chappell." Then, after some time, "the boyes growing vp to bee men," Burbage's sons bought back Evans's lease, and again, to make up a company for the Blackfriars, "placed [there] men Players, which were HEMINGS, CONDALL, SHAKSPEARE, &c.," evidently again taking them into partnership for a term in the profits of the House, but retaining the freehold in their own Burbage family. What the respective shares of the partners were we do not know, nor whether Shakspeare was a "Houskeeper" in the Blackfriars; but we get positive evidence, from James Burbage's son and son's widow, of the fact we all were certain of before without evidence, namely, that Shakspeare was a partner in the profits of the Globe and the Blackfriars. And that is all the direct evidence as to Shakspeare that these documents contain. Well, by 1635, the "Houskeepers" of the Blackfriars Theatre are seven in number (Shankes having bought Hemings's shares), while those in the Globe are six; and the following table shows the state of both houses:—

shares in the Globe.

		Of a lease of 9 yeeres from our Ladyday last, 1635, not yet con- firmed by Sir Matthew Brand to be taken to freeholders.		
Burbage	24		<i>Blackfryers</i>	Shankes 2
Robinson*	24			Burbage 1
Condall	3			Robinson 1
Shankes	3			Taylor 1
Taylor	2			Lowen 1
Lowen	2			Condall 1
				Underwood 1

The ownership of the "houses," and therefore the main part of the profits, having thus got partly into the hands of non-actors, Mrs. Robinson and Shankes, three of the actors—"Robert Benefield, Heliard Swanston, and Thomas Pollard"—appeal to the Lord Chamberlain to set matters on a fairer footing, and order a compulsory sale to them, at a reasonable rate, of three shares in the Globe—one of Cuthbert Burbage, one of his sister-in-law, Winifred Robinson, and one of Shankes; and one of Shankes's shares in the Blackfriars. The prayer of the actors' petition, the Lord Chamberlain (Philip, Lord Pembroke, the brother of the supposed "W. H." of Shakspeare's sonnets) grants. But his order is not at once obeyed, and the actors have to put in a second petition. Cuthbert Burbage and his sister answer it, and entreat that they may be only obliged to part with one share instead of two. As to Shankes, he answers too, and fights manfully for his rights as purchaser and proprietor; but he ultimately gives in to the Lord Chamberlain's order, or at least offers a compromise. In return, he says, the actors keep him off the stage; so he, in his turn, appeals to the Lord Chamberlain, who refers the matter to Sir H. Herbert, Sir John Finett, and his own solicitor, Daniell Bedingfield, and desires them to "sett downe a proportionable & equitable summe of money to bee payd vnto Shankes for the two partes, which hee is to passe vnto Benfield, Swanston, and Pollard." As no mention is made here of the Burbages' shares, it is probable their offer to sell one share was accepted by the three actors.

These documents then are valuable (1.) as I have said, for their rendering certain the fact of Shakspeare's partnership in the profits of the Globe and Blackfriars Theatres; (2.) for the light they throw on (a) the relation between actors and "Houskeepers," and their respective shares of profits; and (b) the admirable contempt which the Lord Chamberlain shows for "the rights of

property" as against the claims of labour: communism and confiscation his decree would be called now; (3.) for the status they show the "poetes" to have held—"wages to hired men, Apparell, Poetes, lightes, and other charges"—(in one of Mr. Halliwell's other accounts these "Poetes" get 10s. a week between them; yet surely a poet like Shakspeare, a "partner," was not of this class;) (4.) and mainly, I think, because they give us notice of the suit between Cuthbert Burbage and the other "houskeepers" and Sir Matthew Brand in 1633 for the renewal of the lease of the burnt and rebuilt Globe Theatre. The Petition or Bill of the plaintiffs, with their depositions, ought to show the interest, if any, of Shakspeare in the theatre, and trace the sale of his shares, if he had any. I look forward with the greatest eagerness and hope to the speedy finding of the records of "Burbage v. Brand," for which Sir T. D. Hardy and Mr. Bond have kindly ordered the arrangement of the eighty-five big bundles of Court of Requests papers in Charles I.'s time. If the records contain what I expect, we shall indeed have cause to be grateful to Mr. Halliwell, and we will forgive him for keeping us waiting four years for the result.

F. J. FURNIVALL.

The most important document of the six is No. 5, the Petition of Cuthbert Burbage (old James the father's eldest son), Winifred Robinson, the widow of Richard Burbage (old James's younger son, and Shakspeare's friend), and William Burbage (Richard's son), in answer to the complaint of the three dissatisfied actors, Robert Benefield, Heliard Swanston, and Thomas Pollard. This document shows cause why they, the Burbage family, should not be made to part with two of their shares, though they were willing to part with one. The Petition is as follows, on leaf 49 back, and leaf 50 front, of the MS. turned top downwards.

"To y^e Right Hon^{ble} PHILIP, Earle of Pembroke & Montgomery, Lord Chamberlaine of his Maiesties Houshold.

"Right Hon^{ble} & our singular good Lord. Wee, your humble supplantes, CUTBERT BURBAGE & WINIFRED his Brothers wife, & W^m his sonne, doe tender to your hon^{ble} consideration, for what respectes & good reasons wee ought not, in all charity, to bee disabled of our liuelyhoodes by men soe soone shott vp, since it hath bene the custome that they should come to it by farre more antiquity and desert, then these can iustly attribute to them selues. And first, humbly shewing to your honor the infinite Charges, the manifold law suites, the leases expiration, by the restraints in sicknes times, & other accidentes that did cutt from them the best part of the gaines that your honour is informed they have receaued.

"The father of vs, Cutbert & Richard Burbage, was the first builder of Play howses, & was him selfe, in his younger yeeres, a Player. The Theater, hee built with many Hundred poundes taken vp at interest. The Players that liued in those first times had onely the profits arising from the dores; but now the players receaued all the commings in at the dores to them selues, & halfe the Galleries from the Houskeepers. Hee built this house vpon leased ground, by which meanes the Landlord & Hee had a great suite in Law,* & by his death, the like troubles fell on vs, his sonnes; wee then bethought vs of altering from thence, & at like expence built the Globe, with more summes of money taken vp at interest, which lay heavy on vs many yeeres; & to our selues wee ioyned those deseruing men, SHAKSPEARE, HEMINGS, CONDALL, PHILIPS, and others, partners in y^e profittes of that they call the House; but making the Leases for 21 yeeres hath been the destruction of our selues and others; for they dyeing at the expiration of 3 or 4 yeeres of their Lease, the subsequent yeeres became dissolued to strangers, as by marrying with their widdowes, & the like by their children.

"Thus, Right Honourable, as concerning the Globe, where we our selues are but Lessees. Now, for the Blackfriars, that is our inheritance; our father purchased it at extreme rates, & made it into a playhouse with great charge and trouble; which after was

leased out to one Euans, that first sett vp the Boyes commonly called the Queene's Maiesties Children of the Chappell. In proceesse of time, the boyes growing up to bee men, which were VNDERWOOD,* FIELD, OSTLER, & were taken to strengthen the Kings service, & the more to strengthen the service, the boyes daily wearing out, it was considered that house would bee as fit for our selues, & soe purchased the lease remaining from EVANS with our money, & placed men Players, which were HEMINGS, CONDALL, SHAKSPEARE, &c. And RICHARD BURBAGE, who for 35 yeeres paines, cost, and Labour, made meanes to leaue his wife and Children some estate. (& out of whose estate soe many† of other Players and their families haue benee mayntained,) these new men, that were neuer bred from Children in the King's service, would take away, with Oathes & menaces, that wee shall bee forced, & that they will not thanke vs for it; soe that it seemes they would not pay vs for what they would haue, or wee can spare, which, more to satisfie your honour then their threatening pride, wee are for our selues willing to part with a part betwene vs, they paying according as euer hath benee y^e custome, & y^e number of yeeres the lease is made for.

"Then, to shew your Honour against these sayings, 'that wee eat the fruit of their Laboures,' Wee referre it to your honours iudgement to consider their profittes, which wee may safely maintaine, for it appeareth by their owne Accomptes for one whole yeere last past, beginning from WHITSON MUNDAY, 1634, to WHITSON MUNDAY, 1635, each of these complainantes gained severally, as hee was a Player, and noe Houskeeper, 180^l. Besides, Mr. Swanston hath receaued from the Blackfriars this yeere, as hee is there a Houskeeper,† about 30^l, all which, being accounted together, may very well keep him from starveing.§ Wherefore your honours most humble supplantes intreats they may not further bee trampled vpon then their estates can beare, seeing how deely it hath benee purchased by the infinite costs and paynes of the family of the BURBAGES, and the great desert of RICHARD BURBAGE for his quality of playing, that his wife should not sterue in her old age; submitting our selues to part with one part to them for valuable consideration; and let them seeke further satisfaccion else where (that is) of the Heires or assignes of Mr. HEMINGS & Mr. CONDALL, who had thoirs of the blackfriars of vs for nothing: it is onely wee that suffer continually.

"Therefore, humbly relying vpon your honourable Charity in discussing their clamour against vs, wee shall, as wee are in duty bound, still pray for the daily increase of your honours health and happines."

NOTES AND NEWS.

THE editorship of *Punch* has been offered to Mr. Tom Taylor.

ARCHDEACON TROLLOPE, President of the Associated Architectural Societies, has lately presented a complete series of their Reports and Papers to the Archiepiscopal Library, Lambeth Palace. The proceedings contain valuable architectural and archaeological descriptions of churches and antiquities in the counties of York, Lincoln, Worcester, Leicester, Northampton, &c.; and as some of the volumes are becoming very scarce, the donation is one of more than ordinary importance. Our readers will remember that the Lambeth Library is open every Monday, Wednesday, and Friday, from 10 a.m. to 3 p.m.

MESSRS. VIRTUE & Co. will immediately publish in 4to. size *The Scoti-Monasticon or Ancient Church of Scotland*, by Mr. Mackenzie Walcott. It contains Historical, Legendary, and Archaeological Introductions; accounts of all the Cathedral, Conventual, and Collegiate Churches and Hospitals; episcopal, abbatial, and capitular fasti; and a

* He has a share in the "Blackfriars." See the list above.

† Leaf 51.

‡ This is not shown by the table of shares on leaf 45 of the MS. printed above. Perhaps Shankes had bought Underwood's share.

§ This is sarcastic, but must have been true. If money was worth five times its present value, Swanston's income was equal to 1,050*l*. a year now. And we can understand how Shakspeare saved money.

* Richard Burbage's widow. She had married again.

* Mr. Halliwell has copies of all the many documents in this suit.

parochiale with the ancient dedications. It will embrace also illustrations and ground-plans.

MR. HY. CROMIE, of Cheltenham, has now undertaken the whole of the Ryme Index to the Ellesmere MS. of Chaucer's Canterbury Tales, Mr. Furnivall having lost the portion of the work that he prepared last year.

FOR Mr. Fleay's Papers on *Pericles* and *Timon*, the New Shakspeare Society will print separately such parts of these plays as Mr. Fleay assigns to Shakspeare.

MR. HALLIWELL has found a drawing of the original Globe theatre in Southwark, where Shakspeare acted, and which was built in 1599. The only engraving heretofore known is that of the rebuilt theatre of 1613.

MISS ELIZABETH P. PEABODY, in a letter to the Boston *Commonwealth*, says, "Mr. Hawthorne never drew portraits in his novels, not being intent upon character-drawing, but only upon illustration of great spiritual truths." In the case of Hilda in the *Marble Faun*, he borrowed one trait, and one only, from life; and in connection with the *Blithedale Romance* he told Miss Peabody that, whenever he referred to a real person, he gave the real name, as in saying that, "in one particular Zenobia reminded him of Margaret Fuller, though so different in all else."

THROUGH the courtesy of Sir W. C. Trevelyan we have been enabled to see a prospectus which anticipates by more than fifty years the scheme for publishing Icelandic Sagas relating to the British Isles, which we mentioned last week as about to be carried out by the Treasury, under the editorship of Mr. G. Vigfusson. It was drawn up at the request of Sir W. C. Trevelyan by Professor Finn Magnussen, in 1821, under the form of a list of *Scriptores Septentrionales Rerum Britannicarum Mediæ Aevi*. The catalogue includes much of great interest which, at all events for the present, will lie outside the range allowed to Mr. Vigfusson. It contains the heroic sagas, such as the *Tristram ok Isond Saga* and the *Saga Artus Bretla-Konungs*, and even some Catholic writings, which latter may well wait for some unborn editor. Some of the works suggested by Professor Finn Magnussen have since been brought out by the *Svenska Fornskrift Sällskap*.

A FURTHER instalment of Prosper Mérimée's correspondence is about to be published, and will undoubtedly be welcome to all who cultivate the almost obsolete art of letter-writing. The late Academician was nearly as untiring a correspondent as M. Thiers or Barthélemy St. Hilaire. The promised letters are addressed to a literary colleague, and exhibit rather more plainly than the epistles to the *Inconnue*, the hard, cynical and somewhat coarse side of the writer's character. It is no longer the courtly satirist playing an academical St. Preux to a very modern and materialistic Julie; but a frank sceptic recounting without reserve or equivocation his impressions of men and things. The correspondence opens in 1849, and in the very first lines it is evident that Mérimée had already adopted the passive rôle of the philosophic spectator which neither *Sénat* nor Academy could afterwards make him abandon. "We are at Paris nearly as reactionary as you Bordelais. The loungers have ceased to care for the Republic; but, believe me, they will do nothing to overthrow it. If it falls by itself, or is pushed from behind, they will make no effort to pick it up, but be rather pleased to be led by a government they can laugh at." A little further on, a love-story that seriously influenced Mérimée's life is mixed up with learned dissertations on the formation of languages and dialects: "I had a hot discussion the other day with M. Cousin at the Academy. I upheld that many French words have two origins, or, to speak more correctly, that there are words of different meaning, Latin or German, that have passed into French with a similar pronunciation and orthography. I cited *tourbe*, 'canaille,' from *turba*

and *tourbe*, 'peat,' from the German *turbe*; *sûr* from '*securus*,' and *sur* from '*sûr*,' &c." Mérimée never missed an opportunity of ridiculing poets and poetry: "Je me délie toujours des poètes. La rime leur fait dire tant de choses malgré eux." Marriage, death, political questions, all are treated by the "parfait sceptique" with a laughing Voltairian bitterness that no French writer has been able to imitate, though perhaps a score have essayed. This is the way he announces an illness which almost proved mortal: "J'ai failli crever en Provence, il y a deux mois, d'un coup de soleil attrapé dans l'exercice de mes fonctions"—Mérimée was Inspector of Historical Monuments. In the latter years of his life the author of *Colomba* became more and more frank and confirmed in his Epicureanism. He devotes many of his last letters to the discussion of different qualities of wines. He preferred Château La Rose, and filled page after page with praises of his favourite *vin*.

THE many friends and admirers of M. Guizot will be grieved to hear of the death of the veteran historian's second daughter, M^{me}. Cornélis de Witt. She never came forward as an authoress; but some excellent translations of English tales, among others *Un Enfant sans Mère*, were attributed to her pen.

THE Imperial University Library of Strassburg has again been enriched by the presentation of a great part of the library of the late Consul-General von Schlözer, of Lübeck, by his children. It is especially rich in works on the history of Russia, the Baltic provinces, and Sweden, contains a selection of French literature, and includes also several works on the rights of nations.

MR. FORSYTH'S paper on the Rules of Evidence as applicable to the Credibility of History, which was read last Monday before the Victoria Institute, is a clear and able statement of the grounds on which intelligent persons come to read the first two volumes of Grote's *Greece* and the Canonical Gospels with equal conviction. The accomplished writer hardly recognises that the existence of historical traditions is a fact of which any adequate theory of evidence is bound to supply an explanation. In discussing the case of miraculous narratives he omits to observe that those who suppose themselves to be witnesses of such events are commonly too excited to be accurate, and in the interests of Protestantism he formulates the questionable principle, that strange events alleged to have occurred in the presence of many uncritical witnesses are more likely to be true than strange events alleged to have occurred in the presence of a few uncritical witnesses.

MR. GILDART JACKSON has a shrewd little paper in the *Contemporary* on the question, "Why am I a Christian?" where he observes: "Renan says somewhere that he does not doubt the possibility of the miraculous, but that he denies that the miraculous has ever been proved. Are we not a long way towards that proof when a liberal interpretation of the history containing miraculous facts is the only reasonable one?"

MR. JAMES SULLY, in the same journal, has a very clear and subtle paper on musical expression, in which he contends that purely instrumental music, in which alone the instinct for worthy and beautiful form has unfettered play, is fitter than the new opera of Wagner for the generalised expression of emotion, which is the highest function of musical art.

THE review of Victor Hugo's new novel by the editor in the *Fortnightly* is remarkable for the admission that Hugo's art is essentially melodramatic.

PROFESSOR COLVIN'S first paper on English Art under George III. contains little that will be new to readers of the *Portfolio*.

IN *Macmillan* Professor Williamson contributed some interesting supplements to Professor Hux-

ley's paper on Coal; the two most noticeable being that what Professor Huxley regarded as sporangia are really macrospores; and that what Professor Huxley regarded as carbonised spores is really disorganised mineral charcoal.

PROFESSOR SEDLEY TAYLOR, in his attack on endowed competitions at the Universities in the same magazine, commits himself to the curious proposition that it is a bad thing to put pressure on young men to acquire the habit of keeping large masses of heterogeneous knowledge present to their minds at once. The economic experiment in Ghent, described by J. G. Fitch, is a plan of Professor Laurent's under which the primary schoolmasters have persuaded some ten thousand children to save on an average twenty-eight shillings apiece.

THE *Cornhill* contains the first articulate account yet given of the relation between Johnson's personality and his writings. The author's theory is that the age favoured his expression of himself in conversation, whereas in writing his tendency to the grandiose was an anachronism.

There is also a clear and thoughtful paper *à propos* of Dr. Eitel's book on *Feng Shin*, which will shortly be reviewed in the *ACADEMY* by M. Feer.

There is also the commencement of a new story "A Rose in June," by a writer familiar to readers of the *Cornhill*, whose morality is too humane and rational to be binding.

THE subject for the Stassart prize this year, just awarded by the French Academy of the Moral and Political Sciences, was a study on Channing.

PROF. F. J. CHILD, of Harvard, writes:—

"I am in search of three missing MSS. of ballads. Two of them were lent to Sir Walter Scott by Alex. F. Tytler, but cannot be found now. Mr. Tytler knew nothing of them. They are not in the Museum, nor are they in the Advocates' Library at Edinburgh. The other is a MS. called 'Glute of Glenwdel,' lent by Mr. Jollie, a bookseller at Carlisle, to Scott a good many years ago."

Any information as to these MSS. should be sent to Mr. Furnivall, or to Messrs. Ellis and White, 29 New Bond Street, the agents of the Harvard Library.

MR. HALES'S paper before the New Shakspeare Society will probably be on *King Lear* as a type of the Kelt. Mrs. Hall, one of Mr. Halliwell's daughters, will probably contribute a paper on Shakspeare's word-quibbles, of which she has made a complete collection.

Two Shakspeare Reading Clubs have been formed at Bedford in connection with the New Shakspeare Society. They have been asked to unite as a branch of the New Society, and add to their reading and discussion of the plays of Shakspeare the discussion of the papers read before the New Shakspeare Society. Of the first Bedford Society Mr. C. E. Morris, M.A., the head master of the Bedfordshire County College, is president; Mr. Elger, a local astronomer and scientist, vice-president; and Mr. Rowland Hill, junior, of 14 Adelaide Square, honorary secretary.

FOR the search for Shakspeare's Inventory in the Probate Office we have already two volunteers—Mr. William Payne, of the Keep, Forest Hill, the treasurer of the New Shakspeare and Philological Societies; and Mr. George Fraser, of Middleton Road, N., though the latter can offer work for only two days.

CAPTAIN HARCOURT, of the Bengal Staff Corps, but who has been long employed in the Civil Service in the Punjab, has compiled a "Shakspeare Argosy," a long alphabetical list of subjects illustrated by choice quotations from Shakspeare. It will make a most handy book for writers who want to cite apt passages.

THE poet A. Barthet, who resided the last two years of his life in the lunatic asylum at Charenton, died last month at the age of 54. He wrote three pieces: *Le Moineau de Lesbie*, which was put on the stage of the Théâtre Français—Rachel

taking the principal rôle—in 1847; *Le Veau d'Or*, and *Le Chemin de Corinthe*, which were not played, the author refusing to make the required alterations. The deceased leaves behind also a collection of poems, called *La Fleur du Panier*. He was for some time secretary of the Théâtre Français. The remaining years of his life he passed in a state of melancholy, brought on by adversity.

A NEW edition, the sixteenth, of M. Emile de Bonnechese's *History of France* will appear in a few days. The author has abandoned his first intention of ending with the Revolution of 1848, and has brought his work down to the present day.

THE first part of the *Fac-similes of National Manuscripts of Ireland*, photo-zincographed by Major-General Sir Henry James, R.E., Director of the Ordnance Survey, is rapidly approaching completion, and will be shortly issued for sale. This work was undertaken, with the sanction of the Treasury, on the completion of the similar publications illustrating the national records of England and Scotland. The proposed scheme is to print three volumes, uniform with those of Scotland; the first to range from the pre-Anglo and Norman period of Irish history to the time of Richard de Clare's expedition to Ireland in 1170, the second from that date to the end of the reign of King Henry VII. in 1500, and the third from 1500 to the end of Queen Anne's reign in 1714. Among the manuscripts selected for this undertaking are several volumes, written both in Gaelic and Latin, of singular antiquity and historical value. The first of them, both in point of age and on account of the remarkable history attached to it, is the volume known as *Domhnach Airgid*, or "Silver Shrine." This is a copy of the Gospels—perhaps the oldest in the world—of the fifth century, and traditionally believed to have been the private book of devotion of St. Patrick himself, and to have been given by him to St. MacCarthainn when he placed him over the see of Clogher. It was once the property of the monastery of Clones; in recent times it was purchased for 300*l.* of a private gentleman by Lord Rossmore, who presented it to the Royal Irish Academy, where it remains at present.

Another manuscript to be represented by fac-similes in the forthcoming collection is the famous *Book of Kells*, a copy of the Gospels traditionally ascribed to St. Columba, and pronounced by the most competent judges to be undoubtedly of that age. This volume was stolen out of the church from which it takes its name early in the seventeenth century, and was discovered in the library of Archbishop Usher on the death of that prelate. Charles II. granted it to the University of Dublin, and it has been preserved in Trinity College ever since. The most remarkable features of the *Book of Kells* are its elaborate ornamentation and the quaintness of the grotesque subjects introduced into it. The gigantic initial letter, which is one of the portions selected for photographing, is filled in with an almost incredible interlacing of extravagances—serpentine figures with human heads; rats sitting on the backs of cats who are holding other rats by the tails; human figures with impossible combinations of their own and other creatures' limbs; strange shapes of birds and fishes; geometrical designs and intricate arabesque traceries, all woven together in the wildest dream-like way, and having an effect that charms the eye and fills the mind with amazement at the fancy that designed and the hand that executed them.

Another manuscript supposed to have been written by Saint Columba will also be represented in this series. This is the *Cathach*, or "Book of Battles," and is a copy of the Psalms. Why it is called the "Book of Battles" is told by O'Curry from the life of St. Columba by Magnus O'Donnahill, but the legend is too long for reproduction here. For 1,300 years the book has

been preserved as an heirloom by the O'Donnells, having been handed down by St. Columba himself, who belonged to that clan. The condition in which some portions of it remain is wonderful, and reflects great honour upon the family who have for so many ages and through so many national troubles and disturbances preserved the relic with such sacred care. It has been deposited for some years by its hereditary owner in the Royal Irish Academy.

Other volumes from which fac-similes have been taken are *The Book of Armagh*, upwards of a thousand years old, and held, as Professor Westwood relates, in such veneration that the family of MacMayre held lands from the see of Armagh by the tenure of its safe keeping; *The Gospels of Maelbride Mac Durnan*, Archbishop of Armagh from 885 to 927; the *Leabhar na h-Uidhré*, or "Book of the Dark Grey Cow," a copy made about the year 1100 of a more ancient manuscript of the same name written in St. Ciaran's time; and a copy of the Gospels known as the *Book of Moling* supposed to have been written about the year 690 by St. Moling, Bishop of Ferns; it was presented to Trinity College, Dublin, by a member of the family of Kavanagh, by whom it had been preserved for many generations in its metal covering.

The art of photo-zincography, we need scarcely remind our readers, was discovered by Sir Henry James in 1860; and in 1861 the value of the art for copying manuscripts was so fully recognised that the Government commissioned the discoverer to produce 500 fac-simile copies of *Domesday Book*. This task having been accomplished in 1864, Sir Henry James suggested that a series of national MSS. should be published in fac-simile, to illustrate the changes in our language and writing since the time of the Conquest. This was approved of, and the documents to be copied were selected by Sir Thomas Hardy, Deputy-Keeper of the Records; while to Mr. W. B. Sanders, an Assistant-Keeper of Records, was entrusted the work of arrangement, and the translations which accompany the fac-similes.

THE fourth and final volume of *Le Catholicisme et la France*, by the Comte Gazan de la Peyrière, has just appeared (Paris: Perisse). The two first volumes deal with the Primitive Church in France; the rest of the work describes the present position and influence of Catholicism. It is the production of a rather narrow and bigoted student, and contains some unseemly attacks upon MM. Littré, Taine, and Michelet. M. de la Peyrière dwells lengthily on the foreign mission work of the Catholic Church, and this is the most instructive portion of his work. The French missionaries in Cochin China and Japan appear to have almost monopolised the learning and disinterested devotion of the French clergy. Of course the author announces letters of congratulation from the Pope and the French bishops.

THE Argentine Republic have granted 2,000 dollars to Dr. Burmeister, to aid him in meeting the heavy outlay required for the printing and illustration of his colossal work on the Argentine States, which is to comprise twenty volumes.

SEVERAL historical items of importance reach us through the German papers. It is announced that the Cotta firm at Stuttgart will shortly bring out a work by Gregorovius, under the title of *The Story of Lucrezia Borgia*, which it is believed will throw a wholly new light on that tragic episode of Italian life. The work is to consist of two volumes, one of which will contain the text, and the other the materials upon which it is founded. An Italian translation of Gregorovius' *History of Rome in the Middle Ages* is being brought out at Venice for the Roman municipality.

A. DE REUMONT, author of the *History of the City of Rome*, is engaged on another page of Italian history. In a new work, entitled *Lorenzo de' Medici il Magnifico and his Times*, to be published

by Messrs. Duncker and Humblot, he undertakes to treat not simply of the political relations of the great prince to his times and contemporaries, but also of the state of art and of social life among the Florentine people at the zenith of the Renaissance movement, and the last phase of true national independence in Italy. This is a work for which the author's long and intimate acquaintance with the art, literature, and history of Italy specially qualifies him, and in his forthcoming book we may expect to meet with a clearer elucidation of the complicated conditions of that age than in any that has yet appeared.

NOTES OF TRAVEL.

THE *Débats* calls the attention of scholars and tourists to a *Mapa Mundi* which is painted on the cloister wall of the Camaldolese monastery of San Michel at Murano, and which might be profitably compared with our own Hereford Map. It dates from 1470, and is the work of the celebrated Frà Mauro. Its size, the beauty of the execution, the novelty of certain details, especially the interior of Africa, and the legends spread over its surface, combine to render it a very important monument of mediæval geography. The *Débats* suggests that Nicolas Conti, the rival of Marco Polo, who, at the time when this map was executed, had just returned to Venice after twenty-five years' travelling in Asia, may have suggested the idea to Frà Mauro. It is said that there is now a photograph of the map at Venice, and that a successful fac-simile had before been engraved by a Portuguese scholar.

A SHANGHAI paper mentions that in "the precincts of the Mixed Court are at present stowed, awaiting final disposition, a number of bags of 'lie tea' or Maloo mixture, which were confiscated by the Customs authorities. There being no counterpart of the institution known to the English Customs as the 'Queen's Tobacco-pipe,' the Mixed Court magistrate finds himself in some difficulty how best to get rid of the mixture so that it shall be beyond the ingenuity and the patience of the native *économes* of tea-rubbish again to utilise it. It would probably be difficult to burn it, unless in a strong furnace; and if some Court-runner were commissioned to have it made away with, the temptation would be great to turn a dishonest penny on the transaction by raising it again to the dignity of tea. The smart official would have a clear conscience regarding the matter so long as he kept the lieges of the Son of Heaven from being poisoned by the vile decoction, while as to the barbarian—he may say *ceaveat emptor*."

THE Italian naturalist and traveller, Odoardo Beccari, writes from the Aru group of islands (south of New Guinea), which he has made his head-quarters, that throughout the Indian Archipelago small-pox is raging, and that the disease is treated by the Dutch with quinine, and a cure effected. Taken in strong doses (60 to 100 grains English), quinine is said to diminish the malignity of the disease; suppuration is copious, and passes away easily and without inconvenience. In the Dutch hospital at Ambouina, since the use of quinine, only two patients died out of a number of 500. Beccari, who caught the disease himself, saved his life by this remedy, and soon got well. A correspondent of the *Cologne Gazette* says that this application of quinine is nothing new to German physicians. It is mentioned in the *Berliner Klinische Wochenschrift* (1872, No. 48) and other medical journals. Of course, quinine, to be effective, must not be given too late.

WE learn that the regulations of the Imperial Japanese Engineering College, printed in Japanese and English at Yeddo, have lately reached this country. The institution was established to train men for service in the Department of Public Works. A strong inducement is held out to painstaking and attentive students by the promise that "on passing a satisfactory examination they will receive the diploma of Master of Engineering, and will be appointed engineers in the Board of

Public Works." Admission will be obtained by competitive examination, and candidates must be between fifteen and eighteen years of age; the course of studies will extend over six years.

THE *Turkestan Gazette*, quoted by the *Débats*, announces that a caravan of forty camels, coming from Krasnovodsk with tea, sugar, wax-candles, wine, and various manufactured products, arrived at Khiva, November 26. The caravan crossed the Iomoude territories without incident. The passage from Krasnovodsk to Khiva took twenty-two days; the question of the practicability of caravan communication between the Caspian Sea and the mouths of the Amou-Daria may, therefore, be regarded as solved.

At a recent meeting of the Geographical Society of St. Petersburg, much interest was excited by the question of the establishment of a new route in Central Asia for trading purposes, which was to pass from the banks of the Yan-Usa-Tsian to Irtysch by way of Chama Khamil. The preliminary investigations have been entrusted to Messrs. Sosnowsky and Matusowsky, whose qualifications for the task are well known to the society, which has, moreover, submitted for the consideration and approval of General Kauffmann the plans of three geographical expeditions in Central Asia that are about to be organised. These projected expeditions are to embrace the eastern part of the Celestial Mountains to Urushtan, Turfan, and Kharashar; the southern ramifications of the Tian-Shan and the Tsun Lin; and the valleys of the Lower Oxus and the shores of Lake Aral and the Caspian Sea. While the members of the society await the decision of General Kauffmann with regard to which of these three routes would appear to promise the richest harvest of scientific results, they are busily engaged under the zealous direction of their president, the Grand Duke Constantine Nikolaevitch, in preparing for the immediate prosecution of one of these important expeditions.

HERE are two items of news from Japan. The Temple of Shiba was destroyed by fire on New Year's Day. It was one of the principal attractions of Yeddo, and was two hundred and seventy years old. The Empress has presented copies of an illustrated Japanese-English Dictionary, and of Smiles' *Self Help*, in Japanese, to the most successful scholars at the native girls' school.

FROM a Russian account of the Khanate of Kokan, written by a member of the recent embassy thither, we learn that the chief products of that state are cotton and tobacco, and that the former when made up is much sought after by the Russians in exchange for iron, vitriol, sandal wood, furs, steel, and cloth. Silkworms are very generally reared, but the silk manufactured is inferior to that of Bokhara. The laws against dishonest trading are worthy of note. Any merchant convicted of wilful deception in business is first lashed, and then led round the city and compelled to proclaim aloud the circumstances of his fault and punishment. Such a method of dealing with our refractory grocers and milkmen in this country would no doubt prove directly efficacious, besides suggesting a practical means of dispensing with the necessity for that ancient functionary, the town crier.

Aperçu de la Situation en Chine, 1861-1873. Par Thomas Fergusson, de Chefoo. (Trübner.)—If we mistake not, Mr. Fergusson was one of the first British merchants who settled at Chefoo after it was opened to foreign trade, and, when first placed in charge of French interests there, was somewhat unfortunate in his relations with H.B.M.'s Consul. It is almost a pity that he yielded to the solicitations of his friends in publishing this pamphlet. It is the old story of complaints against the Chinese Government and the foreign envoys, &c., &c. He thinks that, in reviewing the diplomatic transactions of the last ten years, Chinese statesmen may congratulate themselves on having

yielded no point of importance to the representations of foreign diplomatists. Nothing will satisfy Mr. Fergusson short of the "opening up" (how tired we are of that phrase!) of the entire country to what he calls "entreprises modernes," by which he evidently understands the construction of railways and telegraphs, and the opening of coal and other mines (chiefly for the benefit of foreign traders, we imagine); according to him, too, foreigners ought to be allowed to buy land and houses and settle in any part of the Empire that they choose to fix upon, and, in point of fact, be placed in the same position in China as they occupy in the more highly civilised countries of the West. We should have thought that a residence of thirteen years even at the small port of Chefoo would have taught the writer that China is not yet ready for such radical changes. We must be content to wait and bide our time. We are glad that Mr. Fergusson has nothing much to say against the administration by Europeans of the Imperial maritime customs, and it is pleasing to hear that the Chinese appreciate the benefits derived from this so much, that there is already some talk of adopting similar arrangements for the collection of the internal revenues of the Empire. When that day really does arrive, we shall probably see some startling changes in the Middle Kingdom, and perhaps even Mr. Fergusson's hopes may then have some chance of fulfilment. At present, however, it is to be feared that the party of progress is not strong enough to venture upon so bold a step as this; and if they were to take any such step rashly, the probability is, that they would plunge the Empire into a disastrous civil war.

THE MARTIN GUERRE CASE.

BEFORE we finally dismiss from our minds all thought of the Tichborne case, which came to an end on the last day of last week, we may perhaps be allowed to take a parting glance at its only pendant—the Martin Guerre and Arnold Tilh case.

This story has of late years been more than once rehabilitated and clothed in a readable form, after having lain for ages buried in legal dust and oblivion, and its general character and resemblance to the Tichborne-Orton case have become tolerably well known. It must not be forgotten, however, that below the ordinary features which the two cases have in common, there are other and special characteristics, which raise the old so far above the new trial, that its claim to be considered the most remarkable on record is still pre-eminent and secure. In proof of this pre-eminence, we need only give the main outline of the story of Arnold Tilh's successful impersonation of his friend and brother in arms, Martin Guerre. Those who would fill in the minute and crowded details of the picture must seek them in the tragical and fascinating records of human crime and weakness to be found in the Pitaval and other collections of *Causes Célèbres*. Here we have only space for the deeper lines and the more salient points, which we now proceed to give.

The scene of the Martin Guerre drama was laid in the south of France, where, at Artigues, near Rieux, the Guerre family had for many generations tilled their own small portion of land, subdividing it, after the fashion of their class, into allotments, which were held by the several members of the household. In accordance with this practice, Martin Guerre—who was born in 1539, and was the only son of the representative of the family at the period when their history began to gather round it the colouring that was destined to give it notoriety—was brought up to share with his father in the labours and management of the farm. For a time parent and son lived at peace and worked in amity together, but when Martin was about twenty-one, he was accused, if not convicted, by his father of having appropriated to his own use corn that ought to have been shared between the two. A quarrel was the result, and the young man, stung by remorse, or maddened by an unmerited accusation, hastily left his father's presence,

and without exchanging a word with anyone fled from the village. Time passed, months and years went by, and no tidings came from or of the fugitive, whose name, however, remained a byword and reproach to his townsmen. They might have looked more leniently upon his flight if he had had no one to leave but the parent who had roused his anger; for those were lawless times, when a very slight provocation was deemed a valid reason for driving young men from the discipline of home-authority to the licence of camp-life. But Martin was a husband and a father; and he had in bygone days made his domestic affairs such general subjects of interest and discussion, that his friends felt especially aggrieved that, after they had given their sympathy and counsel under the interesting conditions confided to them, he should have preserved such reprehensible mystery in regard to the reasons for his going and staying away.

The fact was that Martin Guerre, in accordance with a not unusual custom of the times and place, had been married at the age of ten to a little *compatriote*, called Bertrande Rols, who numbered nearly as many months as himself. After a time the youthful couple became the objects of special interest to the entire district on account of the evil spell which, according to Martin's conviction, had been exercised to prevent him from feeling a suitable degree of love for his wife. Friends and neighbours were consulted, numerous ceremonials were gone through, but for a time the spell, in which every one implicitly believed, continued potent, and Bertrande's relatives became at length so indignant at the notoriety which was attaching itself to her domestic life, that they prepared to have the marriage set aside, on the ground that powers of sorcery had been used to thwart her happiness. But here, with a spirit that surprised those who regarded her as a girl of no will, she herself interposed, and declared that, in spite of evil spells, she would stay by her husband. Then the matter dropped, outsiders grew tired of the subject, Martin said no more about the power of sorcery; and when the young man left his home, Bertrande and he were regarded as one of the happiest couples in the community. Her conduct after Martin's cruel desertion was exemplary, and even the most malignant of gossips could say nothing against the conduct of the young mother, who went quietly through her household duties, absorbed as it appeared in her child and her home.

In the summer of 1557 a rumour spread like wildfire through the streets of Artigues that Martin Guerre had returned, and was safe and happy with his wife and son. The towns people, eager with wonder and curiosity, hastened to the house, where, with the sturdy boy on his knees and Bertrande close beside him, sat a bearded man, who welcomed them as they came in, joked with one, and reminded another of a half-forgotten piece of boyish fun or some hairbreadth escape that had long since passed out of their memory. One and all went away rejoiced to have seen the Martin Guerre of olden times grown so manly, frank and talkative; no one expressed a doubt as to his identity, and it seemed an accepted fact that the pleasure of his return was to condone all past offences. Martin's four sisters had been the first to welcome him, and as one by one they had fallen sobbing on his neck, he had called up the memories of their childish days by some nickname or endearing term; and radiant with joy the women had led him to their uncle, Pierre Guerre, who, since the death of their father, had held in trust the family land for Martin and his little son, Sami. He too had recognised him, and spontaneously arranged to surrender to him his trust. Bertrande, without the slightest apparent doubt, had received him as her husband and the master of her house.

For a time all was serenely bright. Three years passed away. Bertrande had given birth to two children, and seemed happy and at peace in her

home, and the people of Artigues, accustomed to the sight of the revived Martin Guerre, had ceased to regard him with any special interest, when it was whispered that a soldier in passing through the town had stopped to ask if the Guerre family belonged to the place, and when told that Martin Guerre was living close by, had laughed, and said no one need think he could be so easily imposed upon, for the true Martin Guerre was at that moment in Flanders, where they had fought side by side for many a long day. And if the Martin Guerre of Artigues had two legs they might rest assured "that the man was an impostor, for he had seen a cannon ball carry off the leg of the true Martin, who since then had had to go about with a wooden leg." This startling tale gained force by the discovery that Bertrande had appeared with the soldier before a notary and caused a written statement to be made of his words.

The next scene in the drama was the arrest of Martin, at the instigation of old Pierre, on a charge of being an impostor; and what made this transaction the more remarkable was, that the charge had been signed by Bertrande, who shortly before, when asked by the uncle if she had any doubt as to his identity, had indignantly protested that he was the husband of her youth, adding, however, "if he were not Martin Guerre, it must be the devil in his skin."

The trial began, and 150 witnesses were called before the Court at Rieux to declare on oath whether the accused was Martin Guerre, or Arnold Tilh, as the old Pierre Guerre had insisted. Sixty of those called were unable to give a decided opinion, owing, as they asserted, to the great likeness between the two men. Thirty persons swore without hesitation that the accused was Martin Guerre, and fifty with equal confidence pronounced him to be Arnold Tilh. When the Guerre family were brought into court, Martin's four sisters were observed to be as like the accused "as one egg to another;" although Martin's son showed no resemblance to him. The man's own account of himself bore the impress of truth, his defence was simple and natural, he was calm and moderate, yet eloquent, while his accuser Pierre was hurried, bitter and incoherent. Nevertheless the Court gave their judgment against him, and condemned him to lose his life by the sword, and have his body quartered after death. Against this sentence the accused made an appeal to the Parliament of Toulouse, and a new trial began. The first step taken was to collect evidence in regard to the character and conduct of Bertrande, the result of which was to show that she had led a spotless life; but when she was brought into Court she evinced strong marks of confusion and trepidation, and to his impassioned appeal that she would declare him to be her husband, since if she turned against him life would have no further charms for him, she made the ambiguous reply, that she "could neither assert or gainsay it." The judges received this answer as evidence in favour of the accused, whose case seemed strengthened by the fact that the true Arnold Tilh had been a gambler, swearer, thief and scoundrel, while this man had for three years led a quiet domestic life. The trial proceeded, an enormous amount of evidence was brought forward by the witnesses as to personal marks of identity; the advocates nearly came to blows; and every authority, classical and historical, that could be brought to bear on the case, was advanced on either side. It was sworn by those most competent to give an opinion that Martin was taller, slighter and fairer than Arnold, that his foot was three sizes larger, his eyes a different colour; that he had spoken the Basque language and could fence well, neither of which the accused could do, and that he had always been noticed for his taciturnity, and accounted a truthful, peaceful, moral character, while Arnold, who belonged to a neighbouring village, had been known, far and near, as a chatterbox, liar and brawler, and been generally regarded as a worth-

less scoundrel. Yet in spite of all, no decision could be arrived at; and the judges, in despair at the mass of conflicting evidence before them, were about to send the accused back to prison, to be kept chained and manacled, in accordance with the practice of the time, till new light could be obtained to guide them to a right judgment, when the Court was startled by the sudden appearance before them of a one-legged man, holding a petition in his hand for restitution of his civic and conjugal rights as Martin Guerre. The perplexity of judges and advocates became overwhelming. To decide upon the identity of one Martin Guerre had baffled all their efforts, and to have two in the field against them seemed more than the strongest of judicial forces could resist, and there was an evident leaning on the part of the Court generally to regard the man's appearance as an illusion of Satan, or the work of witchcraft.

The confused manner in which the stranger answered the inquisitorial examination to which he was subjected when the Court had recovered from its first perturbation, confirmed the evil opinions inspired by his appearance. When confronted with the accused he lost all presence of mind, while his opponent never betrayed the slightest agitation, hesitation, or uncertainty. The effect of this verbal duel for life and name was to bring judges and advocates to the side of the man who stood before them confronting the stranger with the frank firm bearing of innocence, while his one-legged rival, pale, panting, and abject, covered by his side. As a final act of impartial justice it was resolved to bring the Guerre family once more into court. The four sisters of Martin came first, one by one. As the eldest caught sight of the pale and haggard stranger, a look of terror came over her face, and after looking at him intently for a moment, she rushed forward, and with sobs and tears begged his forgiveness: "she was not alone to blame," she pleaded, "for had not all Artigues shared her delusion?" A similar scene recurred as each of the other sisters was confronted with him. Then Bertrande was called, and now truly the beginning of the end had come. As she crossed the threshold, her eyes met the stern glance of the man, and stopping short, she stood transfixed with terror and emotion, then bursting into tears and stretching her hands helplessly out before her, she dragged herself on her knees beside him, and with bowed face and broken voice sobbed forth a piteous prayer for forgiveness.

All was over, the play was played out. The sight of the prostrate woman pleading for mercy at the hands of the stern man, who gave no sign of pity, rent asunder the last link in the chain of deception which Arnold Tilh had up to that moment so firmly kept in hand. He told the judges he would confess all; and with not a moment's delay began his tale. The narrative was simple enough. His imposture had begun in sport, and been carried on in earnest when he found how readily the credulity of others enabled him to forge weapons for their own self-deception. Having shared the same tent with Martin Guerre in Flanders, he had learnt from him all the incidents of his life, including even his assumed subjection to sorcery. On coming into the neighbourhood of Artigues, passers-by had addressed him as Martin, and thinking their mistake might prove diverting, he had lent himself to the deceit with a success that became more and more easy as he gathered up more and more information. Poor Bertrande had herself proved his most valuable accomplice, although at first probably an innocent one, and soon the part he played had become natural and easy to him.

Such was the simple explanation of the success of the most astounding case of imposture on record. His own unscrupulous and ready wits, coupled with the unfathomable and inexhaustible depths of human credulity, were his only weapons. Arnold Tilh expiated his crimes against society and the Church by death on the gallows, on September 16, 1560; and to make the sentence

more impressive, his execution was ordered to take place in front of Martin Guerre's house-door.

The judicial records of the Parliament of Toulouse, in which are preserved the details of the observations made on the conduct and assumed motives of all concerned, during the prosecution of the trial, are silent as to the relations of Martin and Bertrande after its close; and it is therefore left to the imagination to decide how far the injured husband relented towards his unhappy and offending wife.

CORRESPONDENCE.

DR. BEKE'S SINAI.

Cambridge: March 4, 1874.

Dr. Beke's sensational announcement by telegraph of the "discovery of the true Mount Sinai" may have startled some people into acquiescence in his theory, but I can scarcely believe that any one who has really considered the question can have regarded the "discovery" *au sérieux*. Still, an assertion so positively and unequivocally made seemed to imply some cogent and decisive arguments in the background; and I must confess that I looked forward with some interest to the further detailed explanations promised by the learned traveller. These have at length appeared in his letter in the *Times* of February 27, but, strange to say, we, the advocates of Jebel Mûsa, the old orthodox Sinai, do not feel ourselves so utterly annihilated as we perhaps ought to do. It would be unjust to attack Dr. Beke's theories before he is himself upon the spot to state his case and answer our arguments; but while I am, like my fellow-travellers, willing to wait until that time, I cannot let such an assertion pass entirely unchallenged. Dr. Beke starts with the assumption that Mount Sinai is a volcano, and is situated to the east of the Shor, instead of to the west of the Gulf of 'Akabah. Arrived at 'Akabah he selects the first prominent mountain to which some traditional sanctity appears to attach, and at once adopts it as his Sinai, with the statement that "its identification with the mountain on which the law was delivered, is scarcely open to a doubt." It is not a volcano, it is true, but on that point the Doctor naively owns that he was "egregiously mistaken." The reasons which carried this conviction to his mind are strangely inadequate. They are: 1. That he had heard the mountain in question "vaguely spoken of in Egypt, as being that whereon the Almighty spake with Moses;" 2. That there are traces of sacrificial remains on the summit; 3. That "Sinaitic inscriptions" are found there. He appears also to attach considerable importance to the alternative name of the mountain, Jebel-en-Nûr.

Now, as Major Wilson has pointed out in his letter to the *Times* of the 3rd instant, the country on either side of the Gulf of 'Akabah absolutely teems with traditions of Moses, the name of the lawgiver being associated with nearly every striking natural phenomenon which occurs. With regard to the sacrificial remains, there is scarcely a "high place" in the desert where the Bedawîn do not offer up sacrifices. As for the "Sinaitic inscriptions," those which have hitherto reached the hands of European scholars are either in Nabathean or Greek, and in no case of an earlier date than the first few centuries of the Christian era. These again are scattered throughout the length and breadth of the desert. However, until Mr. Milne's copies are brought home, it would be premature to pronounce upon them. The name "the mountain of light" surely points rather to Sabaeism than Mosaism, and would in that case satisfactorily account for the sacrifices. So much, then, for the importance of these alleged proofs of identification; but Dr. Beke says that "from its position and other circumstances the mountain is undoubtedly the Sinai of Scripture." It is here that the crucial test of the soundness of the theory may be applied, for one of two things must be assumed, either that the sacred penman gave an incomplete account of the itinerary of the Israelites, for some half dozen or more stations must be added to the lists in Exodus and Numbers, to take them to a Sinai situated within a day's journey of 'Akabah; or else the hitherto unquestioned identification of the Egypt of the Pharaohs with the Mizraim of the Bible must be abandoned. This latter view has been more than once advocated in the face of the testimony of history and of hieroglyphic monuments, and of the entire absence of any trace of such a civilisation as that mentioned in

the Bible narrative of the Exodus, east of the Nile valley.

Here, then, is the initial difficulty. If we can believe the inspired writer ignorant of the number of stations between Egypt and Sinai; or if we can believe in a second Egypt east of the Isthmus of Suez which has passed away without leaving a trace of its existence behind, then we may reject the traditions of ages, local and historical, the evidence of physical facts as reported by the Ordnance Survey, and a long series of travellers, in favour of the mere hypothesis of a gentleman who acknowledges himself to be "egregiously mistaken" upon the main point which he undertook his journey to prove.

In the meantime I feel sure that the public will at least suspend its judgment, until Dr. Beke's return has given the supporters of the traditional Sinai an opportunity of hearing and discussing his arguments *in extenso*. E. H. PALMER.

DR. SCHLIEMANN'S DISCOVERIES.

Queen's College, Oxford: March 2, 1874.

Dr. Schliemann will have to be added to the list of fortunate explorers who have succeeded in finding exactly what they wanted. He was determined to discover Priam's Palace at Hissarlik, and he has done so. He looked for traces of γλαυκῶπις Ἀθήνη, and met with them, just as he will meet with images of βουῶπις Ἥρα at Mykenae whenever the Greek Government allows him to dig there. It is a curious instance of the power of a prepossession, since "the owl-headed deity" which Dr. Schliemann has found in gold and clay, in ivory and slate, is nothing more than the rude attempt of early art to delineate the human face. It requires a strong pair of spectacles to see an owl's beak on the beautiful vase with which Dr. Schliemann has appropriately adorned the cover of his book. Early human figures from the Greek islands, which are now in the British Museum, have heads even more owl-like than those from the Troad. A Trojan hone (No. 3474) which bears one of the few inscriptions discovered, has a similarly rude human face below the legend, which probably gives the name of the owner. But the inscriptions found by Dr. Schliemann are, unfortunately, exceedingly scanty. As Professor Max Müller has pointed out, most of the marks on the terra-cotta disks, which might be taken for letters, are really intended for ornamentation. The four-legged animals are very numerous, some of them having spears or arrows stuck in their necks, and passing, as the Oxford Professor remarks, into a character which bears a strong resemblance to the Cypriote character *ki*. The serpent, the sun (No. 5338), the tree (3325), and the disk (3307), are also frequent, and the representation of the sun confirms Professor Max Müller's ingenious suggestion that some of the constellations are depicted. I can hardly agree, however, with his explanation of the cross, which is by far the most common ornament made use of. Such forms of it as are delineated in Nos. 2976, 2984, 2982, 2530, and 548, seem to me to exclude the idea of its having been originally intended for a man; indeed, the human figure has five divergent lines in 298, just as in the images from the Greek islands referred to above. In No. 2984 the cross has a circle drawn within it, like the cross on the breast of the Assyrian king, Assur-natsir-pal, the two symbols probably denoting the four quarters of the earth with the circle of the sun. The Assyrian influence which shows itself so plainly in the art of prehistoric Greece and Asia Minor might be expected to appear in the ancient civilisation of Mysia. The Trojan cross could easily be a trade mark.

I have already alluded to the Cypriote syllabary, and it seems to me that Dr. Haug's comparison of the characters in the Trojan inscriptions with those of the Cypriote legends, has more probability than Professor Max Müller's view that they are to be explained by the Semitic alphabet. If this is the case, indeed, they would show such far-gone degradation by the side of the Kadmeian alphabet

as we have it on the Moabite Stone, that the inscriptions and all the rest of "Priam's Treasure" would have to be referred to a considerably later period than the foundation of Ilium Recens. But the two identical inscriptions 208 and 432, together with Nos. 3278 and 3474, and perhaps 3415 (if this is really an inscription), bear too great a likeness to the epigraphs from Cyprus not to suggest the common origin of the characters of which they are composed. Dr. Haug's attempt to read them has been unfortunate, but this is not to be wondered at. Mr. Smith has found Cypriote inscriptions in the Palace of Assur-bani-pal, so that they mount back to a respectable antiquity, and the characters in them have so far lost all resemblance to their primitive hieroglyphic forms as to push back the date of the syllabary to an early period. Now, of the two identical Trojan inscriptions 208 and 432, the first shows us what is apparently the outline of a man, where the second has a letter not unlike the Cypriote *pe*. This would imply that the Trojan legends are of an earlier date than those from Cyprus. But a closer inspection of both the Trojan and Cypriote inscriptions seems to imply a connexion between them and the mysterious hieroglyphs of Hamath, which have also been found on seals discovered by Mr. Layard in the Palace of Sennacherib at Kouyundjik. Can it be that the Phoenician alphabet was preceded in Cyprus, in Asia Minor, and elsewhere by a syllabary derived from the Hamathite hieroglyphs? The supplementary characters in the Karian and Lykian alphabets, which do not seem to belong to the Phoenician, but find their analogues in the Cypriote, would be relics of the ancient syllabary which was exchanged for the more commodious Phoenician alphabet.

If the suggestions I have thrown out have any foundation, the following conclusions might be drawn from them. (1) "Priam's Treasure" would be pre-Hellenic and pre-Phoenician. (2) The largely modified form of the characters in the Trojan inscriptions and their remoteness from their hieroglyphic origin prevent us from assigning them to any great antiquity. (3) Northern Syria would have preceded Phoenicia as a civilising power. And (4) continental Greece would have had no share in the early culture of Asia Minor, since its first knowledge of writing came from Phoenicia, and its first art, as exemplified in the lions of Mykenae and the Phoenician pottery found in the same place, from Assyria and Sidon or Tyre.

Hissarlik must have been a hill fortress, like Mykenae or Tiryns, to which the natives retired as a last refuge before the attacks of the Greek colonists, and where they buried all the treasure they had been able to carry with them. To seek for the Ilium of the Homeric poems either at Hissarlik or Bunarbashi, is like basing an atlas on the *Odyssey* or the *Nibelungen Lied*. It is true that the poets who sang the lays out of which the *Iliad* has grown were for the most part natives of Asia Minor, and Smyrna was their oldest gathering-place; but although the ancient Aryan myths were localised in a country well known to the bards, the actual geography must have been so far modified by the conventional requirements of a mythical one, as to make the identification of the true Ilium a matter wholly impossible. A. H. SATCE.

THE ASCENT OF FLUID.

Royal College of Science for Ireland, Stephen's Green, Dublin: March 2, 1874.

I observe in the *ACADEMY* of Saturday that Dr. Pfitzer has obtained results higher than those recorded by me in the *Transactions of the Edinburgh Botanical Society*, in my paper on the ascent of fluid as determined by lithium citrate and the spectroscope. It may, perhaps, not be uninteresting to mention that on February 9 I communicated a paper to the Royal Irish Academy in which I gave the results of numerous recent experiments. In that paper, which will be published shortly, I recorded the highest results I

have yet obtained with lithium citrate and the spectroscope, namely, 40 inches per hour in the sunshine.
W. N. McNAB.

A REVOLUTION IN PSYCHOLOGY.

45 Conduit Street : March 2.

Am I trespassing too much on your space in asking permission to say a few words upon Professor Clifford's reply (ACADEMY, Feb. 28)?

If by the "science of psychical phenomena" Mr. Lewes meant, as Professor Clifford means, psychology proper, I am not concerned to deny that Mr. Lewes may have effected a revolution in it. It was on the supposition that Mr. Lewes meant general psychology that I ventured to doubt the revolutionary character of his views. The question is not what Professor Clifford, but what Mr. Lewes, meant by the phrase.

But it is possible that Mr. Lewes had in view a science which coincides neither with my general psychology nor with my psychology proper; he may have meant, what I think is most usually meant by the term psychology, a science which covers the same ground as they together cover. Such a psychology is not a little unwieldy, and it is to render it more manageable that I propose to distinguish it into two. That this would be desirable if attainable is implicitly at least admitted by Professor Clifford where he says: "But the social medium must act upon the organism, and so these conditions [of thought] are really reduced to the previous ones? Theoretically, yes; practically, no."

Assuming, then, that it is desirable that our practice should correspond to our theory, I propose for that end my distinction between general psychology and psychology proper, and advocate the subjective treatment of sociology as a part of general psychology.

That is to say, by adopting in thought the position of an individual surrounded by others in society, and by asking what they and his relations to them are *to him*, or in terms of his feelings and thoughts, we reduce to a common denomination both their physical and their moral reactions upon him. They are to him reagents not only on his senses, but also on his imagination, conscience, and reason. The detail of the physiological processes, which are the condition of these reactions, belongs to psychology proper; the detail of the reactions themselves, as they appear to him, belongs to general and subjective psychology. The method thus enables us to separate the physiological from the mental or subjective reactions of the social medium. All the physiological reactions are put together in one group, and all the mental reactions in another.

It is in fact this very distinction of mine which permits us to neglect (provisionally) the physiological "conditions of intellect and conscience;" and it is the study of the mental or subjective reactions, sociology subjectively treated, which "enables us to cut the knot that is left to posterity to untie." Sociology, simply, is a part of history, or of the science of history; but apply my distinction, treat its phenomena subjectively, study the mental or subjective reactions between individuals and the groups to which they belong, and then these phenomena become a part of psychology, and throw back light upon the inner mechanism of history. Otherwise they are not psychological phenomena at all, but historical; and we remain students not of psychology, but of simple history and sociology. To say that sociology is a basis of psychology is to say that the objective study of social phenomena is a basis of their subjective study.

SHADWORTH H. HODGSON.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Mar. 7, 3 p.m. Beethoven's *Egmont* at Crystal Palace.
Saturday Popular Concerts.
8 p.m. M. Gounod's Choir.
MONDAY, Mar. 9, 1 p.m. Sale of Mr. C. B. Taylor's Collection of old Venetian glass, &c., at Sotheby's.

8 p.m. First night of Mr. Tom Taylor's *Lady Clancarty* at the Olympic.
Monday Popular Concerts (Joachim). Medical (anniversary).
8.30 p.m. Geographical.
TUESDAY, Mar. 10, 1 p.m. Sale of Engravings, Water-colours, &c., at Puttick & Simpson's.
8 p.m. Institute of Civil Engineers. Anthropological Institute. Civil Engineers. Photographic.
8.30 p.m. Medical and Chirurgical.
WEDNESDAY, Mar. 11, 1 p.m. Sale of works of Carpeaux at Christie's.
2 p.m. Sale of Sculpture, Bronzes, &c., at Christie's.
3 p.m. Royal Literary Fund (anniversary).
4.15 p.m. Royal Society of Literature.
8 p.m. London Ballad Concert. Society of Arts: Mr. Holm on "The Manufacture of Cocoa." Geological. Graphic.
THURSDAY, Mar. 12, 1 p.m. Sale of Lord Powerscourt's Land-seer engravings at Christie's.
3 p.m. Royal Institution. Prof. Williamson, of Owens' College, on "Ferns and Mosses."
6 p.m. Royal Society Club.
8 p.m. British Orchestral Society's Concert. Mathematical.
8.30 p.m. Antiquaries. Royal.
FRIDAY, March 13, 1 p.m. Sale of Lord Dunmore's porcelain at Christie's.
3 p.m. Royal United Service Institution: Gen. J. L. Vaughan, "The Retreat of the Ten Thousand, a Military Study for all time."
7 p.m. Literary and Artistic.
8 p.m. Astronomical. Quekett Club. Society of Arts: Dr. Leitner.
8.30 p.m. Wagner Society's Concert. Clinical.
9 p.m. Royal Institution: Dr. Wright on "Chemical Changes accompanying the Smelting of Iron in Blast Furnaces."

SCIENCE.

Foods. By Edward Smith, M.D., LL.B., F.R.S., &c., &c. (H. S. King & Co.)

THIS book is one of the "International Series" of manuals, and one which will certainly not be the least popular, nor, we venture to think, the least useful. After a short introduction on "The Nature and Qualities of, and the Necessity for, Foods," the book is divided into three parts, which treat respectively of "Solid," "Liquid," and "Gaseous" Foods—another way of putting the old division of food and drink, with the addition of a new section on "Atmospheric Air" and "Ventilation." Now, when we find in the introduction that a food is defined as "a substance which when introduced into the body supplies material which renews some structure or maintains some vital process," we see why oxygen is looked upon as a food. But oxygen gas is not a food in the sense that the others are; it is taken into the body by a special apparatus, and performs a special function—that of breaking up some of the substances it meets with in the blood (both foods and waste materials), combining with the simpler substances so produced, and continuing this process until still simpler substances are formed, which are then separated from the body by special excretory organs; during this process heat is given out, and thus the animal heat is maintained. If oxygen is to be regarded as a food we must regard it as a fuel, and we see neither scientific nor practical advantage resulting in either case; in fact, we believe that the result of classing it side by side with foods and drinks will be to confuse the minds of a great number of people as to its real function in the blood. If we lived in an atmosphere of hydrogen or of carburetted hydrogen, we should no doubt use oxygen gas for lighting and heating purposes, and we should call it com-

bustible and look on it as fuel; but we do not live in such an atmosphere, and so are not accustomed to speak of oxygen in this way, and there is no reason whatever why we should.

In his admirable course of lectures on Therapeutics at the Paris School of Medicine, Professor G. Sée used, in distinguishing between food and medicine, to say, "Nous avons besoin de deux sortes d'aliments; il faut d'abord des aliments pour fournir la chaleur en brûlant, et ensuite des aliments pour réparer la machine qui s'use;" but what Sée meant by burning was breaking up and forming combinations with oxygen, and this way of looking at the matter has many merits.

Part III. would therefore, we think, have been better omitted, especially as on the first page of it we are told that

"there is an analogy between air and water as to their relative composition, for both may be produced from the combination of only two gases, and yet such products are not found in nature,"

an extraordinary statement, which is only partly corrected by one on the next page to the effect that oxygen and nitrogen

"are not combined as oxygen and hydrogen combine to form water, but are simply mixed together."

Ozone is also referred to, and it is assumed that

"if the commonly accepted views be correct, that substance has greater food properties than oxygen itself."

Some doubt is thrown on this assumption farther on; and indeed we know, from recently published experiments, that ozone is as irrespirable as carbonic acid, as might have been expected from the density of the gas. There is no evidence whatever that it acts as a food in any way; though it is useful in purifying the air by oxidising organic matters, which it does very rapidly, as no sign of it is found in foul air. Part of the oxygen given out by plants is in this condition, as shown by Dr. Danbeny, and thus we see that plants not only maintain the proper standard of oxygen in the air, but help to destroy impurities in it.

The rest of the book, consisting of the parts on Foods and Drinks properly so called, is very interesting and instructive, for few men have so fully and carefully studied the action of foods as Dr. Edward Smith, and the number of experiments which he has made is quite astonishing.

In Part I. the "Solid Foods" are described under the heads of Animal and Vegetable Foods, each of which is further subdivided into nitrogenous and non-nitrogenous; while "condiments" are thrown in between the two subdivisions of vegetable foods, and in the table of contents have got mixed up with one of them. It seems a pity that common salt should merely be classed as a condiment, while the absolute necessity for it as a food is insisted on.

There are a few pages on the "cooking of flesh," which many housekeepers would do well to lay to heart; they would there learn why "you cannot have good broth and good meat from the same piece of flesh;" they would learn the principles on

which to act so as to utilise the greatest amount of the nutriment of the meat without violating the main condition of successful cooking—that of making “the whole mass of meat soft and tender.”

“A slow fire, or water at a temperature of 160°, will suffice to expand the fibres and in some degree to rupture them, whilst it separates these and other structures and renders the whole mass more fitted for mastication and digestion. To keep meat in boiling water, or to expose the joint to continued heat before the fire, is to make it hard and to extract a greater proportion of the juices.”

Were these simple matters attended to a little more, we should see much less of that hard, unmasticable, overdone meat, or of that tough, ropy *bouilli*, which are not so very much more nutritious than cocoa-nut matting.

Dr. Smith then gives an account of the various processes for preserving meat, and some sections on the properties of the flesh of various animals; on preparations of meats, on eggs, cheese, butter, &c. Here we encounter the disadvantage of having cheese and butter, as solid foods, separated from and considered before milk, from which they are derived; however, such disadvantages as this are probably incident to any form of classification.

Liebig's extract of meat Dr. Smith, as is well known, regards as “a meat-flavourer,” and only indirectly as a nutriment; “it should be classed with such nervous stimulants as tea and coffee, which supply little or no nourishment, yet modify assimilation and nutrition.”

The nutritive properties of gelatine are insisted on, and experiments are adduced to support “the experience of all people that jelly is a valuable food.” It is certainly true that the “elaborate series of experiments which were made in France,” and which seemed to show the contrary to be the case, were not conclusive; and more recent experiments, made also in France, seem to indicate that gelatine may supply the place of some of the “circulating albumen,” though it is perhaps incapable of taking the place of “tissue albumen,” or even of forming gelatinous tissues. However this may be, it seems certain that the condemnation of gelatine as a food was hardly warranted.

Under vegetable foods we notice that Dr. Smith gives great praise to wheat as “a far more agreeable food than maize and a more nutritious food than rice;” and he even goes so far as to consider

“that the health and mental and bodily vigour of the inhabitants of temperate climates are more attributable to this food than to any other single cause.”

He also points out the fallacy of supposing that brown bread is more nutritious than white;—

“That it (the bran) can add directly to nutrition is impossible; and whilst it may be very useful to those who are well fed and need a laxative, it may be worse than useless to the ill-fed, who need nourishment.”

Under “Liquid Foods” we have first water, which is very fully considered, the methods of analysis now in use being described in long quotations, no doubt with the view of treating the subject as completely as possi-

ble. Although these descriptions will be little understood by the general reader, and are already in the possession of chemists, still it is desirable that the knowledge that such accurate methods of determining the qualities of samples of water are in our possession should be disseminated.

For the examination of milk the lactometer gets, we think, too much credit; for it is at best a treacherous guide, and ought not to be relied upon: it will deceive both with very rich milk, containing an unusually high percentage of cream, and with milk which has been, as the Americans say, “skillfully sophisticated.” Preserved milk is considered by the author to be occasionally useful and convenient, but the practice of giving it to children instead of new milk is justly condemned, and Dr. Daly's experience on the subject quoted from the *Lancet*.

Not the least interesting part of the book is the very complete account of tea and coffee, and it is cheering to notice how the experimental results coincide with general experience on the subject.

“To take tea before a meal is as absurd as not to take it after a meal, unless the system be at all times replete with nutritive material; and the fashion of the day of taking tea at about five o'clock can only be defended when there has been a hearty lunch at one or two o'clock and an anticipated dinner or supper at seven or eight o'clock” . . .

which are, by the way, the conditions under which it is usually taken now-a-days. It is delightful to see the absurd practice, not yet quite extinct, of having a “meat tea,” as it is called, authoritatively condemned; if one thing causes more indigestion than another it is to take tea during meals, and what is worst of all is to drink tea very hot; the stomach is not constructed to hold boiling water.

We come, lastly—for we have already dismissed Part III.—to a chapter on “Alcohols,” a short term for alcoholic liquors, for only one alcohol, chemically speaking, is discussed, fusel oil being only casually mentioned as a flavouring material. On this point we have only space to say that our author believes “that a further limitation in their use would be a great advantage,” and considers that the results of his numerous experiments show that the action of different spirits is very various, and even opposite, though their alcohol is the same, ethylic alcohol; a fact which, if confirmed by subsequent researches, points, as he says, to the very powerful action of the essential oils which they contain. More extended investigations into the physiological properties of these substances are much needed.

Throughout the book are interspersed a number of quaint recipes from *Cury* (fourteenth century), two of which we will reproduce:—

“For to kepe Venison fro Restyng [becoming tainted].

“Tak Venison wan yt ys newe, and caver it hastily wyth Fern, that no wynd may come thereto; and wan thou has yeven yt, led yt hom, and do yt in a soler that sonne ne wynd may come thereto; and dimembr' it, and do yt in a cleue water, and lef yt ther' half a day, and after do yt up on herdeles for to drie; and wan it ys

drye, tak salt and do after thy venison axit and do yt boyle in water that yt be so salt als water of the see and moche more, and after lat the water be cold that it be thynne, and thanne do thy Venison in the water; and lat yt be therein thre daies and thre nyzt, and after tak yt owt of the water and salt yt wyth drie salt, ryzt wel in a barel, and wan thy barel ys ful, caver it hastily that sunne ne wynd come thereto.”

The other on making an apple tart:—

“Tak gode applys, and gode spycis, and figys, and reysons, and perys (pears), and wan they are well ybrayed colour wyth saffron wel, and do yt in a cofyn, and do yt forth to bake wel.”

They knew how to make apple tarts in those days!

The book contains a very large amount of useful information in a small space, and the reader is assisted by a sufficiently copious index, and by no less than 156 diagrams, woodcuts, and tables. W. H. CORFIELD.

The Anthropology of St. Paul. (Die Anthropologie des Apostels Paulus und ihre Stellung innerhalb seiner Heilslehre, nach den vier Hauptbriefen dargestellt. Von Dr. Hermann Lüdemann. Kiel, 1872.)

THE problem Dr. Lüdemann sets himself to solve is this:—What are the constituent elements of human nature according to St. Paul? From what sources is his conception of these elements derived? And what place does that conception hold in his general theory of what is called the “scheme of salvation”? The answer given to these questions, so far as it can be ascertained from the four undoubted epistles, appears to be something of this kind:—

The physical basis of human nature, according to St. Paul, is *σάρξ*, or “the flesh,” which forms the material of the body, *σῶμα*, and is animated by the vital principle, *ψυχή*.

The “inner man,” as opposed to the “outer,” consists of *νοῦς*, or the thinking faculty, and *καρδία*, the heart or the emotions. Both these are purely neutral in character; they are neither good nor bad in themselves. They are a kind of “form” or function, which derives its ethical quality entirely from the content that is put into it.

Now, in man as naturally constituted the tendency is for this content to be taken from the *σάρξ*, or bodily appetites. The “inner man,” the “spirit of man,” his neutral personality, is, as it were, *possessed* by these, and so it becomes bad just as they are bad.

The only deliverance possible for man is that these bodily appetites, the flesh, should be *dispossessed*. And such a deliverance the Christian scheme of salvation affords. In taking upon Himself our human nature Christ did, indeed, assume the “sinful flesh” as well as other parts of it. He was made *ἐν ὁμοιωματι*—*Nachbildung*, as Dr. Lüdemann prefers to translate it—*συνεὸς ἀμαρτίας*. But the element of sin was from the very first held in check and prevented from becoming active by the presence of a higher power which in Jesus took the place of the human spirit, viz., the Spirit of God. And the significance of the Crucifixion consists in this, that in it the *σάρξ* as a “body of sin” was once for all destroyed (Rom. viii. 3),

and that from thenceforward the Spirit (*πνεῦμα θεοῦ, πνεῦμα Χριστοῦ, πνεῦμα ζωοποιούν*) was entirely free and unimpeded in its operation, not only transforming his natural body into a spiritual body, but also opening out to mankind a way of escape from the thralldom of the flesh. By partaking of this Spirit, and suffering it to dominate the neutral ground within him, the Christian obtains deliverance from the flesh; he rises to the life of the Spirit; and receives therewith a pledge of resurrection and immortality such as he has seen accomplished in the person of his Redeemer. In the language of St. Paul, "he dies and rises again" with Christ. The medium through which he is admitted to these privileges is Baptism (Rom. vi. 3, following). Though it should be noted, that here not only the mechanical act of baptism is meant, but the faith of which it is the guarantee, and which must continue in the baptised Christian. His life must be a continual mortifying of the flesh through faith in Christ.

The whole cast of this doctrine, as Dr. Lüdemann observes, is Hellenistic. It assumes a kind of dualism between *σάρξ* and *πνεῦμα*. In his struggle with *σάρξ* man is hardly a free agent; he cannot divest himself of it, though he must do so before he can obtain relief.

But by the side of the train of thought thus indicated there is another, different both in itself and in its origin. The word *σάρξ* has a wider and less ethically coloured sense than that which has hitherto been attributed to it. It is used in the O. T. as in the phrase "all flesh," i.e. "every creature," without any connotation of evil. And in this sense it is also used by St. Paul. Man, thus considered, is not prevented by any natural *a priori* incapacity from obeying the law of God. The very fact that the law is presented to him for his observance shows that he is free to accept it and to govern himself by it. But he finds by experience that he is unable to keep the law, which therefore passes its condemnation upon him. It (the Law, objectified) requires a satisfaction which he cannot pay, but which has been paid for him by the death of Christ. All attempts to eliminate the vicarious element from St. Paul's conception of the Atonement, Dr. Lüdemann regards as "hopeless and radically defective." The Christian obtains his share in the atonement of Christ through faith, i.e. a moral force based upon an intellectual conviction.

We have thus in the four great Epistles, but developed with especial distinctness in that to the Romans, two wholly different though parallel theories, springing from the two divergent senses of the word *σάρξ*; the one Hellenistic, the other Judaistic; the one involving a dualism, the other not; the one almost necessitarian, the other founded entirely upon free will; the one taking the shape of a mystical process, the other that of a juridical process.

Having arrived at these conclusions, Dr. Lüdemann is led to contest Holsten's statement as to the relative proportions of Hellenism and Judaism in the theology of St. Paul, as if he made use of the "religious categories" of the one, and of the "speculative categories" of the other. Rather, according

to Dr. Lüdemann, the two are co-ordinate, and St. Paul uses alternately both the religious and speculative categories of each.

At the same time, Dr. Lüdemann thinks he can trace a certain progression and development in the thought of the Apostle. The Hellenistic idea of an actual righteousness, superinduced by the operation of the Spirit, tends to displace the Jewish idea of a merely imputed righteousness. In the earlier Epistles the two ideas are found in a form not quite as yet clearly defined and matured. In the Epistle to the Romans, they are more completely rounded off and separated; but whereas the first four chapters are occupied chiefly by the Jewish idea, the Hellenistic comes in with the fifth, and predominates decisively as the Epistle proceeds.

Such is a rough sketch of the outline of Dr. Lüdemann's treatise. We have only to add that it is written with truly German care and thoroughness, and at the same time with admirable sharpness and precision. If the English reader be tempted to complain that it is hard reading, and to ask whether the object could not have been attained without quite such a formidable technical apparatus, it may be replied that this is due rather to the subject than to the writer; and if, on the other hand, it is objected, as in England is very likely to be the case, that the appearance of thoroughness is after all illusory, and that writers like Dr. Lüdemann import into St. Paul a scholasticism that does not really belong to him, to this objection, too, it may be replied by asking how such texts as Romans iii. 25, 26; vi. 3 following; viii. 3, are to be explained without the assumption of a ground-theory that may bear the name of scholastic. The fact is that when St. Paul wrote, the air was full of scholasticism, both Hellenistic and Jewish, and however much this may be absorbed with him by the interests of practical religion, it is none the less there, and forms the theoretical basis of his teaching.

Dr. Lüdemann ends his book by pointing out the value of the results arrived at in their bearing upon the development of Christian doctrine, and also as an index to the presence or absence in other writings of the peculiarly Pauline theology. We hope he may be induced to follow out this clue himself. No one could do so in a more genuinely scientific spirit, or with more thoroughly competent ability.

W. SANDAY.

NEW MAPS.

PRINCE LOUIS LUCIEN BONAPARTE has had in preparation for several years a linguistic map of Scotland, in which he proposes to show the limits of the Celtic speech on a somewhat different plan from that which I have adopted in the map in my *Dialects of Southern Scotland*. That map (a copy of which, along with a *résumé* of my researches on the present limits of the Celtic in Scotland, appeared in the German ethnographic journal *Globus*, Brunswick, January 1874) indicates by a line the outside boundary of the district within which Gaelic is still spoken by natives. The Prince proposes to take the parish as his area-unit, and to show by colouring, for each parish, whether the Celtic is still spoken within it, and whether as the ordinary language or only that of a minority. This plan will have the advantage of

showing definitely to the eye for any parish to what extent relatively Gaelic is still spoken there; the disadvantage, of colouring as mainly English a large parish over which as a whole Gaelic alone may be spoken, because English happens to be the predominant language of a town on its outskirts, as well as the disadvantage of representing a large parish as inhabited by a Gaelic minority, because a small corner of it may be included within the Celtic line. The comparison, however, of two maps constructed on these different plans ought to give very complete information as to the present position of the Celtic in North Britain.

If Prince L. L. Bonaparte's Scottish map come up at all to that which he has produced of the Basque dialects, it will be a splendid piece of work. His Basque map, or rather maps, are really magnificent specimens of what linguistic cartography ought to be, and are the result of years of personal research of the most patient and indefatigable character, involving a visit to every village in those Pyrenean valleys in which the relics of the ancient Iberian and Aquitanian are still spoken. The map shows the area occupied by each of the eight dialects (so-called—in Aryan philology they would be languages, for they differ from each other as widely as English and Dutch, or Spanish and Italian), the Biscayan, Guipuscoan, Northern High Navarrese, Southern High Navarrese, Labourdin, Western Low Navarrese, Eastern Low Navarrese, and Souletin. Although thus named from provinces, it is to be noted that the provincial and dialectic boundaries by no means coincide. Thus the Biscayan is spoken also in portions of Guipuscoa and Alava, the Guipuscoan in parts of Navarre, the West High Navarrese in parts of Guipuscoa, &c. Nor do these ancient idioms, relics of another and very different Europe from that of the last two thousand years, pay any more respect to the great political boundaries which have been recognised for long centuries. Four of the eastern dialects spurn the barrier of the Pyrenees, and claim sovereignty at once in France and Spain. The second and later map, however, is that which we regard especially as a triumph of linguistic geography. In this the author shows, by a novel and ingenious method of colouring, at once the eight dialects (i.e. languages), their twenty mutually intelligible sub-dialects (i.e. dialects), and their sixty clearly distinguished varieties. The local limits of each variety, generally the bottom of a valley, are distinctly marked; the intervening spaces where *no language* is spoken, for the good reason that there are no human inhabitants to speak, being left white, so that the map presents the appearance of a wide surface of little triangular and polygonal coloured islands scattered in strange array amid an all-enveloping sea of white. In examining these one is profoundly impressed with the isolation of these little linguistic areas, and the long distances from each other at which the sub-dialects and even the varieties of one dialect are found. For example, the most eastern dialect, the Souletin, is spoken, as its name imports, over the greater part of the commune of Soule in France; while far away across the Pyrenees we come upon a sub-dialect of the same in the valley of Roncal. Here also we see the oft-remarked phenomenon of the juxtaposition of very extensive with very minute linguistic areas. The Souletin is spoken over the whole district of Soule without any variation; in Roncal an area of not one-tenth of the size is cut up between three varieties, spoken respectively by two, two, and three little village communities in the narrow valley of the Ezca. The West Low Navarrese is also mainly a French dialect, spoken in two sub-dialects, over extensive districts in the valley of La Nive; but it has a Spanish sister sub-dialect spoken in nine villages in the mountain-girded valley of Aezcoa, separated from its French relations by rugged and inaccessible mountain barriers. Of the Labourdin, one variety is spoken both in France and Spain; it is that of the upper valley of La Nivelle, spoken in seven-

teen villages and hamlets; side by side with it a distinct variety exists in the French village of Ainhoue, while further north a form so distinct as to constitute a separate sub-dialect is confined to three villages south of Bayonne, in which town it may be mentioned that Basque is no longer native, though a very little distance up the Adour, the East Low Navarrese is met with in the valley of St. Pierre d'Irube. But all these and many other equally curious facts will crowd upon the student of the map itself; we only notice that Basque is no longer spoken over the whole of what are called the "Basque Provinces," the old language having totally disappeared in the less mountainous southern part of Navarre, and almost entirely from Alava. Here, as elsewhere also, it appears that large towns are hostile to a primitive language; the many sub-dialects and multitudinous varieties of South High Navarrese round Pamplona are spoken by a minority of the population, and the town itself is Spanish. Bayonne in the north, Bilbao far to the west, have similarly bereft the Basque of much of its territory, but it seems to be in Southern Navarre especially that the language is now struggling for existence. In conclusion, we have only to say that Prince Lucien's Basque map is without doubt the best piece of linguistic geography ever accomplished, and might well be in itself the work of an entire lifetime, instead of one only among some hundreds of contributions to the less-known languages and least-known dialects of Europe.

A beautifully executed and excellent wall-map, illustrating the caravan and other commercial routes of the East in ancient and modern times, has been constructed by John Yeats, LL.D., and is published by Messrs. Virtue & Co. Dr. Yeats was long known as the highly successful principal of a school in South London, in which he strove to reproduce for English boys the best features of the *Handels-Schulen* of Germany, with which he was intimately acquainted from practical experience. Having recently published a series of text-books embodying a course of commercial education, of which the first volume treats of the raw materials of commerce, the second of the history of the arts by which these raw materials have been adapted to the use of man, and the third and fourth of the geographical history of commerce, or history of interchange, and of the rise and progress of commercial nations from the earliest periods to the present day, he has, in pursuance of the same plans, prepared a series of wall-charts intended to illustrate various points of commercial history and geography. We hail the publication of such works, which tend to supply a lamentable void in English education: a void which, in the opinion of many competent judges will, unless filled up, and that speedily, soon lose for England that commercial supremacy which she has so long enjoyed, but will find it impossible to maintain against the specially trained merchants of Germany. J. A. H. MURRAY.

NOTES AND NEWS.

THE Old World is in imminent danger of being invaded by a new and very horrible insect pest. This is the Colorado or ten-lined potato-bug (*Dryophora decemlineata*). It was first noticed in 1861 as very destructive to the potatoes in Iowa. It is stated to have travelled east at about the rate of sixty miles a year, and in 1871 was said to have reached Canada and Ohio; it is now reported to be in New York State. It is believed to effect all its transformations in fifty days, so that a single pair would, if unmolested, produce sixty millions of progeny in a single season. The only remedy at present suggested as efficacious is almost as bad as the disease. Arsenite of copper (Scheele's green) mixed with eight to twelve parts of wheat-flour is to be dusted over the foliage of the potato-plant while wet with dew. In Wisconsin 1,200 pounds of this very dangerous substance were sold in one season for the de-

struction of the potato-bugs. However, seeing that they have the resources of German science at their back, English farmers will await the arrival of this very unpleasant visitor with hopeful impatience. Meanwhile the Government have been memorialised to prohibit the import of American potatoes altogether.

WHEN Captain Tupman, R.M.A. communicated to the Royal Astronomical Society the results of his observations of meteors during the three years 1869, 1870, and 1871, spent in a cruise in the Mediterranean, the wish was very generally expressed that the observations themselves should be published. This has now been done by the liberality of the British Association, and the details of 2,000 meteor tracks observed are made available for further discussion at any future time. Perhaps the most interesting point is that out of 102 radiants, corresponding to meteor streams observed by Captain Tupman, no less than 79 are identical with those determined by previous observers, leading to the conclusion that the catalogue of these strange streams of small bodies is now nearly complete. This valuable mass of observations shows what can be done, even without instrumental means, provided one object be kept steadily in view.

THE new observatory at Strassburg has inaugurated its career by the discovery of a minute comet, which was picked up by Professor Winnecke about five o'clock in the morning of February 21. This object is of course quite invisible to the naked eye, and is by far the smallest of the many similar bodies which Professor Winnecke has discovered.

THE Academy of Sciences of Vienna has published a paper in which Professor Oppolzer discusses the orbit of a periodical comet which was observed in 1858 and 1869, and which Winnecke showed to be identical with one seen in 1819, and to have a period of about 5½ years. As this comet has completed many revolutions since the time of its first discovery, it is a matter of some interest to examine whether in this case any action of a resisting medium can be traced which would be manifested by an approach to the sun and consequent acceleration of motion, a circumstance that has been actually observed in the case of Encke's comet. Professor Oppolzer has devoted himself to this task, but the result of his labours so far negatives the existence of any such effect; he has, however, not yet included the observations of 1869 in his results. Unfortunately it appears from the ephemeris which he has computed for the next apparition, that there is a very small chance of seeing the comet in 1875, its situation being very unfavourable, though it may possibly be picked up about February 5, if the weather is fine.

TAKING advantage of the clear sky of the North American continent, Mr. Langley has employed the fine equatorial of the Allegheny Observatory in a close scrutiny of the sun's surface, and has embodied the results he has arrived at in a paper communicated to the *American Journal of Science and Art*, the chief feature of which is a photographic copy of a very careful drawing of a portion of the sun's surface, representing the marvellous structure which is seen with high magnifying powers and under favourable circumstances, chiefly in the neighbourhood of spots.

It is some years since Nasmyth published his discovery that the photosphere or luminous surface of the sun was made up of an almost incredible number of spindle-shaped entities, which he compared to willow leaves, and to which the sun's light was really due, an announcement which gave rise to a remarkable controversy, in the course of which some observers of great experience flatly denied the existence of any such bodies, whilst others maintained that they had been seen long before; the general conclusion being that something of the kind was really to be seen, but that there was a far greater variety of form than Nasmyth's descrip-

tion implied. While giving a qualified assent to this view, Mr. Langley claims to have discovered still smaller bodies or granules (each about the size of Great Britain), by the agglomeration of which these willow leaves, or rice grains, are formed, producing the mottling usually seen on the sun. But it is the form assumed by these clusters in the neighbourhood of spots which throws most light on the constitution of the sun. Usually a spot on the sun consists of a black nucleus, surrounded by a grey penumbra something like the pupil and iris of the eye, and showing a similar radial structure, the clusters of granules being drawn out into filaments, sometimes of most fantastic shapes, but nearly always radiating to the centre of the spot. Mr. Langley's examination of these forms leads him to support the theory that sun-spots are in a great measure caused by cyclones on the solar surface, which lay bare the darker layer beneath and carry portions of the photosphere like wisps of cloud down with them. If we accept Mr. Langley's measures it would appear that the light of the sun is really due to one-fifth part of its surface only, the rest being comparatively dark.

WE understand that the noble map of the moon which, after thirty-four years of unintermittent labour, Dr. Schmidt of Athens has completed, will shortly be published, in a reduced form, with accompanying letterpress; and judging from a specimen of a portion of this chart, which has been exhibited in this country, the work will form an era in selenography. The original map, which is founded, we believe, on some thousands of drawings, is more than six feet in diameter and composed of twenty-five sections; these will be reduced in size by the aid of photography, so that none of the accuracy of the original will be lost; whilst the difficulty on the score of expense, which it was feared at one time might prevent the publication of this magnificent work, will thus be overcome.

IN the *Astronomische Nachrichten* Dr. Schmidt gives the results of the close watch he has kept on variable stars during the past year. When attention was first called to the strange change in the light of certain stars some years ago, several English observers took great pains in determining the periods of these variations of brightness, but as the novelty wore off, the field was left almost entirely to the Germans, amongst whom Dr. Schmidt shines pre-eminent in this branch of astronomy; the result of his labours, continued now for very many years, being to show that there is a wonderful irregularity in the seeming regularity of the changes, and that our only hope of solving the enigma is to keep a vigilant watch on these puzzling bodies.

Notwithstanding his labours at night, Dr. Schmidt has kept a faithful record of the number of sun-spots visible on each day, but since the application of photography to the delineation of the sun's disc, the value of such observations is very small. It is curious to notice his regret at having failed to obtain observations of the sun on twelve days, owing to clouds; as this included the whole of last year we may well envy the Athenians their climate.

Dr. Schmidt also contributes an interesting paper on the period of rotation of Jupiter, which seems to show some strange anomalies, partly due, no doubt, to drift of the spots selected, for as we cannot see the actual surface of this planet it is difficult to allow for the action of unknown currents in its atmosphere.

UNDER the title of "Heliopiktur," Dr. Stein describes, in the *Astronomische Nachrichten*, a contrivance, somewhat similar to one invented some years ago in France, for obtaining astronomical photographs without the necessity for a dark room. With very great care such plans may work fairly well, so long as everything is kept scrupulously clean, but the trouble involved in satisfying this condition would be much better spent in the ordinary manipulations. Though it

may do well enough as a toy for an amateur, no one would dream of using such a contrivance where really good work was required; as for its employment for the transit of Venus, which its author recommends, it is sufficient to remark that it is not adapted to the dry plate process, which experiment shows to be the best suited to the object in view.

M. PUISEUX has been appointed President of the Bureau des Longitudes at Paris for 1875, M. Faye vice-president, and M. Yvon Villaneau secretary and treasurer.

THE following new chairs have just been established at Universities and medical schools in France: one of pathological anatomy and histology at Montpellier, and one of therapeutics at Rennes and at Angers.

THE seventh session of the International Congress of Archaeology and Prehistoric Anthropology will be held at Stockholm from August 7 to 16, with the following programme:—August 7, opening meeting; 8th, the stone-age, palaeolithic epoch; 9th (Sunday), a visit to the museums of Stockholm; 10th, stone-age, neolithic epoch; 11th, excursion to Upsala, a visit to the museums of the University, and to a necropolis of the iron-age; 12th, the bronze-age; 13th, excursion to Bjørhoe (Îles de Bouleaux), to visit the remains of a city of the iron-age, the remains of a kitchen, and a necropolis of more than 2,000 tumuli; 14th, the iron-age; 15th, prehistoric anthropology; 16th (Sunday), closing meeting, and an excursion to the dolmens of the province of Visigothie. A grant of 20,000 francs, to cover the expenses of the Congress, has been asked of the Diet, and entertainments will be given by the town and the king.

THE Congress of Slavic Archaeology will be held at Kiev from August 14 to September 3.

DR. NEIL ARNOTT died on Monday last, aged eighty-five, and Dr. Forbes Winslow on the following day, at the age of sixty-four. A full obituary of both is given in the *Daily News* of the 5th instant.

THE Massachusetts Legislature has, says the *Nation*, appointed Mr. Alexander Agassiz to be his father's successor as trustee of the Museum of Comparative Zoology. A number of the leading citizens of Boston have undertaken to raise 300,000 dols. to make the museum emphatically a memorial of Professor Agassiz.

A SOCIETY for the introduction of cremation has been formed at Aarau, in Switzerland, and has already a long list of members. The movement is spreading, too, in Austria, especially at Vienna and Grätz, and seems to be extremely popular with all classes except the clergy.

WE regret to learn that the distinguished anatomist, Dr. Hyrtl, of Vienna, has been forced, in consequence of failing eyesight, to retire from his professional duties, and to accept the pension which the university grants in such cases.

ONE of the last acts of the late Government was to grant a pension of 150*l.* a year on the Civil List to Professor Sharpey, who has perhaps done more than any living teacher for the advancement of physiological knowledge.

ARTIFICIAL nests have been suspended in many of the trees in the Bois de Vincennes, near Paris, with a view of attracting birds that may prove useful in destroying insects. The attempt was first made last year, with the result of filling about sixty per cent. of the nests.

PROFESSOR NÖLDEKE contributes to the last number of the *Journal of the German Oriental Society*, xxvii. 4, two Syriac ballads on the capture of Jerusalem by Saladin, found in a Nestorian MS. from Urmia. They are interesting as showing the interest taken by the Christian East in the fortunes of the Latin kingdoms of Palestine, and the powerful effect produced by the

achievements of Barbarossa and Richard. To such an extent, indeed, was the cause of the Crusaders identified with that of all other Christians throughout the world, that the authors of these ballads, Nestorian Syrians though they were, regard the Pope as the champion of Christianity, and see in the overthrow of the soldiers of Rome the ruin of their own faith. Some other inedited Syriac fragments are published by Bickell, including the Poems of Cyrillona. Prætorius has three articles, one on certain inscriptions of Sargon, another on the belief in the immortality of the soul and the worship of dead heroes, particularly kings, among the inhabitants of Ilmyar, and a third on the Ethiopic particles *lali* and *ciyd*, which serve to express the nom. and acc. of the emphatic personal pronouns. The article deals a blow at the so-called Pronominal Theory, which has become so fashionable of late among a certain school of philologists, and shows that the one particle originally signified "an individual," and the other "the reins." Blau explains some "forgotten" Phœnician glosses in Dioscorides; Steinschneider has some notes on the *Kalilawe-Dimna*; Sayce gives a list of the Accadian numerals, comparing them with those of the Ugro-Altaic languages; and Schrader discusses various names of animals in Assyrian. Zunz sends an article which will interest the Biblical critic, in which he brings together a number of useful facts, and seeks to make out, among other things, the late date of Ezekiel and the recent Persian origin of Esther. Donner's article on composition in the Finnico-Ugrian dialects is highly suggestive. He points out that, so far from displaying a strong conservative immobility, they are largely subject to the action of phonetic decay and a musical vowel-change, which reminds us of the vowel-changes in Semitic. Changes in the meaning of roots are denoted in this way, and we are thus enabled to discover the original identity of roots the signification of which seems widely different.

To the next annual address of the President of the Philological Society on May 15, Mr. A. H. Sayce, of Queen's College, Oxford, will contribute a report on the Semitic languages, especially Assyrian; and Professor Robinson Ellis, of University College, London, a report on Latin.

WE hope to review very shortly M. François Lenormant's *Premières Civilisations*. The same indefatigable scholar has now published a work entitled *La Magie chez les Chaldéens et les Origines accadiennes*, based on the latest and most important documents bearing on the occult sciences and religions of the ancient world, and dealing with the important problems of the migrations of peoples, and of the origin of Asiatic civilisation.

THE last number of the new French periodical, *Mélanges d'Archéologie Égyptienne et Assyrienne*, contains an interesting article, by M. de Saulcy, on the Rutennu of the Egyptian Inscriptions. These people were at one time supposed to be the Assyrians, but the Greek transcript of the bilingual Decree of Canopus renders the Egyptian word by Syria. M. de Saulcy endeavours to show that the term included the length and breadth of Palestine from Cilicia to Egypt, and to identify it with the Lotan of Gen. xxxvi. 20, 22, who is there called the eldest son of Seir the Horite. This opinion seems very probable, and it suggests the further possibility that Lot, the father of Ammon and Moab, and Lud, the son of Shem, according to Gen. x. 22, are varying forms of the same word. One of the Aramaic tribes to the west of Babylonia, conquered by Sennacherib, was named Lihitai.

PART I. (dated 1873) of the publications of the English Dialect Society is now ready for delivery to all members whose subscriptions are not in arrear, the number of whom is very small. The whole number of members is now 221, and continues steadily to increase.

A good glossary of Leicestershire words was published many years ago by the late Dr. Evans,

of Market Bosworth. His son, Sebastian Evans, LL.D., has undertaken to prepare a second edition of this work for the English Dialect Society, to contain large additions. He notes that the dialect of the south-west portion of the county is very different from that of the north-east portion or "t'other soide" of it.

DR. EVANS has presented to the English Dialect Society a very valuable collection of glossaries, forty in number, including copies of the dictionaries of Coles, Phillips, Marchant and Gordon, Kersey, Martin, Knowles, &c.; also Blount's *Glossographia*, the *Craven Glossary*, the glossaries of Forby, Moor, Toone, Sternberg, Hunter, and others equally valuable, all well bound and in excellent condition. This generous present is a very acceptable addition to the Society's library, which will one day be a really good one.

DR. PEGGE'S *Glossary of Kenticisms and Proverbs relating to the county of Kent*, which had been sent to press for the Kentish Archaeological Society, is completed.

AT the sitting of the French Académie des Inscriptions et Belles Lettres on the 27th ult., a memoir by M. Henri Beaugue, on "The Spoils of Charles the Bold at Berne" was presented. The author states that, after the defeat of Duke Charles at Granson and Morat, the Swiss took a large booty, part of which is still preserved in various Swiss towns. The Museum at Berne in particular contains church ornaments, jewels from the duke's chapel, vestments, tapestry, and other articles of value, which then fell into the hands of the Swiss.

M. PAULIN PARIS read a paper on a work composed between 1360 and 1364, under the title of *Voir dit*, by the poet Guillaume de Machau. It consists of the correspondence between De Machau and a young lady called Peronelle d'Armentières, who fell in love with the poet from reading his works.

M. RENAN presented two documents relating to the Phœnician inscription from Eryx, which has been long lost, and is only known by Cordici's copy, incorrectly reproduced by Torremuzzo and Gesenius. Two tracings, one of the Palermo MS., and a second of another autograph of Cordici, prove that the inscription is not a funeral lamentation, but a simple dedication to Astarte.

M. RENAN also presented a collation of the Vatican MS. of Père du Bois' *De Recuperatione Terræ Sanctæ*, which renders possible the correction of sundry errors in the text as given by Bongars in *L'Histoire Littéraire de la France*, tome xxvi.; and copies of drawings, supposed to be hieroglyphics, found in the Canary Islands.

WE hear that the services of one of its ablest Chinese scholars have been lost to H.M.'s Consular Corps in China. Mr. William S. F. Mayers, Chinese Secretary and Translator in H.M.'s Legation at Peking, has accepted the post of Secretary to the Municipal Council at Shanghai.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY (March 2, 1874.)

SIR SIDNEY SMITH SAUNDERS, President, in the chair. Mr. McLachlan exhibited two male examples of an Orthopterous insect belonging to the family *Locustidae*. They were said to be sold in the streets of Shanghai, confined in ornamental wicker cages and bought for the sound they produced. The species appeared to be undescribed, and to pertain to a new genus, allied to *Xiphidium*. The president remarked that in Turkey, a kind of cricket was kept in a similar manner in paper cages and fed upon lettuce leaves. Mr. McLachlan also exhibited a series of examples, illustrating the natural history of *Oniscigaster Wakefieldi*, from New Zealand, described and figured by him from the female imago in the *Entomologist's Magazine* for October last. He had now received from Mr. Wakefield a second series of specimens, including

the male imago, female sub-imago, adult nymph and larva. The lateral wing-like horny expansions of the terminal segments of the abdomen in the imago and sub-imago are continued in the aquatic conditions on each segment of the abdomen, and in addition, there are similar formations along the back of the abdomen placed longitudinally and vertically. The adult nymph appears to possess no external gills or laminae, but they are conspicuous in the less mature larva on each side of the ventral surface of the abdomen. The Rev. A. E. Eaton exhibited some Arctic insects which he had brought from Spitzbergen; and also some photographs of the scenery in those desolate regions. A communication was received from Mr. J. V. Gooch respecting the injury to the coffee trees in Natal from a Longicorn beetle, *Anthores leuconotus*, Pascoe.

The following papers were communicated, viz. "On some new species of South African *Lycenidae*." By Roland Trimen, F.L.S. "Descriptions of new species of *Lycenidae* from his own collection." By W. C. Hewitson, F.L.S., F.Z.S. Part V. of the Transactions for 1873, concluding the volume, was on the table, and also Part I. of the Transactions for 1874.

LONDON ANTHROPOLOGICAL SOCIETY (Tuesday, March 3).

THE following papers were read:—1. A description of three Siah Posh Kafir Skulls, by Dr. I. Barnard Davis, F.R.S., who questioned Dr. Bellow's opinion that these Kafirs are of Hindoo origin, their skulls being of much larger internal capacity than those of the Hindoos. 2. On the Siah Posh Kafirs, hitherto supposed to be a Macedonian colony, planted by Alexander the Great in the Hindoo Kush, by Dr. G. W. Leitner, who gave a detailed account of this mysterious race, their manners, appearance, and their various dialects. He also referred to the desire which the Kafirs have to cultivate friendly relations with the English, and expressed his conviction that if we encouraged them we should not only have a direct and safe road for our trade to Central Asia, but should also be able to solve many puzzles in Geography and Ethnography.

SOCIETY OF BIBLICAL ARCHAEOLOGY (Tuesday, March 3).

DR. BIRCH, F.S.A., President, in the chair.—The following papers were read:—

1. "Translation of an Egyptian Fabulous Romance, 'The Tale of the Doomed Prince.' From the Harris Papyri." By C. W. Goodwin, M.A.—This curious romance, which is unfortunately only a fragment, relates how a certain Egyptian king, in answer to his earnest prayers, obtained a son, of whom the Seven Athors (Parcae) foretell that he will die by one of three deaths, either by a crocodile, a serpent, or a dog. To preserve his son, the king shuts him up in a tower with every luxury, and numerous attendants, who are charged to tell him nothing of the existence of these three animals. One day, the prince sees an Egyptian go forth to hunt, accompanied by his dog, whereupon the prince desires such an animal. This leads to the disclosure of his destiny; but he worries his father into letting him have his way, saying it is useless to fly from fate. After that he prevails upon the king to let him go out and see the world. Agreeably to this wish he travels alone to Naharanna (Mesopotamia), and passes as the son of an Egyptian horseman fleeing from the cruelty of a step-mother. Arrived at the court of the monarch of the country, he mingles with the courtiers, by whom he is told of the singular circumstances surrounding the king's daughter, who is shut up in a tower, from whence she can only be liberated by that lover who shall successfully scale the window of her prison. All the princes of Naharanna try to do this and fail; but the young Egyptian, whose personal appearance wins the heart of the princess, is successful. Upon this the king her father refuses to give her in marriage to an

unknown fugitive; but as she threatens suicide in the event of being refused, he consents, and the lovers are united. Soon after, the prince and his wife return to Egypt on a tour, and entering one of the temples to worship, he is attacked by a sacred crocodile, which he repels, and also by a giant, whom he overcomes. Weary with his exertions, the prince returns home to rest, while his wife watches beside him. Presently a serpent comes out of a hole to sting him during his sleep; but the princess offers the reptile some intoxicating drink, and when it is drunken, drowns the creature in her bath. On the prince awaking, he and his wife offer prayers and thanks for his deliverance from two of the foretold dooms. He then goes out for a walk, and is again met by the giant and crocodile, who warn him of his certain fate, to which he pays no heed. Two months afterwards the prince walks out, taking his dog with him. At this crisis the romance is suddenly broken off by the loss of the remainder of the papyrus. The learned translator drew attention to the peculiar features of this ancient story, resembling in so many points the romances of the mediæval period, which may have had a common origin. 2. "Translation of an Historical Narrative belonging to the Reign of Thothmes III." By C. W. Goodwin, M.A.—This translation, the original text of which is also contained in the Harris Papyri, relates the manner in which a certain chief officer of state, named Tahutia (*Thoth*), treacherously delivered up the fortress of the Imu (a people hitherto unknown to Egyptologists) to the armies of King Men-cheper-ra (Thothmes III.), and enumerates further the amount of the spoil thus surrendered, and the rewards obtained by the traitor. 3. "Observations upon the Assyrian Verbs Basu and Qabah." By Prof. William Wright.

ROYAL SOCIETY (Thursday, March 5).

A VERY important communication by Dr. Ferrier on the "Localisation of Function in the Brain" was presented by Professor Burdon Sanderson. It will be remembered that Dr. Ferrier's paper on the same subject at the Bradford meeting of the British Association excited the very greatest interest. The present communication contains the results of still further experiments, especially upon the brains of monkeys, as well as verifications of points which six months ago he was prepared to consider hypothetical. In a paper published by the author in the *West Riding Lunatic Asylum Medical Reports*, vol. iii. 1873, the results were given of experiments on rabbits, cats, and dogs, made specially for the purpose of testing the theory of Hughlings Jackson that localised and unilateral epilepsies are caused by irritation or "discharging lesions" of the grey matter of the hemispheres in the region of the corpus striatum. Besides confirming Hughlings Jackson's views, the author's researches indicated an exact localisation in the hemispheres of centres or regions for the carrying out of simple and complex muscular movements of a definite character, and described by him as of a purposive or expressional nature. Facts were also recorded tending to show that other regions of the brain were connected with sensory perception, but no localisation was definitely arrived at.

Among the experiments now related are some in further confirmation and extension of those already made on cats, dogs, and rabbits, as well as a new series of experiments on other vertebrates. In particular, numerous experiments on monkeys are described, for the purpose of which the author received a grant of money from the Council of the Royal Society. In addition, the results of experiments on jackals, guinea-pigs, rats, pigeons, frogs, toads, and fishes are narrated. The method of investigation consists in the application of the stimulus of an induced current of electricity directly to the surface of the brain. The animals are rendered only partially insensible during the process of exploration of the brain, complete anaesthesia annihilating all reaction.

Special attention is called to the precision with which a given result follows stimulation of a definite area, so much so that when once the brain has been accurately mapped out, the experimenter can predict with certainty the result of stimulation of a given region or centre. The theory that the phenomena are due, not to excitation of cortical centres, but to conduction of the electric currents to basal ganglia and motor tracts, is considered as disposed of by the fact of the precision and predictable character of the results, and by the marked differences in the phenomena which are observed when regions in close local relation to each other are excited. Other facts are pointed out bearing in the same direction, among others the harmony and homology subsisting between the results of experiment in all the different animals. The experiments on monkeys are first described. Reference is continually made in the description to figures of the brain, on which are delineated the position and extent of the regions, stimulation of which is followed by constant and definite results. Generally it may be stated that the centres for the movements of the limbs are situated in the convolutions bounding the Fissure of Rolando, viz. the ascending parietal convolution with its postero-parietal termination as far back as the parieto-occipital fissure, the ascending frontal and posterior termination of the superior frontal convolution. Centres for individual movements are differentiated in these convolutions. Further, in the ascending frontal convolution, on a level with the posterior termination of the middle frontal, are centres for certain facial muscles—viz. the zygomatici, &c. At the posterior termination of the inferior frontal convolution and corresponding part of the ascending frontal are the centres for various movements of the mouth and tongue. This is the homologue of "Broca's convolution."

In the superior frontal convolution in advance of the centres for certain movements of the arm, as well as in the corresponding part of the middle frontal convolution, are centres stimulation of which causes peculiar lateral movements of the head and eyes and dilatation of the pupils. The antero-frontal regions, with the inferior frontal and orbital convolutions, give no definite results.

Extirpation of these parts causes a condition resembling dementia. No results could be ascertained as regards the function of the Central lobe or Island of Reil. At the inferior angle of the intra-parietal sulcus is a centre for the platysma.

Irritation of the angular gyrus (*pli courbe*) causes certain movements of the eye-balls and pupils. Destruction of this convolution gives data for regarding it as the cerebral expansion of the optic nerve, and as such related to visual perception.

The phenomena resulting from irritation of the superior temporo-sphenoidal convolution are indications of excitation of ideas of sound. It is regarded as the cerebral termination of the auditory nerve. The sense of smell is localised in the uncinate convolution. The situation of the regions connected with sensations of taste and touch is not accurately defined, but some facts are given indicating their probable locality. The occipital lobes do not react on stimulation. Destruction of these lobes caused no loss of sensation or voluntary motion, but an apparent abolition of the instincts of self-preservation.

The corpora striata are shown to be motor in function and the optic thalami sensory. Stimulation of the corpora quadrigemina causes dilatation of the pupils, opisthotonic contractions, and the utterance of peculiar cries. The nature and significance of the phenomena is regarded as still obscure and requiring further investigation. Some experiments have been made on the cerebellum. They confirm the author's previous views as to the relation of this organ to co-ordination of the optic axes and the maintenance of bodily equilibrium. The experiments are not detailed, as they will be made the subject of a future paper. New

intermediate (iv) is found. When the accents shift (iá, uá) give rise initially to (ja, wa),—where (j) has its German sound,—with gradations. Hence (jeb'l, jel) *able, ale*, and (wæn won wæn, wets) for *one, oats*. When a consonant precedes, it is often changed; thus *team, dead* pass through (teem, deed) to (tiem trem tshem, died djed dzhed) reaching the last forms in Shropshire. All these changes are frequent in French, as in *champ* from (kamp-um, kiam kiam tsham sham sha.), *loi soi* &c. from (lee-gem see, lué sué, luá suá) &c., and Italian *uovo*, Spanish *huevo* from *or-um*, &c. The French *u* is itself a juncture from a fractured Latin *u*.

The *clausive* prefractures have the types (ái áu) from original (i, u), very frequently in English and German, occasionally in Guernsey French, but unknown in Scandinavian, Tuscan, &c. They graduate to (éi éú) which are common in dialects, where they have evolved generally a representative difference.

But the most singular change of (ái, áu) is to the *obscuration* (a'), (a') for (ái) occurring in Lothian, and (a') for (áu) in South Lancashire, while (a') juncturing into (a), we have (a) for both (ái áu), as (staa skaa raa) for *sty sky ury* in North and Mid Yorkshire, and (abaat aas) for *about house* in South Yorkshire. The usual European, and English juncture of (ái áu) is, however, (ee, oo), both open, which is the well-known Sanscrit *guna* change. But in English these junctures generally arise from sufractures. For speech takes no notice of origin, but deals with the sound gained as if original.

Sufractures consist essentially in allowing a vowel with a fuller reinforcement of partial tones to fall over into one with a less marked reinforcement. Hence the types are (ái áu) as the last, and (áiá). The two former chiefly appear in the graduated forms (éi éú) for (ee, oo) or (ee, oo), which may themselves have been originally junctures of sufractures. In the received dialect they frequently (according to some orthoëpists, invariably) replace (ee, oo) long, even when these are gradations of (aa) as in *face, stone* = (féis, stóun) according to Mr. Melville Bell, = (féeis, stóoun) according to Mr. Smart. The word *one*, originally *án*, which becomes (wón) in received English, prefractures to (án'n jén) in Southern Scotch and sufractures to (éin) in Caithness. In the Forest of Dean *name* sufractures to (náim), in South Yorkshire *good* or (good) to (góid), and throughout the East coast, (e), whether short or long, constantly drops into a very compact short (éi) as in (téil) for *tell*.

In received English, sufractures and their subsequent junctures arise from the omission of an original (r, l, gh, w). Thus *nearly really* actually rhyme, for to trill the *r* in *nearly* is a provincial error, hence the *omissive* fracture (i') is generated. In Hull (ri'lí) would be vulgar, because a sound in peasant speech, so (riili) is said, which is itself vulgar in London. Similarly in *fairly, sorely, poorly*, the *omissive* sufractures (e', o', u') are produced. *Balk* (baak) is a juncture from (ba'k), an *omissive* sufracture from (balk). In *may say* and the like, an original (-agh) palatalised into (-ái), an *omissive* sufracture, is still heard in Norfolk, Kent, and the South-West; and this is junctured into (ee, ee) even in Norfolk and Kent in many words, and also in received English, and fractured into (éi) in received English and markedly in Essex, but graduated into (ii) in the Midland counties, and even in Kent, where the three stages (ái, ee, ii) coexist in different words. It is strange to hear the words, *he is to die to-day*, pronounced in the east, south-east, and south-west of England. A perfectly similar change took place for (-aw-) and (-agh) labialised into (-áu), and hence giving an *omissive* sufracture, which graduated to (a') and gave (aa aa, oo, oo) as various junctures.

The origin of these prefractures and sufractures is not evident. They have not yet been sufficiently studied. In this paper Mr. Ellis gives what, so far as he knows, is the first connected view of their relations which has been published. An

immense mass of illustration will be furnished in the examples to his forthcoming section on English Dialects in the fourth part of his *Early English Pronunciation*. How far consonant contiguity, prospective or retrospective action of vowels in adjoining syllables, loudness or emphasis, pitch of voice, habits of intonation or alteration of pitch, drawling or rapidity of utterance, syllabic or vowel quantity, historic descent, foreign intermixture, climatic variety, social habits, fashion, segregation and aggregation, imitation of individual idiosyncracies, grammatical construction, and so on, may have assisted in producing these variations, remains to be discovered, and will perhaps some day reward a patient learned indefatigable phonologic scholar. At present it can only be said that the changes do not happen from slovenliness of speech, for they are clearly recognised as shibboleths of districts, nor from inability to pronounce the other "proper" sounds, for these frequently occur under other circumstances of gradation, and fracture and juncture, in the same dialect. Amidst the confusion, however, we may clearly discern a variety of sound dependent on phraseographical structure, by which shades of meaning are differentiated, and a feeling for acoustic propriety and harmony, which will have to be investigated. The object of this paper, which is but a condensed extract from a subsection of Mr. Ellis's forthcoming work, is, to place the problem before the world. The researches of Schmeller, Winkler, Ascoli, and Prince L. L. Bonaparte on High and Low German, Italic and Basque dialects must be taken into account. And the literary languages will then have to be ransacked. Enough has been adduced to show the nature of that dialectal fermentation from which alone a literary language results.

LINNEAN SOCIETY (Thursday, March 5).

At the special general meeting of the Linnean Society, held on Thursday evening last, the attendance was the largest within the recollection of any Fellow present, the number there being about 120. Mr. Busk, Vice President, occupied the chair. Mr. Carruthers, being called upon by the chairman, proposed a resolution that a committee be appointed to consider the bye-laws, and to propose to the council such alterations, omissions, or additions as they might think desirable. An amendment was proposed in the interests of the Council by Major-General Strachey, that the Council be requested to obtain competent legal opinion on the validity of the alterations recently made in the bye-laws, and to act upon the same—i.e. should the opinion be unfavourable to the changes that have been made, that the Council take measures to revise such changes. After considerable discussion, the amendment was carried by a large majority; and it is understood that the decision which will thus have to be obtained will be accepted by all sections of the Fellows. Before the close of the meeting a resolution was carried, proposed by Sir John Lubbock and seconded by Mr. Carruthers, expressive of the high sense entertained by the Society of the very great services rendered to it by its president, Mr. Bentham, during his long tenure of the chair.

FINE ART.

Biondo's '*Noble Art of Painting*.' [Michel Angelo Biondo della nobilissima Pittura. (Venice, 1549.) Translated into German, with a Preface and Notes, by Dr. Ilg, for the *Quellen-schriften für Kunstgeschichte*. 8vo. (Wien, 1873.)]

TIRABOSCHI says that if quantity and variety could be decisive of an author's literary value, Biondo would stand on a par with any writer of his age. From the mass of this scribbler's writings Dr. Ilg has chosen that which relates to art and translated it for the *Quellen-schriften*. The date of this handbook is

1549; it was issued from "the Apollo press" at Venice nineteen years before the 'Dialogue' of Dolce and one year after the 'Dialogue' of Pino; it is less valuable in every sense than either of those treatises.

Dr. Ilg very properly introduces Biondo in an apologetic tone. He admits that his statements scarcely enlarge the field of historical enquiry. He seems willing to confess that Biondo is a grotesque and tiresome talker, whose enthusiasm is as unreal as his knowledge is shallow; yet he opines that his work contains some material fit for the use of the present generation, and in this view we may concede that he is right. Still we are bound to keep in mind that there is more quartz than gold in Biondo; the quartz indeed exceeding the gold in such proportions as almost to justify Cicognara in holding that the yield of the "crush" is worthless and dull.

Biondo, like his contemporary Pino, held that painting was on the decline and required to be saved from total loss; but the means which suggested themselves to his mind for effecting this purpose were singularly feeble and insufficient. We are not sure that he was sincere, but he may have had reason to think that a remedy would be found in a reprint of recipes for the preparation of colours and in a compendium of fanciful subjects set forth for use in composition; but he was wrong, and *de facto* his object was not to be attained in that way. Mrs. Merrifield indeed has been induced to quote Biondo's recipes as illustrating the technical acquirements of painters in the sixteenth century, but it is almost certain that they were not familiar to the artists of the time, since, had they been so, they would not have been worth publishing. As for the subjects, they were left unused by those to whom they were suggested, and it was natural that this should be so.

Biondo was not a painter but a surgeon, whose delight was chiefly to see his rhapsodies in print. He was not very fortunate in finding encouragement for professional works treating of surgical operations or botany, so he turned his attention to "navigation and the winds," astrology, and "courtesans," in which perhaps his efforts were better rewarded. His attempt to enter the field of art was not justified in any way. He was not cognizant certainly of the pictorial business of his own time at Venice, or he would have felt the uselessness of recommending to the contemporaries of Titian, Tintoretto, or Schiavone the virtues of finished outlines, or the advantage of drawing first the skeleton, then the muscular development, and finally the fleshy projection of figures, preparatory to clothing them with drapery. It was not at a period when artists were expected to cover yards of canvas at short notice that such rules were likely to be accepted; and the attempt to urge them must have seemed very whimsical in the eyes of Biondo's readers, if he ever had any.

But Biondo was as ignorant of the history as he was of the spirit of painting in Venice or the rest of Italy. We may gather from his notices of Raphael, Michael Angelo, and Sebastian del Piombo that he had some acquaintance with the topography of Rome; but we can discern at the same time that he was unacquainted with Florence, had but shadowy reminiscences of Bologna and Mantua, and

was altogether unacquainted with Venice. He praises Titian for two of his portraits, Pordenone for a picture in a Roman palace, and he omits to speak of Bellini, Giorgione, Palma, Bonifacio, or any of the host of minor artists who made the Venetian school illustrious. He speaks of the greatest masterpiece of the previous age, *The Last Supper* by Da Vinci, in the Grazie at Milan, as a picture by Mantegna, and merely alludes to Lionardo as a Florentine who wrote a treatise on anatomy. We need not be surprised that a surgeon should take so quaint a view of the genius of a great master, but we ask, what claim he could urge to be heard as a writer on art? Of Francia, Biondo goes on to say that he was an admirable painter whose works were no longer in existence; and of Costa, that he was Francia's pupil,—an error into which Dr. Ilg has unconsciously allowed himself to be led by the author whom he comments.

What makes Biondo's handbook interesting and gives it a claim to a place on the bookshelves of students is the series of references which he makes to pictures and wall paintings by contemporaries in various parts of Rome. These references may be used to complete and to control the statements of Vasari in respect of Francesco Salviati, Perino del Vaga, Parmegianino, Polidoro da Caravaggio, and Maturino.

J. A. CROWE.

MINOR BOOKS ON ART.

Die Kunst im Hause. Von Jacob Falke. Second edition. (Wien: 1873.) That Jacob Falke's little book, *Die Kunst im Hause* (Art in the House), has reached a second edition would seem to show that the subject with which it deals is awakening attention and thought. In olden times houses really expressed something of the character and taste of the men who lived in them, generation after generation; but our modern dwellings, hired for the most part for short terms, usually express nothing but the fashion in vogue with the so-called "house-decorator" and upholsterer. We have grown content to leave our domestic art in their hands, as being the proper judges in the matter, and thus it happens that all our dwellings wear the same aspect. No one attempts to characterise the house he lives in, to give it an individual existence. It is one of a road, one of a street, or of a suburb, in all the houses of which we find the same prevailing decoration, however different may be the characters of their inhabitants. Some years ago drab was the favourite colour for the interior of houses. A dirty yellowish drab, or that frightful colour called "whitey-brown," was the cheerful livery assumed, especially by London houses; now more brilliant colours are in fashion, and we find rich red or green flock papers on the walls of dining-rooms, while drawing-rooms glitter with white-and-gold walls and crimson or yellow hangings. A lady's drawing-room, above all places, should be as individual to herself as the dress that she wears in it, but nowadays both too often merely represent the wealth of the husband who pays for them.

To such persons as are tired of this everlasting sameness in house decoration, and who are yet afraid to strike out a new mode for themselves, *Kunst im Hause* will prove useful. Experiments in the matter of carpets, wall-papers, &c. are, it must be owned, dangerous, and many of those unfortunate persons whom advertisements attack as "about to furnish" will be glad of a little advice on such difficult questions.

Dr. Falke, after describing in several chapters the "Graeco-Roman house," the "Dwellings of

the Middle Ages," the "Dwellings of the Sixteenth Century," the "Dwellings of the Seventeenth and Eighteenth Centuries," comes at last to the consideration of the modern house and its requirements. He discusses its floor, its walls, and its ceiling, and throws out many suggestions as to their artistic decoration. He especially objects to the white plaster ceiling, with the inevitable stucco ornament above the chandelier, and points out that a valuable field is here lost for artistic effect. By simply leaving the beams and rafters of the roof exposed and uneven, surface is gained that can be decorated in various styles. Carpets should be of unobtrusive pattern, and darker than the walls of the room, and the walls should not be very light (except when absolutely necessary in a dark room), but should form an harmonious setting for the various objects placed upon or against them.

With a little knowledge and study bestowed on the subject, even our ugly modern dwellings might be made artistic within. The outside, it is to be feared, must be given up as hopeless. Hitherto the chief concern of the Englishman in particular with regard to his house has been to make it comfortable. Comfort is the idea that our French neighbours attach especially to the English home, but why should the two ideas of art and comfort be incompatible? They are so truly, when classical or mediæval art is violently forced into the service of our modern work-a-day life; but surely there is no reason to cultivate ugliness as an inherent quality of comfort. The eye rests with greater comfort as well as greater pleasure on harmonious colours than upon inharmonious; tables and chairs wear as well of elegant as of inelegant design, and artistic decoration may be less costly than inartistic. We are, indeed, beginning to find this out. Art exhibitions and other recent incentives have produced a vast improvement in many branches of art industry, and have afforded, to a certain extent, to all classes an education for the taste that was formerly very difficult to attain. "There is no accounting for taste" is the doctrine of only bad taste—for that, indeed, there is no accounting—but good taste is chiefly a question of education. Most persons, it is true, have an aesthetic sense, but in some it is very weak, and in all it needs cultivation. Only by its cultivation can we hope to produce such a much-to-be-desired result as *Kunst im Hause*.

MARY M. HEATON.

The Erinyes (Die Erinyen: Berlin, 1874), by Adolf Rosenberg, is a very interesting study of the origin of the belief in these unamiable personages, of the development of the functions assigned to them in the Greek religion, and of their personal appearance as conceived on the one hand by poets, and on the other by artists. It is a contribution to the history of the religion and the art of the Greeks, and being short, compact, and furnished with the necessary illustrations, will doubtless be duly appreciated. To the many on whom, for example, the *Eumenides* of Aeschylus has made a deep impression it ought to be a welcome acquisition. The long list of works of art in which the Erinyes are represented consists, it will be noticed, entirely of vases and sarcophagi sculptured with reliefs. It will, therefore, be pardonable to add to it the bronze statuette of one of them in the British Museum which has escaped the author, the less to his blame as it does not appear to be published anywhere.

The Agonistic Temples of the Greeks (Die Agonaltempel der Griechen: München, 1874), by Leopold Julius, is published with the confession that its results have been anticipated in the recent admirable work of Petersen, *Die Kunst des Pheidias*. There are, however, some new facts in it, and, what is better, much less of the tone of rebuke adopted by Petersen towards a man who, however mistaken he may be in this instance, has still rendered the highest services to the study of Greek temple architecture. That man is C. Bötticher, the author of *Die Tektonik der Hellenen*, and the theory for which he is now so severely taken to task is that in which he separates the

Greek temples mainly into two classes, according as they were used for the purposes of worship or for purposes connected with the public games (Agonaltempel). As examples of the latter class he takes the Parthenon at Athens and the temple of Zeus at Olympia. As regards the Parthenon, it is a fact that part of it was employed for the deposit and preservation of public and private treasures, that there is no mention of a priesthood connected with it, or of religious rites conducted in it, and that the colossal chryselephantine statue of Athene within it could on emergency be stripped of its gold. So far, if it were not for the meagreness of our records on the subject of ancient religious rites, the non-sanctity of the Parthenon would be admitted as fairly established. Even Michaelis, whose authority on the point ought to possess great weight, accepts it as "the incontrovertible result of Bötticher's researches that no sacrifice took place in the temple." And again the peculiar sanctity which attached to the adjoining temple of Athene Polias (the Erechtheum) would incline most people to acquiesce in the theory that the Parthenon was not used for the worship of that goddess. But all this is a considerable step from proving that it was employed for purposes connected with the public games, and here the serious difficulties of Bötticher begin. His facts certainly point in the direction which he indicates, but they are so slender in themselves and so dependent for the rest on negative testimony that we are not surprised at the pretty general indignation with which his theory has been received. For example, he finds in the inventories of the treasures in the Parthenon mention of an ivory table which, as he can imagine no other use for it, he at once compares with the ivory table in the temple of Zeus and Olympia, on which the wreaths to be awarded to the victors at the games were placed. The table in the Parthenon must have been used for the same purpose, and here opens before him a grand picture of the victors in the Panathenaic games crowding into that temple to receive their wreaths in presence of the great statue of the goddess holding out a figure of Victory in her hand, and thus, as it were, blessing the achievements of each. If his facts are slender, his theory is anything but disagreeable, and perhaps it was the danger of its spreading under the sanction of his well-earned reputation that raised up so many assailants.

A. S. MURRAY.

THE PICTURES OF CHARLES I.

March 4, 1874.

The note which appeared in last week's *ACADEMY* with regard to the small pecuniary value placed upon the paintings of the best artists some two centuries ago may be verified to a certain extent by the particulars which have come down to us of the prices fetched at the sale of the pictures, &c., of Charles I. shortly after his execution. I am not aware that these particulars have yet been printed in any very accessible form, so perhaps a few of them may be given in these columns, together with some other new matter referring to the same subject. The information about the sale of these valuables is contained in a manuscript in the British Museum, a portion of the collection of the late Mr. Joseph Hunter, the well-known antiquary and historian of Hallamshire. The manuscript is said to be a copy from the "Certificates of the Contractors for the sale of the goods of the late King Charles to the Treasurers for the said sale." Each certificate was signed by three of the contractors, whose names were John Price, John Hales, Clement Kinnersley, William Allen, Daniel Norman, Henry Parr.

The following are a few literal extracts:—

1649. October 30.—To Colonel John Hutchinson, of Whitehall.
A Venus and Cupid; a man with one hand; a piece of oysters,—grapes, &c.; a piece of Harvest; Monsieur Duc D'Orleans and three others for 170*l*.

November 2.—To the same.
A statue, 40*l*. A piece of a Dutch Banquet, 7*l*.

- October 31.—To Mr. Jan Baptist.
A picture after the life by Tissian, 18*l*.
- October 31.—To Mr. John Baptist Jaspere, of Westminster.
A Cupid in a Looking Glass and Lucretia killing herself, 70*l*.; a Mary, 17*l*.
- November 2.—Mr. Jon Buscharal, of Nicolas Lane, London.
A Mary and a dead Christ, 30*l*.
A Noah's Flood, 40*l*.
Bouchenon's Picture, 3*l*. 10*s*.
- November 2.—To Mr. Beauchamp, of the Strand.
A Ruffin with a wine-glass; An Angel with a trumpet; A Piece of Grapes; 20*l*.
- November 7.—To Mr. Robert Aske, of Mary Axe, London.
Eve, Spinning, A Dish of Bacon, Vulcan, &c., and four Landscips, *in toto*, 37*l*.
- November 7.—To Mr. John Baron, of Westminster.
A picture being the Lady Ruthan, 5*l*.
- November 8.—To William Goble, of the Strand, London.
A picture of a Lady at length, 5*l*.
- November 9.—To Mr. John Baron, of Westminster.
A picture of a Christ, 35*l*.
- November 22.—To Roger Humphreys, of the Strand, London.
Three Landscips, 1*l*. 10*s*.
The King of France, 10*s*.
A perspective, 1*l*. 10*s*.
A Piece of Orpheus, 5*s*.
A naked Venus, 1*l*. 10*s*.
A Prince of Spain, 10*s*.
A French Lady, 1*l*.
A Cat done in Silk, 3*s*.
A Little Dog, 1*s*.
A Greenfinch, 2*s*.
An Ossation (*sic*), 1*s*.
- November 22.—To Mr. John Boulton, of Foster Lane, London.—Goods of Hampton Court.
6 Pieces of the Beattitudes, 6*l*.
An old Piece of Solomon, 1*l*.
Four Hawks' heads, 2*s*.
A Hawking Glove of King Henry VIII., 1*s*. 6*d*.
A Piece of King Charles on horseback, 40*l*.
&c. &c.
- December 20.—To Mr. John Fullerton, of Martin's Le Grand, London.
A cristal Dish of the Lower Jewell House, 70*l*.
- 1649-50. January 3.—To Mr. John Crooke, of Cheapside, London.
232 pearls taken out of the Imperial Crown, 320*l*.
- January 7.—To Mr. Henry Brown, of the Strand, London.
A Picture of King Edward the Sixth, 5*l*.
- January 17.—To Thomas Bustard, of the Strand, London.
A Picture of Argos, 2*l*.
- January 17.—To Mr. James Ginion, of the Strand.
Two Pieces of Bishops, 3*l*.
A Piece of Johosaphat, 15*s*.
&c. &c.
- January 28.—To Mr. Jan Baptist, of the Strand.
A Picture of Mars and Venus of Hampton Court duplicate, 11*l*.
- February 19.—To Mr. Harrington, draper, of Richmond, in Surrey.
A Picture of a Christ on a Cross, 4*l*.
- March 22.—To Mr. Jaspers Du Arcs, of White Friars.
A Picture of the Prince Elector and his Brother, 80*l*.
- March 22.—To Quarter Master General Gravenor.
A Picture of the Daughter of Pharo; A Madon and Child; A Cupid on Horseback in brass; A Geo. (*sic*) on horseback in brass, *in toto*, 102*l*.
- March 22.—To Mr. Jan Baptist.
A Lady and Christ and other Figures, 20*l*.
A Man in black, 30*l*.
A Christopher, 30*l*.
Ditto, 20*l*.
A Maculien, 5*l*.
King Henry the Eighth, 1*l*.
A Satyr and a Woman, 10*l*.
Mrs. Lamán, 20*l*.
And above 20 others.
1650. March 26.—To Mr. William Everard, of Covent Garden.
A Christ in the Garden, 16*l*.
- April 2.—To Mr. Joh. Baptista Jaspers, of the Strand.
Tissian's Picture, 100*l*.
- April 5.—To Mr. Robert Green, of Fleet Street, London, Ironmonger.
The King and Queen of Sweden; A German Duke, 3*l*.
- April 19.—To Mr. Jasper Du Artis, of the Strand, London.
Dorkas lying dead, 170*l*.
- April 26.—To Mr. William Clarke, of Martin's Lane, near Charing Cross.
The Four Evangelists, 2*l*.
&c.
- May 14.—To Cap. Gerce, of Cheapside, London.
The late King's Children, 120*l*.
A large picture of Diana and Calista, 22*l*.
&c. &c.
- June 21.—To Sir Bathierer Gebier, Knt.
The late King on horseback, 200*l*.
Charles the Fifth, Emperor, 150*l*.
1651. October 8.—To Mr. Robert Houghton, of Southwark.
A Nativity, 60*l*.
Christ and his Apostles, 300*l*.
A Gipsy Madona, 200*l*.
&c. &c.
- Oct ober 23.—To Major Edward Bass and others.
The Madona of Raphael, 2,000*l*.
&c.

Mr. Robert Houghton also buys "A Susanna" for 20*l*., "A Duke of Florence" for 50*l*., "A Madonna" for 800*l*., &c., &c. On the same day a "Mr. de Critz" makes many purchases, including "A Satyr by Coragio" for

1,000*l*. and seven statues for 1,300*l*.; and on November 18 "Mr. Eman. de Critz" and other creditors of the late King have many pictures and statues assigned to them for particular valuations, among them the "Marquis de Gawston" for 250*l*., and "Countess Mansfeld" for 20*l*. This must be the same Emanuel de Critz about whom, just after the Restoration, a representation was made to the King in reference to the place of Serjeant Painter, requested by him; 4,000*l*. was said to be due to his late father as Serjeant Painter, who had purchased the patent for his eldest son and servant, but both were dead, without getting any benefit from it. De Critz had also spent, according to his own version, 900*l*. in rescuing from Parliament the incomparable statue of the late King by Bernino, and 300*l*. more in buying in pictures, statues, &c., belonging to the late King, and which were now in the possession of Charles II. In Walpole's *Anecdotes of Painting* some account is given of John de Critz, Serjeant Painter to Charles I. In that work it is stated "De Critz and others were buyers of the King's goods to the value of 4,000*l*." Richard Symonds says that at De Critz's house in Austin-friars were three rooms full of the King's pictures."

At the time when the above representation was made, two other artists also brought themselves before the notice of Charles II. by petitions. The first, John Carwarden, prayed to be allowed to serve his Majesty as a "picture drawer," by which he had hitherto maintained himself, though injured by his loyalty: he had fought and been imprisoned in the late King's service. The other "picture drawer," Michael Cross, prays for a continuance of the stipend of 200*l*. a year, granted him by the late King, whom he had served 28 years in copying "old pieces of famous painters in Italy and Spain, and making new collections." Cross is the artist of whom it is told in Pilkington's *Dictionary of Painters*, that when at Venice he contrived to bring away the original of the Madonna of Raffaele in the Church of St. Mark, leaving his copy in its stead. The deception was discovered too late to regain the picture; for though several messengers pursued Cross expeditiously, they could not overtake him. The Spanish ambassador, it is said, bought the original picture for the King of Spain, who placed it in the Escorial. From the entry I have quoted above it would appear that the purchase of it, for 2,000*l*., was made through Major Edward Bass.

Some of the possessors of such undoubted bargains, as many of these purchases must have been, were perhaps in no great hurry to restore them to the next occupant of the throne. Vigorous efforts were, however, made to recover all the King's personal property, and in June 1662 a commission was issued to six persons, amongst whom was Elias Ashmole, to examine the accounts of the so-called

"contractors or treasurers for the sale of the late King's goods, viz. the crowns, jewels, plate, pictures, statues, wardrobe stuff, &c., formerly kept in the Tower and Whitehall jewel-houses, but forced from the persons to whom they were entrusted, and disposed of to those who were not creditors to the late King, and which are therefore not pardoned by the Act of Oblivion, and to demand from them the goods, or such moneys as were produced by the sale of the same; also to send for persons who hold the said goods, redeem them on reasonable satisfaction, &c."

The two following letters, written shortly after the Restoration, and now preserved amongst the State Papers, have an interesting connection with the same subject. The Earl of Sussex alluded to in them is better known to posterity as Thomas, Viscount Savile, of Howley, who played so notorious a part in the councils of Charles. Upon him the Parliament at first inflicted the heavy penalty on his estates of 8,000*l*., but afterwards were kind enough to take into consideration the fact that they had already, during the wars, damaged this same house at Howley (in Yorkshire) to the extent of 10,000*l*.; and so reduced the amount of his fine one-half.

"Most Honored Sir,

"Accordinge to your direction I have made enquire after those Pickters of the late Kings which my lord of Sussex bought at Somerset House, and I doe finde that all those Pickters are all taken out of the frames and the frames and them all lockt up in a Roome in Howlay house; the number of them I cannot certainly learne, neither would I bee too inquisitive least I should be discovered. I was by and present when my Lord of Sussex bought them, and they were conceivd to be the Cheifest Peices in Somerset house, save two, and as I remember hee told me they cost 2500*l*. I then told my Lord I hopt when it shall please God to restore the King againe you will give all these peices; he then answered and swore "by God, Cozen, I buy them for that very purpose." My Lady Temple, Sir Richard Temple's mother, at that very tyme stole a Pickter out of the Queen's Closet, and tyed it to her lace under her Petticoate, which was valued at 20*l*. I pray, Sir, if you have any commands for mee concerninge the Pickters, if you please to write by tuesday post next to Wakefeild, for I shall be gone out of this Country on Friday after, except I receive your commands concerning them, which if you doe I shall see them carefully put up. There is about 20 of them and very hansom frames, and all of one make. Sir, I never was any enformer before, but in this case I conceive I doe but the will of the dead and the duty and obedience I owe to my Prince, and within my speere there is noe subject that hee hath shall more faithfully serve his Mas^{ty} then my selfe, and see humbly craving your pardon for putting you to this trouble I humbly take leave and remain,

"Sir,

"Your most humble Servant,
"CHR. CLAPHAM.

"Wakefeild the 25th
"Augt 1660.

"To the right Hon^{ble} Sir Anthony Ashley Cooper, one of his Mas^{ties} Privie Councell at Westm. These humbly present."

[Copy]

"Sir Edward Nicholas to the Countess of Sussex.

"Madame,

"The late Earle your husband having formerly bought out of Somerset House severall pictures belonging to his Ma^{ty} to a great and very considerable value, which he was then heard to protest, that hee bought with no other designe then to restore to his Ma^{ty}, so soone as it should please God to settle him in a peacefull possession of his Kingdomes; and being certainly informed, that those pictures are at present in your house at Houlay; I am commanded by the King to send your Ladyship the enclosed Proclamation and in his Ma^{ties} name to desire, what otherwise you will perceive it commands, that they be forthwith restored to his Ma^{ty}. So not doubting of your Ladyships readynesse herein,

"I rest.

"Madame, &c."

[Endorsed—

"Mr. Sec^y to the Countesse of Sussex about y^r Kings Pictures."

Christopher Clapham, the writer of the first of these letters, was about this time made Clerk of the Peace for the West Riding. Whether his appointment was owing to the satisfactory manner in which he acquitted himself as "enformer" is a question which we need not consider too curiously.

J. J. CARTWRIGHT.

ART SALES.

THE sale of M. Szarvady's pictures at the Hôtel Drouot, on February 21, realised the following prices:—Two landscapes of Corot, 16,200 fr.; sylvan scene of Théodore Rousseau, 5,600 fr.; landscape of Jules Dupré, 4,250 fr. Among the old masters, the two Lucas Cranachs brought 7,100 fr.; a small Rembrandt, 2,510 fr.; two (Sigismund?) Holbeins, 1,850 fr.; a Breughel, 1,080 fr.; a Reynolds, 1,020 fr.; an *Entombment*, of Roger van der Weyden, 1,000 fr.; a *Marriage of St. Catherine*, of Polidoro Veneziano, 1,210 fr.; *Love's Triumph*, by Schorell, 2,400 fr.; a *Christ*, of Jordaens, 850 fr.; *Christ and the Woman of Samaria*, of Garofalo, 880 fr.; and *Sleeping Nymphs disturbed by Satyr*, which is believed to be the joint composition of Van Baalew, Breughel and Hessel, 1,500 fr.

At an important sale at the Hôtel Drouot on Thursday, Friday, and Saturday last, some high prices were realised:—*Fête in a Cottage*, A. van Ostade, 76,000 fr.; *The Little Pouter*, Greuze, 6,900 fr.; *Little Girl with a Neckhandkerchief*, Greuze, 10,000 fr.; *Custom-house*, Guardi, 8,600 fr.; *View from the Grand Canal*, Guardi, 5,900 fr.; *Barn-door Fowls*, Hondekoeter, 16,500 fr.; *Farm-yard Birds and Animals*, Hondekoeter, 10,100 fr.; *Cock and Hen*, Hondekoeter, 6,000 fr.; *Danse Champêtre*, Leclerc, 3,200 fr.; *Scene in Norway*, 4,900 fr.; *The Meal*, Tilborg, 8,800 fr.; *Game*, Weenix, 10,000 fr.; *Hilly Country*, Wynants, 6,750 fr.; *Le Jour de Réception*, E. Isabey, 3,000 fr.; *Faust and Marguerite*, 6,580 fr.; terra cotta group, Clodion, 7,500 fr.; terra cotta statuette, Clodion, 1,500 fr.; two Chimaeras, old china sea-green ware, 4,700 fr.; two vases of ancient Chinese porcelain, 3,150 fr.; vase of Oriental red porphyry, 3,400 fr.; Louis XVI. time-piece, 5,250 fr., &c.

A REPRESENTATION of a rustic wedding, by Jan Steen, said to be a very fine work and in a perfect state of preservation, the same painter's *Jesus driving the Buyers and Sellers from the Temple* and *Saint Nicholas*, a *Holy Family* by Domenico Puligo, and several other important works, chiefly of the Dutch and French schools, belonging to M. Lemaitre, were sold last Thursday at the Hôtel Drouot. The Lemaitre collection, according to the *Chronique*, resembles in many respects the Papin collection, the sale of which created so much talk in Paris last year. Both collections were made "slowly and silently," and appear to have been unknown for the most part to experts until brought under the hammer.

THE remaining portion of the collection of water-colour drawings and modern pictures of Mr. Edwin Heritage, of Denmark Hill, fell under the hammer at Messrs. Christie, Manson & Wood's, on Saturday. It comprised forty works of James Holland, of which the most attractive, a large drawing of the *Rialto*, sold for 246 guineas; a smaller, but of fine quality, *A Canal in Venice*, 156 guineas; four important examples of E. Duncan, two of which—*The Wreckers* and *The Life Boat*—produced 355 guineas; a very fine work of Copley Fielding, *Chepstow Castle*, went for 365 guineas; a picture by J. Holland, *The Colleoni Monument, Venice*, a *chef d'œuvre*, sold for 810 guineas; and a smaller painting of Venice by the same artist, 190 guineas. The total of the day's sale was 7,213*l.*—*Times*.

A CONSIDERABLE collection of miscellaneous water-colours was sold at Christie's on Monday, and also some sketches in oil by Constable, which realised high prices. A sale of *Liber Studiorum*, held the week before, contained many prints which were not first-rate, along with a few from recognised collections, such as Lord Gosford's.

NOTES AND NEWS.

A FINE collection of illuminated manuscripts is now on private view at the Burlington Fine Arts Club.

TWELVE of the larger architectural marbles from the Temple of Diana at Ephesus, which were conveyed last year to Malta in H.M.S. *Swiftsure*, have been brought to Portsmouth this week in H.M.S. *Revenge*, and were expected to arrive at the British Museum yesterday. Among these fragments are several portions of sculptured drums and sculptures from the Antae, as well as the square plinth on which the base of the Ionic column now in the Elgin Room originally rested.

WE regret to see that four paintings by Gainsborough were destroyed in the late fire at the Pantechnicon, including a picture of Sir Francis Sykes, of Basildon, two horses, groom and dog, all life-size.

THE *Débats* states that some very important frescoes by Perugino have been discovered in the cathedral at Corneto.

It appears that M. Clermont Ganneau's disco-

very was well-timed, as a second collection of specimens of Selim-el-Gari's workmanship was already made, and waiting in M. Shapira's custody to join its predecessor at the Museum of Berlin.

THE jewellery bequeathed to the city of Geneva by the late Duke of Brunswick is to be sold by public auction on April 22. The catalogue has just been issued, and comprises 326 items; among other curiosities are a sapphire statuette, and a Chinese idol in rubies from the Summer Palace at Peking.

AN important discovery of archaeological interest has been recently made in Norway. A tumulus, a few miles to the north of Frederikstadt, has been explored, and, embedded in a sort of stratum of firm clay at its base, has been found the hull of a vessel, made completely of oak, and evidently of great age. Both ends taper, so that it is difficult to tell the bows from the stern; the vessel, moreover, is rather "squat" and low in the water. The length of the keel is about 44 feet and the breadth of beam about 13 feet. Various circumstances combine to prove that it must have been a war vessel for coast use; it was propelled by oars and sails, and there are traces of elaborate carving about the sides. In accordance with an ancient practice in Sweden and Norway, allusion to which is made in some of the Sagas, the vessel was brought hither to cover the remains of its captain, fragments of whose dress, horse accoutrements and harness have been discovered.

This vessel evidently dates from the time of the old Vikings, and the Society of Antiquaries at Christiania, with a due regard for its historical and archaeological value, have caused the entire lot to be conveyed to Christiania with a view to its being set up within the precincts of the university.

A detailed description of this relic will be found in an English translation of a Norwegian pamphlet, published at Christiania under the title "The Ancient Vessel found in the parish of Tune, Norway."

A NUMBER of small sepulchres such as were used by the ancient Etruscans have been discovered by Signor Antonio Profeta-Ranfaldi, during the prosecution of his researches among the ruins of the ancient town of Erbita (near Aidone in Sicily), destroyed in 800. A hewn stone sarcophagus made without cement, and another in which there was still a little lime in the inner lining, were opened, and proved to contain, according to ancient custom, lamps, amulets, arms, painted vases, and statuettes of gods or heroes. Some of the less finished vases contained the lotus, the symbol of the Lotophagi, the mythical inhabitants of Sicily at a very early period. Gold rings, small knives, bronze nails, and pieces of money were also found, as well as two human crania of very small dimension. These latter have been sent to Professor Mantegazza, to assist him in determining the different types of men that have inhabited Sicily at different epochs.

THE new cathedral at Marseilles, now nearly completed, is in the same style as the original model for the church of St. Peter's at Rome, which was rejected in favour of the plan of the present building. This model is kept in a chapel on the summit of the platform of the dome, and is large enough for a person of ordinary stature to enter by stooping slightly. It is readily shown on application, and is the plan of a church in the Byzantine style, with domes, cupolas, and turrets.

THE exhibition of the Cercle de l'Union Artistique will remain open until March 15.

THE French Minister of Fine Arts has just presented to the Yacht Club of France several Sèvres vases to the value of 2,000 francs, to be distributed as prizes. Might not some of our English sporting clubs take the hint, and give beautiful china instead of ugly plate, to the winners of our modern Olympic games? Possibly,

however, it might be dangerous to deliver such frail beauty into the brawny hands of a successful muscular Christian.

FRENCH artists are very busy preparing for the Salon, the regulations of which have been made as little stringent as possible this year by the new Directeur of Fine Arts, whose popularity seems at present unbounded. Among the pictures to be exhibited we hear that there will be three portraits by Cabanel; two portraits and a female figure by Carolus Duran; some landscapes on the Thames by Jules Hieau; a harvest and a moonlight scene, and *The Battle of Waterloo*, by Phillippoteaux; a *Nymph*, by Jules Lefèvre; an *Alsatian Wedding*, by Jules Breton; *The Punishment of an Adulteress at Stamboul*, by Beaulieu; *The King's Festival*, by Lazerges; *An Episode at Sedan*, by Sergeant; *Horses going to the Stables*, by Emile Bazard; *Oyster-fishing at Cancale*, by Feytaud; *Saint Bruno*, by Laurens; *Painted Poems*, by Corot; some fine landscapes by Lansver and Daubigny; *Frederick II. playing the Flute*, by Gérôme; and some striking Spanish subjects in water-colour by Zacharie Astruc.

THE *Cologne Gazette* informs its readers, on the authority of a correspondent in Japan, that the Mikado is bent upon introducing the architecture of Western Europe into his capital, Yeddo, which, according to royal edicts, is now and in all future times to be known under the name of Tokei. Wood, paper and papier maché are to give way to more solid materials in the construction of new houses, and some of the richer Japanese traders have shown their acquiescence in their sovereign's wishes by causing ugly three-storied edifices to be erected by European workmen for their own use.

THE King of Bavaria has addressed an autograph letter to Professor Wilhelm Kaulbach, congratulating him on the celebration of the twenty-fifth year of his presidency over the Academy of Arts at Munich, and has presented him with the Grand Cross of the Order of Merit of St. Michael, in recognition of his great services in the cause of Art.

A COLLECTION of one hundred and thirty of the pictures of the lately deceased landscape painter, Edward Schleich, are at present on view in the halls of the Munich Society of Arts, where all the works that could be obtained, from the earliest sketches to the last and best-finished pieces of the artist, have been collected together, and form a highly interesting study, showing the gradual progress in that master of technical handling and in the vigour of style, which combined to place Schleich at the head of German landscape painters.

THE art critics of Vienna are divided in their opinion of Anselm Feuerbach's great picture, *The Battle of the Amazons*, which is now being exhibited in the Austrian capital. The subject is treated with a stern realism and classical simplicity which find fitting expression in the grandiose, almost colossal dimensions of the figures, and show more affinity with the artist's early work, "*The Death of Pietro Aretino*," than with the compositions which belong to the intermediate period, and are characterised by a closer adherence to the principles of the Renaissance school.

THE German papers state that some time since Abdul-Aziz gave an order to the well-known Munich brass-founder, Herr von Miller, for an equestrian statue, enjoining upon all concerned the strictest secrecy with regard to the commission. The order was duly executed, and the statue sent to Constantinople, where preparations were forthwith made for setting it up in the great square of the Seraglio. Such a storm of opposition has, however, been raised against the statue by all the Mollans and Muftis of the Ulema, and such remonstrances against the so-called "Christian idol" have been addressed to the Sultan, that Abdul-Aziz has been forced, for the sake of averting the danger of more serious

evidences of national displeasure, to order the removal of the offending object to an inner and secluded court of the palace. He has, however, testified his satisfaction with the manner in which Herr Miller executed his commission by sending him the order of the Medjid.

THE Viennese art critic of the *Allgemeine Zeitung* speaks with commendation of the portraits at present to be seen in the studios of Leubach and Angeli. The former, who is best known by his admirable portrait of Richard Wagner, has just completed an equally characteristic picture of Count Moltke; and widely different as are these two men, the striking individuality of each has been preserved with marvellous force and realism. Angeli, who is *par excellence* the Imperial and Royal painter of Germany, has, in the picture which he has just completed of the Crown Princess Victoria of Germany, produced one of the most graceful and best finished of the four hundred portraits that bear his name, and testify to the industry and success of a painter who has not completed his thirty-third year.

THE city of Paris has lately acquired four paintings by Raguenet, representing the Palace of the Tuileries, the Louvre, the isle of Saint Louis, taken from the Pont Notre-Dame, and the Hôtel Bretonvilliers. Raguenet was a master of great celebrity in his day, who confined himself almost exclusively to reproducing the various aspects of the city in which he lived. Ten of his most important paintings perished in the burning of a building annexed to the Hôtel de Ville, in 1870, but the large bathing-establishment known by the name of "La Samaritaine" possesses eight works by this master, and many others exist in private collections. They are valuable not only because of their real merit, but also on account of their great historic interest, as representing the Paris of Louis XV.

A FINE antique bust, which has been brought from Greece, and given to the Louvre by M. François Lenormant, has been added to that museum's fine collection of Greek sculpture. In spite of its defaced state, it is recognised as belonging to the noblest period of Greek art, and is supposed to be the head of a statue of Theseus or Hermes.

IN the *Annales du Cercle Archéologique de Mons*, M. L. Dosveld, the town architect of Mons, gives an interesting account of some Romanesque frescoes which he has discovered in the Château des Comtes at Mons. The Château des Comtes appears to be a very ancient building, and there seems little doubt that the remains of fresco painting discovered in it are early Christian work. M. Dosveld refers the paintings to the 11th century, or the first half of the 12th.

HANS MAKART recently undertook to paint a curtain for the new Comic Opera at Vienna, and accomplished a very graceful and charming work representing a procession of Bacchantes. When, however, the curtain came to be hung, it was found that the oil-colours in which he had painted it did not light well, and that the effect was by no means satisfactory. The artist, therefore, would not allow his curtain to remain even for a time, but at once withdrew it and decided to execute his design in some other technic.

THE Minister of Public Instruction in France has presented the entire collection of Braun's autotypes to the Ecole des Beaux-Arts. Such valuable reproductions as these have indeed an important influence in art-training, for they enable students who have not an opportunity of studying the great works of Italian art in the original to form a far more correct idea of them than can usually be gained by means of copies and engravings. They are, in fact, exact reproductions, and the Braun series is so large that it comprises almost every important painting in the Italian galleries, Sistine Chapel, and Vatican, besides the valuable collections of drawings by the old master in the Uffizi and elsewhere. The British Museum has a fine set

of Braun's autotypes. They ought, if possible, to be in every art school in the country.

A MARBLE group, which is now being exhibited in the Städel Institut at Frankfort-on-the-Main, is exciting great admiration among German critics. It is by the rising young artist Tendlau of Berlin, and represents a blooming boy sitting on the floor and playing with a large grotesque mask, which he is trying to put on to his own head. The motive is said to be most happily carried out, and the technical execution is highly praised.

WE have received the third part of *Art Workmanship*. The illustrations are well executed, and the work will no doubt be useful to the art manufacturers and others for whom it is intended. It is a pity that a little more pains have not been taken with the translation of the letterpress. Some of the sentences are almost unintelligible.

M. PIERRE VÉRON, in the *Monde Illustré*, gives some interesting particulars regarding Victor Hugo's manner of working. "He frequently," says this author, "carries a subject in his head for a year, turning, returning, and combining it. Then, when this gestation is done, he sets himself at once to his task, and writes, so to speak, with a single stroke, and as if a voice dictated to him, his verses or his prose." He once compared this mode of composition himself to a hen hatching her egg for twenty-one days, while the chicken breaks the shell in five minutes. "Pour moi," he said, "le travail est ainsi reparti; préparation lente, exécution instantanée." It has often happened, we are told, that he has written an act in verse of one of his dramas in a day, and each of his plays was written within the space of a fortnight. But we cannot tell how long the poet had been sitting on these marvellous chickens of his brain.

MR. CHAFFERS' *Marks and Monograms on Pottery and Porcelain* (4th edition, Beckers & Son, 1874) requires no further praise than is contained in the simple fact that it has reached a fourth edition. The volume is now increased to 1,000 pages, the additional matter and marks being chiefly derived from Mr. Drury Fortnum's Catalogue of the Majolica in the South Kensington Museum, M. Jacquemart's *Art Céramique*, Mr. Hugh Owen's work upon British Porcelain, and other new sources of information. We regret to observe that Mr. Chaffers, when alluding to the deep blue of Sèvres porcelain, persists, contrary to all precedent, in writing "bleu du roi" instead of "bleu de roi."

THE current number of the *Zeitschrift für Bildende Kunst* is poor both in literature and illustration. Perhaps the most interesting thing in it is an engraved portrait of a young man of intelligent countenance and pensive expression, with his head adorned, or rather burdened, with one of those fantastic caps familiar to us in portraits by Dürer and other mediaeval German artists. The portrait in question occurs in an altar-piece representing the martyrdom of St. Sebastian, by Hans Baldung Grien or Grün, and is supposed to represent the painter himself. The altar-piece, which is in the possession of Herr F. Lippmann, has been exhibited in the "Collection of Paintings by Old Masters in Private Possession" at Vienna, and with the other works of this most valuable collection receives a critical notice by O. Eisenmann.

An etching by W. Unger, from a marine piece supposed to be by J. Ruysdael, not equal to Unger's usual work, and a blotchy lithograph by Brabant, from a painting of Baalbeck by F. Fiedler, complete the large illustrations of the number.

Dr. G. Schaefer devotes a long article to the description and history of the "Einhard-Basilika at Michelstadt in Odenwald."

THE *Journal des Beaux-Arts* expects a great success this year for the Belgian Department at the International Exhibition. M. Charles Soubre, of Liège, will exhibit a great historical painting of Catharine of Arragon and Cardinal Wolsey.

Among *genre* paintings will be: *Les Orientales*, by Dell'Acqua, *Les Bohémiens*, by Van Keirsbilck, and works by Marckelback, Gérard, Cluysenaar, Hermans, and others. Animal painters will be represented by Mesdames Ronner and d'Espignies, and M. Charles Tshaggeny will exhibit a sketch of horses.

ACCORDING to the *Cologne Gazette*, the painter Johann Friedrich Maximilian von Waldeck has celebrated his 108th birthday—an encouraging precedent for all artists who aspire to longevity as well as to immortality. J. von Waldeck is said to have taken part in a voyage of discovery to South Africa in 1780, and to have served as a volunteer in the French wars of 1794. After various adventures in the shape of travels and explorations in Africa, Asia, and South America, he settled in Paris as a painter, and in 1826 received from the French Government a small pension, which he has continued to draw for nearly half a century. His last appearance as a contributor to the Paris exhibitions was in 1867, when at the age of 100 he sent in two pictures which he had then just completed.

THE *Nation* of February 19 criticises the three latest products of the sculptor's art in the United States. A statue of Elias Howe, inventor of the sewing machine, is a "mechanical bit of portraiture, without elevation and without art;" and some bas-reliefs of sewing-girls are "designed in the most modest style of familiar gravestone art." The utmost merit of a model of the Kosciusko statue, by M. Kwakowski, is that it shows "a kind of unbalanced inventiveness not yet ready for monumental work;" but Mr. Ward's *Putnam* is brilliant and vivacious. The same journal winces at learning that the artist of a bronze of Burns, just subscribed for by his countrymen in America, is to be Mr. Steell; remarking regretfully that few things are so impossible to destroy as a public statue once set up.

IT was proposed, some time since, to hold a centennial exhibition in Philadelphia, in 1876, to celebrate the foundation of the Republic, and a somewhat disingenuous attempt is now being made by the promoters to get a grant from the Government to meet the expenses of the undertaking. Their first step was, says the *Nation*, the creation of an executive committee of ninety politicians, "to whom stump oratory is the universal science, and Europe a vast gang of serfs ground down by corrupt despots." The *Nation* says very wisely of international exhibitions in America:—

"There is a special objection in the fact that the success of the United States is in no sense spectacular. No society in the world at this moment lends itself less to the production of scenic effects. It is not a brilliant society, in the sense in which European artists, manufacturers, and courtiers use the term. . . . We have few buildings of beauty or magnitude. Our cities are plain and badly kept. We have no great military force. Our great assemblies are not remarkable for any of the things that strike the artistic eye—splendour of dress or polish of manners. We have no class, as every country in Europe has, which has for generations made a study of appearances, and has reduced to an art the impressing of the imagination through clothing, behaviour, and ceremonial. In short, any attempt to describe our progress or condition through a great edifice and the arrangement of its contents would necessarily be a failure and misrepresentation."

THE STAGE.

MISS ELLEN TERRY AT THE QUEEN'S THEATRE.

IN his subtle and tender analysis of the work and sentiment of Joachim du Bellay, Mr. Pater says that from the magnificence of Rome the poet's thoughts went back continually to France, "to the smoking chimneys of his little village, the longer twilight of the north—*la douceur Anglaise*." The phrase puts prettily an old thought, not a new one—the thought of homesickness, "that

pre-eminently childish yet so suggestive sorrow, as significant of the final regret of all human creatures for the familiar earth and limited sky;" and then it is remarked how much imagination colours and intensifies such yearning. Du Bellay's thoughts went back to France, "yet not so much to the real France, with its dark streets and roofs of rough-hewn slate, as to that other country, with slender towers and more winding rivers, and trees like flowers, and softer sunshine on more gracefully proportioned fields and ways, which the fancy of the exile, and the pilgrim, and of the schoolboy far from home, and of those kept at home unwillingly, everywhere builds up before or behind them." That is a yearning commonly spoken of; not often realised in art of any kind. Twelve years or so ago, it formed the motive of a picture by Mr. Madox Brown—*The Last of England*—emigrants gazing from a ship's stern at the receding land; and now at the end of the third act of *The Wandering Heir*, at the Queen's Theatre, Miss Ellen Terry gives to one's commonly weak conception of it an intense and added consciousness due only to a moment of exquisite pathos.

A sympathetic voice, capable of very delicate tremulousness, and a face capable of finely-varied expression, are the instruments—the means—which enable Miss Terry to produce her effect. And at present she is perhaps more fortunate in the possession of the means, than skilled in the use of them. Nor is this at all to be wondered at, since skill in use comes only with the practice and the patient labour which for too long a time Miss Terry has denied herself. It would be idle to pretend that her play now exhibits quite the sure-footedness (if such a word may be allowed) which by this time it would have exhibited had the actress remained with no interruption on the London stage. Its effects would have been more certain, for they would have been the result of a more regulated art. But at the same time it would be misleading to deny that Miss Terry is now upon the whole a far more powerful and excellent actress than when she withdrew from the London stage in 1869. Nor, again, is this to be wondered at, for her withdrawal from the stage was altogether premature. She was an actress of great promise; not, thus far, of great performance. And as the spectacle is only too frequent of the return to the stage of players whose power is a thing of the past, it is well that we should be refreshed by the spectacle of the return to the stage of a sympathetic actress whose better power is a thing of the present—whose best may be a thing of the future.

We have mentioned one thing in the performance of Miss Ellen Terry, now before the town, which is done supremely well—that wistful look, that absorbed air—the eye of the mind, that sees England from America. Let us mention another, and then proceed, as best we may, to our more congenial task of fault-finding. It is the hysterical laughter; the involuntary outburst—her phrase "Isn't it laughable?" On Monday night this was done perfectly. Hysterics are very common—very much too common—on the stage, and generally they are overdone; an April shower ending like a tempest. But here either accurate art or accurate feeling—or both—kept Miss Ellen Terry right. It was not a fit of noisy hysterics, but a display of hysterical emotion, never wholly uncontrolled, and delicately true to life and art.

The faults are chiefly such as time may mend; there are certain deficiencies also, which are scarcely faults, but necessary drawbacks—the wrong side of a merit, so to speak. Persons who watch Miss Terry's acting carefully will discover these for themselves—will discover here and there an absence; here and there a note of uncertain power; indicating, now in one way and now in another, a limit beyond which the actress is not likely ever at any time to go, and yet permitting a wide enough range within which she may be content at all times to stay. Her expression at finding Annesley, when he is talking to the Irish-

woman, is wanting—or was, on Monday, wanting—in strength and reality. A minute afterwards, when Philippa thinks that Annesley is a little too cordial with this woman, the expression becomes strong and appropriate. The pose of assumed, somewhat contemptuous indifference under which there is plain the sense of jealousy, wrong, and resentment, is absolutely the right thing. The one thing is indifferently done, the other more than well done. How account for it, seeing that the earlier expression is just as much within Miss Ellen Terry's reach as the later? We account for it by our first statement, that the want of recent practice gives but uncertain command of instruments naturally fine; and more than once in the piece the same thing may be seen. Yet the actress is no more wanting in the power of feeling than in the power of expression. She fails, now and again, to realise the emotion proper to the moment, and then—unlike the actresses who are supported by the training and the practice of a dozen years—she has nothing to fall back upon. It is at once her merit and her deficiency that she keeps—to use a printer's phrase—nothing "in stereotype." The impression she records is a fresh one. If it is there, it is vivid. If it is not there, there is nothing to take the place of it.

So much, and nothing said about the liveliness, the capital spirits, the comic power—call it what you will—which should be so great a feature in every performance of Philippa, and which in this performance is so welcome a feature, because it is generally restrained by an excellent taste. Once, and once only, the liveliness is shown in a conventional way; or rather, the boy's sprightliness of the part is indicated by a strut and gesture which Miss Terry will do well to avoid. Philippa—for now the girl is in boy's disguise—wishes to assert her boyhood, and the conventional way to assert one's boyhood is to pull up one's collar (or one's scarf, failing that) and to set one's head, and to say, "Now I am a man." And this Miss Terry does, as a dozen actresses have done it before her. It is her worst moment. Generally her performance is full of archness and of point; pleasant malice that leaves no sting behind. If fault is to be found with her expression, it is that she expresses too much, not too little—that is, she sometimes pitches her comic acting in too high a key. While never even suggesting the idea of offence—as far from the licence of the music hall as from the awkward and stiff reticence of the beginner's first lesson—she is at times a little too pronounced; but it is a very little; much less than it was five years ago, when an actress of high promise neglected the opportunity, still happily within her reach, of taking up a lasting position on a stage which is not rich enough to suffer that promise to remain unfulfilled. F. WEDMORE.

IN many respects the most remarkable performance which our generation has witnessed was that of Monday last at Drury Lane, when, in compliment, or say rather in hearty friendliness, to Mr. Benjamin Webster, as man, artist, and stage-comrade, most of the famous actors of our day appeared in the *School for Scandal*. We have given the cast already, and all the world has commented on its strength. But before the task of criticising such a performance we shrink back. Such a thing, well begun, could hardly ever be well done, and if well done, it is scarcely too much to say that the critic's occupation would be "gone" as hopelessly as Othello's. It would involve, not an essay, but a volume, and this not on account of any supreme excellence, but on account of a combination of actors so unprecedented in our day, that after it one is inclined to say with Cleopatra that "there is nothing left remarkable beneath the visiting moon." Thinking of the list of great names in the play-bill, that, at all events, is true. But as great names do not always mean great performances, fault enough was no doubt to be found, except, indeed, with the generous intention, which, as it is the pleasantest

part of the whole thing, shall be the last to be mentioned.

WE are told that at the Strand they are rehearsing a comic drama, with which Mr. Reece, the well-known writer of burlesque, has furnished them.

Mr. Righton's Adventure with a Russian Princess is the new name of a little after-piece, not quite so new as its name, which is played at the Olympic in place of the last burlesque.

At the close of next week there will be an end of *Charity* at the Haymarket. It will be followed by *Queen Mab*, by Mr. George Godfrey, with whose work we are as yet unfamiliar.

A NEW after-piece, with a funny name, supports the *White Pilgrim* at the Court; or has supported it until to-night, when the *White Pilgrim* is withdrawn.

MISS WALLIS goes to the Adelphi Theatre, where they play, to-night and afterwards, a rearranged version of *Elizabeth*, or *the Exiles of Siberia*.

WE read in Sunday's *Débats* that it is doubtful whether the *Lion Amoureux* of Ponsard will be allowed to be reproduced at the Porte Saint-Martin Theatre. It is a patriotic play; not the play of a partisan.

NOTHING is more noticeable than the inactivity of the higher class writers for the stage in France. They are all idle. There is one notable exception—Sardou—and he is busy in destroying his claim to be considered of the "higher class." But our readers will recall that we have only, since the beginning of the year, had to call attention to one work of great consideration in Paris. That was *Jean de Thommeray*, by Emile Augier and Jules Sandeau; and *Jean de Thommeray* has not been thought thoroughly successful. The same period has given us in England original works by Mr. Hamilton Aidé, Mr. Wills, Mr. W. S. Gilbert, Mr. Merivale, and Mr. Gilbert à Beckett. Few of these, it may be, have been works to live; but at least they have been works to talk about; and that is more than can be said of *Le Magot* of Sardou.

Girofle-Girofla, the first piece by Lecocq since *La Fille de Madame Angot*, will be produced at Brussels during the present month, and in due time in Paris.

MR. W. COENEN'S CHAMBER CONCERTS.

THE second of these concerts, which took place last Wednesday, was in novelty and interest fully equal to the first. The programme included three important instrumental works, between which songs were introduced. It is probable that to the majority of the audience this second concert was more enjoyable than the preceding one, for it contained nothing so hard to be understood, or involving such a continuous strain upon the attention, as the quartett by Brahms, while out of the three large works performed, two at least had sufficient charm to prove attractive even to those who could hardly be strictly called musical hearers.

The concert opened with Miss Agnes Zimmermann's very clever Suite in D minor for piano, violin, and violoncello. This work was, if we mistake not, first produced a year or two since by Miss Zimmermann at her benefit concert. It is written with a skill and freedom which render it well worthy of a place in a concert devoted to the exposition of modern music. There is a certain antique tone about it, such as a "Suite" from its very nature requires, which effectively copies, without servile imitation, the style of the older masters. The "canon à la 7me" is very neatly worked, and the "air" which forms the fourth movement, though occasionally suggesting Mendelssohn, is both original and full of charm. The final "gigue," though very spirited, is slightly commonplace, and less valuable as music than the rest of the work, which, as a whole, is one

reflecting great credit on its composer. Of another "Suite" which followed, from the pen of M. Camille Saint-Saëns, organist of the Madeleine at Paris, it is impossible to speak so highly. While we thank Mr. Coenen for presenting a specimen of the work of a most distinguished French musician, we must add that the work itself failed to impress us favourably. Clever it undoubtedly is, but it is also terribly dull. For nearly half an hour the audience sat and listened to a succession of passages, often brilliant, always ingenious, but without a trace of anything which really appealed to the feelings. Berlioz tells a humorous story of his first hearing one of Cherubini's operas. At the end of the first act he called out, "I would give fifty francs for an idea!" At the end of the second, "One hundred francs for an idea!" At the end of the third, "Ah! it is no use; I am not rich enough!" and he walked out of the theatre. Something similar might be said of the suite of M. Saint-Saëns. Ample compensation was, however, made in the piece which concluded the evening, an octett for stringed instruments, by Johan S. Svendsen. This young composer is a native of Christiania, and is at present all but entirely unknown here. It is long since any work of such thorough and intense originality has been heard at any of our concerts as this octett. It is, in fact, so entirely a work *sui generis* that it is all but hopeless to attempt to describe it to those who were not present. Each of the four movements of which it consists is constructed on perfectly new and fresh themes, which do not in the least remind the hearer of anything he has ever heard before; and the treatment is hardly less original than the subjects. Several perfectly novel effects are produced by the combination of the pizzicato notes of the strings with those played by the bow. The only other composer with whom Svendsen bears any affinity is his countryman Edvard Grieg—and it is to be feared that this comparison will not much assist the majority of our readers, as Grieg's music has still to make its way here. Svendsen is by no means a voluminous composer, his published works being only eight or nine in number; and it is a curious thing that these are almost without exception either written for the orchestra or for stringed instruments. The octett was admirably played by Messrs. Wiener, Amor, Eayres, Jung, Zerbini, Stehling, Pettit, and Daubert, and excited the warmest enthusiasm. It is to be hoped that its success will lead to its repetition elsewhere. There is a most interesting symphony in D by the same composer which deserves a hearing, and which would be worthy of the attention of Mr. Manns at the Crystal Palace. It is almost unnecessary to say that the whole of the performances were characterised by the same excellence and finish as at the previous concert.

The vocal music of the evening was contributed by Miss Sophie Ferrari and Miss Dones. At the third and concluding concert of the series, next Wednesday week, are to be performed a string quartett by F. Gernsheim, a sonata for piano and violin by Bargiel, and a quintett for piano and wind instruments by Rubinstein.

The two most important features of the last Saturday Concert at the Crystal Palace were the first appearance of a very promising young pianist, Miss Emma Barnett, and the production of a new symphony by the writer of the present article. Miss Emma Barnett, who is a sister and pupil of the well-known pianist and composer, Mr. John Francis Barnett, chose for her *debut* Beethoven's Concerto in G. In so doing, she displayed no small amount of courage, which, however, was amply justified by the result. The difficult passages with which the work abounds were given not only with perfect technical finish, but with a combined delicacy and energy, as the composition required it, and such an evident appreciation of the spirit of the music, as to furnish a most favourable augury for the young lady's future career. The cadenzas which she introduced into

the first and last movements are the composition of her brother. While exceedingly brilliant and showy, they are in good keeping with the character of the work, on the themes of which they are largely constructed. Miss Barnett fully deserved the unanimous recall which followed her performance. The readers of the ACADEMY will, of course, not expect a criticism of the new symphony in these columns. It must suffice here to say that, thanks to the exertions of Mr. Manns, and the minute care he expended on its preparation, the performance was a most admirable one, and its reception by the audience very favourable—the composer being called forward at the close of the work. The remaining instrumental pieces were the overtures to *Anacreon* and *Masaniello*; the vocalists were Madame Lemmens Sherrington and Mr. George Bentham. This afternoon, in addition to the whole of Beethoven's *Egmont* music, Brahms's new "Variations for orchestra on a theme by Joseph Haydn" will be performed for the first time in this country.

The last Monday Popular Concert showed no falling off in the interest and variety of the music brought forward. Mr. Chappell must be warmly complimented on the enterprise he is showing in producing works hitherto neglected or overlooked. The announcement "first time at these concerts" is now to be met with in nearly every programme, and last Monday there were two pieces of which this statement was made. These were Schumann's Pianoforte Sonata in G minor (Op. 22), and Bach's Sonata in B minor for piano and violin. As a sonata writer Schumann appears on the whole to less advantage than in some other classes of composition. It seems as if his imagination was to a certain extent trammelled by the forms of what may be called the "regulation model"—first subject, second subject, developments, &c.; and hence, though all his sonatas are full of interest and contain great beauties, they fail as a whole to carry away the hearer, as do many of the pieces which Schumann has written in a freer form, such, for instance, as the best numbers of the "Phantasiestücke," the "Kreisleriana," or the "Novelletten." The sonata in G minor is nevertheless a most characteristic work, the second and third movements being especially charming. In the first allegro and the finale—the portions of the work in which the fetters of the conventional "form" press the most heavily—Schumann is less happy; and it is very characteristic that it is precisely the episodes which are the most "Schumannish," while the principal themes, excepting the second subject of the first movement, have less individuality about them than is generally the case with this composer. The sonata, which is in parts of no small difficulty, was admirably played by Mr. Dannreuther, a pianist whose ability is so well known as to render praise superfluous. Bach's Sonata in B minor for piano and violin is the first of a series of six which the old master wrote for these instruments. These all possess the same general features, being written in the strict contrapuntal style, and may be said to have a strong family likeness. But Bach knew, as no one else, how to combine the strictest counterpoint with the freest melody. In this respect no one has ever equalled Bach, though Mozart, Mendelssohn, and Schumann have occasionally approached him. Hence the great charm to musicians of his music. In the hands of two such artists as Mr. Dannreuther and Herr Joachim, the sonata in B minor made a deep impression, and will doubtless be heard again at these concerts. The other instrumental pieces of the evening were Beethoven's Quartett in C sharp minor, and Haydn's Quartett in G (Op. 64, No. 4). The former is one of the so-called "posthumous" quartetts, which until recently were so many sealed books to musicians. This arose in a great measure from their excessive difficulty. Thanks, however, to the rapid strides which technical proficiency has made of late years, this obstacle no longer exists. It may indeed be

said that to such artists as Messrs. Joachim, Ries, Straus, and Piatti, there is no such thing as difficulty. In listening to the quartett on Monday night, the enjoyment of the music was enhanced by the entire absence of any feeling of effort, and the wonderful current of Beethoven's inspiration seemed to flow from the strings as naturally and easily as if it were the merest bagatelle which was being performed. To speak of the work in detail would far exceed our limits; but reference should be made to the marvellous slow movement, written in the "free variation" form, which Beethoven so much affected in his later years; and to the *scherzo*, written in common instead of triple time—an innovation of which Beethoven was the inventor (his sonata in E flat, Op. 31, No. 3, furnishing the earliest instance), and which Mendelssohn has since turned to such good account in his "Scotch" symphony, and his Trio in C minor. Haydn's Quartett, an old favourite at these concerts, is one of the old gentleman's most genial works, and formed an excellent close to a most enjoyable evening. EBENEZER PROUT.

MR. MAPLESON has just issued his prospectus of the opera season at Drury Lane, which will commence on the 17th inst. But few novelties are promised, the most important being Balfe's *Il Talismano*, which was announced for last season, and in which the principal part will be sustained by Madame Christine Nilsson. Donizetti's *Roberto Devereux* is also to be revived after a lapse of nearly thirty years, with Mdlle. Titiens as Queen Elizabeth. The other promises are Auber's *Fra Diavolo* and *Caterina* ("Les Diamans de la Couronne"), Rossini's *Otello*, and Verdi's *Ernani*. Among the artistes announced to appear are Mdlle. Titiens, Madame Christine Nilsson, Mdlle. Alwina Valleria, Mdlle. Marie Roze, Mdlle. Risarelli, Mdlle. Bauermeister, Madame Trebelli-Bettini, Mdlle. Justine Macvitz, and Signori Fancelli, Naudin, Fabrini, Marchetti, Rinaldini, Campanini, Rota, Catalani, Campobello, Borella, Zoboli, Casaboni, and Agnesi. The list of those who will appear for the first time in London comprises the names of Mdles. Lodi and Singelli, Signori Paladini, Ramini, De Reschi, Galassi, Perkins, Costa, and Herr Behrens. Sir Michael Costa will, as hitherto, be conductor, Mr. Smythson chorus-master, and Signor Li Calsi "maestro al piano," while M. Sainton will be principal first violin.

DR. F. CHRYSANDER, whose arduous exertions in connection with the complete edition of Handel's works now in course of publication by the "German Handel Society" are well known to all musicians, has just superintended the issue of what forms a most valuable supplement to that edition. It consists of the whole of the concertos for stringed instruments known as the "Twelve Grand Concertos," in separate parts. The score had been already published in the new edition; but the parts necessary for performance were hitherto only to be had in the old, incorrect, and now somewhat scarce edition of Walsh, or in manuscript. Thanks to Dr. Chrysander, they are now obtainable in a clear and beautifully engraved edition, and it is to be both hoped and expected that these interesting works will in future more frequently find a place in our concert programmes than has hitherto been the case.

A CAPITAL story comes from Vienna *à propos* of Liszt's recent performances in that city. It is said that the great pianist found himself recently in the company of a number of ladies, who begged him in hyperbolic terms to procure for them "the ecstasies, the artistic raptures, which his magnificent talent inevitably produces." He obligingly seated himself at the piano and played. When he had finished some of his admirers had fainted. "Well," said Liszt, "I played wrong notes all through, intentionally; so badly, indeed, that I should have been turned out of doors at any elementary school of music!"

FROM a recent communication, addressed to the *Vienna Presse*, it appears that the new theatre which is being erected under Wagner's direction at Bayreuth is making but slow progress. Of the 300,000 thalers named as the probable cost of the undertaking, only about one-third has as yet been raised. This has been nearly all expended, but little more than the skeleton of the theatre is at present completed. The letter adds that Wagner hopes shortly to raise funds in Italy by the production of his *Rienzi*, a work which he thinks likely, both as regards its music and subject, to suit the taste of the Italians. On the other hand, the *Mannheim Journal*, the official organ of the Mannheim Wagner Society, states that it learns on the best authority that the success of the undertaking is now perfectly secure.

AT the conclusion of the season at Covent Garden Theatre on Saturday last, Mr. Gilbert H. Betjemann, the conductor, was presented by the members of his orchestra with a piece of plate as a token of their respect and esteem.

Lohengrin has been produced with success at the Royal Theatre at Stockholm for the first time.

POSTSCRIPT.

MR. GYE's prospectus of the Royal Italian Opera season at Covent Garden, which commences on the 31st instant, is just issued. It contains but few promises of importance. The list of artistes comprises the names of Mdles. Patti, Albani, and Marimon, and also of Madame Vilda (Frau Wilt, prima donna of the Imperial Opera at Vienna). Several other names, entirely unknown here, even by reputation, are mentioned, while Madame Pauline Lucca, in the words of the announcement, "is engaged to sing on April 8, but unfortunately her arrival in London is not considered certain." With regard to new or unfamiliar works, the promises are rather indefinite. It is intended to produce at least three of the following operas:—Verdi's *Luisa Miller*, Thomas's *Mignon*, Mozart's *Seraglio*, Puccini's *I Promessi Sposi*, and Glinka's *La Vie pour le Czar*. The conductors will be Signori Vianesi and Bevnigiani, and the leader Mr. Carrodus.

WE have received a letter from Dean Stanley on Dr. Beke's "Discovery" of Sinai, in which he characterises the identification of Sinai with a mountain on the eastern side of the Gulf of Akabah as "entirely destitute of foundation or probability."

MR. F. BURTON has been appointed to succeed Sir W. Boxall at the National Gallery.

HURST & BLACKETT'S NEW WORKS.

LIFE OF THE

RT. HON. SPENCER PERCEVAL.

Including his Correspondence.

By HIS GRANDSON, SPENCER WALPOLE.
2 vols. 8vo, with Portrait, 30s.

"This important biography will at once take rank in our political literature, both as a faithful reflection of the statesman and his period, as also for its philosophic, logical, and dramatic completeness."—*Morning Post*.

"In Mr. Perceval's biography his grandson has undoubtedly made a valuable addition to our Parliamentary history. The book is full of interest."—*Daily News*.

"We have to thank Mr. Walpole for a very valuable and interesting biography, and for doing justice to the memory of one who has too long been without it."—*Standard*.

"As a contribution to political and Parliamentary history, Mr. Spencer Walpole's work possesses considerable value."—*Saturday Review*.

VOLS. III. AND IV. OF THE
HISTORY OF TWO QUEENS: Catharine
of ARAGON and ANNE BOLEYN. By W. HEFORTH
DIXON. Demy 8vo, 30s., completing the work.

LODGE'S PEERAGE and BARONETAGE
for 1874. Under the Especial Patronage of HER MAJESTY,
and Corrected by the Nobility. Containing all the New
Creations. Forty-third Edition. 1 vol. with the Arms
beautifully engraved, 31s. 6d. bound, gilt edges.

"A work which corrects all errors of former works. It is a most
useful publication."—*Times*.

"A work of great value. It is the most faithful record we possess
of the aristocracy of the day."—*Post*.

MY RECOLLECTIONS, from 1806 to 1873.

By Lord WILLIAM PITT LENNOX. 2 vols. 8vo, 30s.

SPAIN and the SPANIARDS. By

AZAMAT-BATUK. 2 vols., 21s. [In the press.]

THE EXILES at ST. GERMAINS. By

the Author of "The Lady Shakerley." 1 vol., 7s. 6d.

"Picturesque, graphic, and entertaining."—*Post*.

THE NEW NOVELS.

BROKEN BONDS. By Hawley Smart,

Author of "Breezie Langton," "False Cards," &c. 3 vols.

VICTOR and VANQUISHED. By

MARY CECIL HAY. 3 vols.

"A pretty story. The interest is well sustained."—*Spectator*.

COLONEL DACRE. By the Author of

"Castle," &c. 3 vols.

"There is much that is attractive both in Colonel Dacre and the
simple-hearted girl whom he honours with his love."—*Athenaeum*.

TRANSMIGRATION. By Mortimer

COLLINS, Author of "Marquis and Merchant." 3 vols.

"This book will exercise a fascinating power over its readers."—*Hour*.

The BLUE RIBBON. By the Author of

"St. Olave's," &c. 3 vols.

"An admirable story. The character of the heroine is original and
skillfully worked out, and an interest is cast around her which never
flags. The sketches of society in a cathedral city are very vivid and
amusing."—*Morning Post*.

NATHANIEL VAUGHAN: PRIEST and

Man. By FREDERIKA MACDONALD, Author of "Xavier
and I," &c. 3 vols. [Just ready.]

CHEAP EDITIONS.

LITERATURE.

On Missions. A Lecture delivered in Westminster Abbey on December 3rd, 1873. By F. Max Müller, M.A., Professor of Comparative Philology at Oxford. With an Introductory Sermon by Arthur Penrhyn Stanley, D.D., Dean of Westminster. (London: Longmans, 1873.)

THIS pamphlet *On Missions*, the joint production of Dean Stanley and Professor Max Müller, reminds us of the Latin maxim, *suaviter in modo, fortiter in re*. Any one reading it without a knowledge of the circumstances under which the two discourses were delivered, will see in them only two elegant and eloquent studies on the subject of missions, the spirit in which they should be conducted, and the attitude which, to secure success, they must maintain towards non-Christian religions and civilisations. But for those who follow intelligently the movement of contemporary religious thought, this little publication will represent far more than this; they will see in it one of the decisive points in the great process of religious transformation which is one of the chief characteristics of the present age; and upon the success of which the religious future of modern society depends. Posterity will have to include one more link in its "chronological abridgments of modern history," and the unfortunate students of the twentieth or twenty-first century, whose memories will be still more severely taxed than ours, will have to retain the date, December 3rd, 1873, as that on which the lay professor, Max Müller, under the patronage of Dr. Stanley, Dean of Westminster, read in that church a lecture tending to the reform of Christian missions.

There is no room for self-deception: either the Christian tradition is irrevocably bound to its stereotyped forms of faith and worship, in which case the educated world—all the world, it is hoped, will be educated before long—will either gradually separate itself from Christianity or openly declare hostilities against it; or else Christianity, detached from the dogmatic and ceremonial forms of the past, will manifest itself as that which we believe it essentially is—that is to say, the mighty historical expression of pure human religion; and thus a new alternative will present itself, for the enlightened world will have to break with all religion, which we do not believe to be permanently possible, or it will again attach itself to Christianity, purified and become substantially identical with the abstract natural religion (in the natural sense of that word) inherent in the human mind.

The transformation of Christianity in itself is in a fair way of accomplishment; it is in the main a threefold emancipation from dogma, priesthood, and ceremonial. The Christian of our day refuses more and more

to admit that true communion with God depends upon the theological formula of his belief, upon his submission to a priesthood, or upon his observance of certain rites. On the other hand, it is becoming more and more apparent to all that the essential element in the Christian character and the Christian life is the religious and moral disposition of the soul, whose fundamental traits are visible in the historic personality of Jesus, and are briefly comprehended in intense love of God, the perfect Ideal, and of man called to spiritual growth in the image of God. We do not deceive ourselves as to the numberless obstacles cast in the way of this conception of Christianity by the habits, the prejudices, the interests, the moments of elevation not less than those of depression, which are periodically incident to the human mind. Still, it would be to close one's ears to the voices which come to us from the North, from the South, from the East and from the West, to refuse to see that such is really the direction followed ever more and more decisively by the religious thought of our times. The Sermon on the Mount is becoming once more the great religious charter of Christianity.

Two factors have mainly contributed to this spiritual revolution. *Within* the Christian community, the history and criticism of dogmas, the innumerable works on the Bible, the spirit of independence awakened and sustained by political liberalism—in a word, modern science applied to Christian tradition; *without*, the now deep and positive, though still quite recent, knowledge of non-Christian civilisations and religions. The immediate result of this knowledge has been that we have had to abandon the dualism between Christianity and other religions. We have been enabled, or, as I should express it, we have been compelled, to recognise its primacy, its supremacy, but we can no longer simply contrast it with all that is not itself, as light with darkness, Ormazd with Ahriman, God with Satan. The relative has taken the place of the absolute.

Hitherto, this renovation of the religious idea has remained theoretical, without any disturbing application to the traditional institutions, and the practical life of Christian societies. The great difficulties begin as soon as men perceive the grave modifications which this theoretical point of view, once admitted, cannot fail to render necessary in the conception of the Church—that is to say, the great organisation which has till the present day governed and centralised the vast majority of Christian consciences. Differences of Church government change but very partially the bearing of this result. Whether churches be *sacerdotal* like those of Rome, England,* and the East—that is to say, governed by a clergy claiming to be the exclusive and indispensable channel of divine grace; or whether they be *confessional*, like the Calvinistic and Lutheran Churches—that is, making this divine grace to depend upon adherence to a dogmatic confession—the result is the same. The

* I pass over here the question as to how far the Church of England is really and logically sacerdotal. Enough here that it passes as such in the opinion of foreigners, and in the belief of many of its members.

moment that the essence of the Christian character is no longer made to consist in close adherence to a dogma or a clergy, it is impossible for such churches to remain chained immovably to their past. A Pope said of the Jesuits when he was urged to reform them, "*Sint ut sunt, aut non sint.*" That may hold good of the Jesuits, but of churches we must say, "*Sint jam quod non fuerunt, aut non erunt.*" The great question that the future is called upon to solve is this: Will they have the power and the will to effect this transformation?

Now, that this transformation may be effected is our most fervent wish. We should consider the disappearance of these great societies an irreparable loss to mankind, nor do we see what could replace them. So all our sympathies are with those courageous men who, like Dean Stanley, place their knowledge, their eloquence, and their piety at the service of this reform. That in a Church with a sacerdotal organisation, like the established Church of England, the fact of a lecture delivered by a lay professor under the consecrated roof of Westminster, should have called forth expressions of surprise, indignation, scandal, does not astonish us in the least. There will long be in this Church, as in all others, men possessed by the spirit of routine, who find of all the passages in the Bible that the most difficult to understand in which Moses regrets that "all are not prophets in Israel." But those who esteem this passage as among the most spiritual and precious in the Old Testament must be rejoiced to see a breach made in the wall of sacerdotal prejudice, in what is considered abroad as one of its bulwarks. The more truly national the Church of England is—that is, the more open she is to all, and the more she calls forth in all the use of individual *χαρισματα*—the less sacerdotal will she become, and the more apostolic. And she will give a good example to other churches which have as much need as she has to go forth from their land of Egypt, of breaking the chains of dogma, without which they dream that no man can be saved. In outward appearance it is a small thing that an eminent layman, of world-wide reputation for his special science, should have spoken to other Christians for half-an-hour one evening in December, 1873, on a subject with which he is more competent to deal than any other man; in reality, it is a symptom of the situation and a sign of the times.

These general considerations are by no means irrelevant to the question of missions. The object of Professor Max Müller's lecture brings it under the category of applications of the modern Christian idea to the Christian institutions of the past. The same problem that the Christian Churches have to solve at home must be faced also by their missions, that is, by those important enterprises and institutions, founded by Catholic and Protestant Christendom in the hope of conquering to itself the vast regions lying under the dominion of other faiths. Here also the question must be asked, What is to be done?

It is clear, to begin with, that things cannot remain simply in the old groove. If troops are condemned to mark time on the same spot without advancing, they soon

cease even to mark time. The results attained by the great missionary enterprises dating in the Roman Church from the sixteenth, and in the Protestant Churches from the eighteenth century, are in reality extremely slender, if we compare the number and kind of the converts with the immense sacrifices made to obtain them. One fact is especially striking. The only cases in which Christian missions have acted with any degree of power have been upon populations of decidedly inferior race, previously untouched by any current of civilisation; and the question arises whether these youngest children of nature will survive their moral fusion with ourselves. More than one observation seems to answer in the negative; while, on the other hand, our western Christianity has failed to bring over more than an insignificant fraction of the population from any of those vast Moslem, Buddhist, or Brahminical societies which still cover the greater part of the inhabited globe. No account can be taken of the *baptised* Catholics of China and Japan, who are scarcely less idolatrous than the mass of their countrymen; and the work of Protestant missionaries, though it presents here and there truly gratifying results, cannot on the whole be regarded as much superior in fruitfulness. Our missions are in a position to which the old motto of the Jesuits might be applied, with an important variation: "Sint jam quod non fuerunt, aut non erunt."

Max Müller does not hold that they should cease to exist: "Non destruendae, sed reformandae." Without giving pain by an attack upon manifestations of sincerity and devotion which must always have a right to respect, he suggests the idea that their failure has been due to a fundamental misconception of the nature, the sources, and the value of the great moral powers which they attacked, with a faith not always *κατὰ γυναικιν*. The hope was entertained of renewing, in the far East, the era of the great apostolic conquests. It was forgotten that the marvellous spread of Christianity during the first centuries of its propagation was owing to a long series of intellectual, moral, and religious antecedents which had cleared the ground before it. In the middle ages the great conquests of the Church in the north of Europe (paralleled, however, by her enormous losses in the East and in Africa), were effected by the superior civilisation of the Latinised countries, and the incontestable prestige which that civilisation lent to the Latin religion, where they were not due simply to the sword of kings. Again, instead of sowing the seeds of Christianity, the missionaries have attempted to transplant it, like a tree in full flower, not without some attendant parasites. Instead of displaying the radiant beauty of the Christian character, they began by trying to impose upon Asiatics the whole of our western scholastic Christianity, the offspring of Aristotle and Plato as well as of Paul and Peter; and, naturally enough, failed to make any impression upon the masses, who were not only wholly unprepared to receive such a doctrine, but also profoundly imbued with a belief in their own superiority to the foreigners who had come so far to bring their strange or profane maxims. The supercilious rationalism of

the Mandarins, the arrogance of the Brahmins, the elaborate asceticism of the Buddhists, all looked down with equal contempt on Protestant dogmatism and Catholic ceremonial: the different orders of mind were too far apart for one to obtain a serious hold upon the other. Lastly, not only were the assertions of the missionaries who professed the doctrine of regeneration refuted by the living example of too many ostensible Christians, led into those distant countries by desires far other than the salvation of souls, but the preachers themselves not unfrequently gave occasion to learned Brahmins, Buddhists, and Mandarins to admire the audacity of the barbarians arriving from a strange land to attack religions with the very elements of which they were unacquainted.

What remains, however, as the Professor has not omitted eloquently to point out, is the indirect influence exercised by the spirit of Christianity, especially when seconded by the truly Christian character of its missionaries, upon the ideas, the laws, and the manners of these ancient communities. There are domestic movements of religious reformation, like the *Brahma-Somāj*, to which the missionaries pay too little regard, because they do not favour their own special dogma or ritual, though they appear full of hope to all who are capable of understanding that Christianity is more a matter of character than of doctrine or ceremonies. Nothing can be more suggestive than the considerations cautiously thrown out in this direction by the learned Oxford Professor, and on the general thesis we are completely of his opinion. Missions must become, primarily and principally, expositions of Christian life; they must be devoted to the instruction and moral preparation of the populations amongst which they are established: their essential business is the *Bildung*, the civilising education of their future converts; to act otherwise is to begin building the house at the roof. The profession of Christianity ought to be only a crowning of the edifice.

There are, however, two points concerning which we have to submit, not an objection, but a doubt, to the eminent Professor.

Hitherto the great incentive to missionary enterprise, both amongst those who actually take part in missions and in those who support them by abundant subscriptions, has been the desire, in itself most laudable, of rescuing from eternal damnation the souls that were hastening thither by thousands every day for want of knowing the only doctrines and observances by which they could be saved. Will the same generosity and the same special devotion be forthcoming when the object proposed is only the preliminary task of elevating the social and moral condition of the so-called heathen populations?

Agreeing with Professor Max Müller as to the end, I should have wished for more precise explanation respecting the means. The missionary cannot exactly place himself in front of a non-Christian people and say: "Look at me; observe how well I live, and contract the desire to live as I do." It is possible and desirable that such a reflection should suggest itself to spectators, but the mission, to justify its establishment to itself, must

have some further programme than this. But what is the programme to be? If all that is to be done is to open schools, to found charitable institutions, to introduce the natives to our civilisation and our social life, cannot the State take the place of the Church in this work, which is rather social than religious, and will it not probably insist on doing so?

After all, these questions may be left to the care of the future. The first thing is to know what is the good to be done; the best means of doing it may be discussed at leisure. Besides, the non-Christian peoples are not the only ones who ought to profit by our contact with them. The Christians too have something to learn, and may owe to other nations a more just, true, and philosophical conception of their own religion. The science of comparative religion, including with the history of dogma, is the great source of the revelation demanded by the present time. It has often been observed in countries of extensive colonisation, that in distant colonies Europeans often lose the traditional faith which they had brought from Europe with their other goods. The sight of these religions, older, sometimes more widely spread, even more fertile in miracles and legends, than popular Christianity, deprived the Christian religion, in their minds, of that absolute worth which the catechism of their childhood had taught them to assign to it. Believers at starting, they returned home sceptical or indifferent. Something of the same kind happens to those who at the present day attach themselves in a superficial spirit to the science of comparative religion: Christianity soon comes to seem to them a religion like the rest, one out of many, with little to choose between them.

But we need not look upon this consequence as necessary: we may rather hold that it disappears before a profounder comparison. In reality Christianity emerges from the rest as the *supreme* religion. It is based upon the sentiment of the filial relation of man to God, or, if the language of philosophy be preferred, upon the relationship, the *homœousia* of the human mind and the Divine. Hence the two great pillars of the edifice, the love of God and the love of man. And thus it is that, without ignoring the elements of truth and sublimity to be found in the religions of the law (Judaism and Mahomedanism), in the religion of the love of man without the love of God (Buddhism), even in the haughtiest of aristocratic religions (Brahminism), the evangelical Christian still persists in proclaiming the supremacy of the religion of grace, by which man feels himself no longer a slave, under judgment and separate from God, but a son, called to realise in himself and others the ideal of truth, justice and mercy, which is nothing else than the glorious face of the Heavenly Father. It is in this sense that, whatever ulterior transformations they may undergo, Christian missions will last as long as Christianity itself. ALBERT RÉVILLE.

THE French Academy of the Moral and Political Sciences, at a meeting on the 7th instant, elected M. Geffroi to the seat rendered vacant by the death of M. Amédée Thierry, and M. Masé in place of M. Odillon Barrot.

TIM BOBBIN'S "HUMAN PASSIONS."

Human Passions Delineated, in above 120 Figures, Droll, Satirical, and Humorous, designed in the Hogarthian style, very useful for young practitioners in Drawing. By Timo. Bobbin, Author of *The Lancashire Dialect*. Published, as the Act directs, May 1773. [New Edition. Published by John Heywood, Se., Excelsior Works, Manchester. Folio.]

At one time it was common to speak of John Collier ("Tim Bobbin") as the Lancashire Hogarth. No more inappropriate designation could have been selected. He lacked not only the artistic skill of Hogarth, but that moral indignation which made the pencil more powerful than the preacher's voice in denouncing sin and folly. Collier rarely deviates into moral purpose. His indignation is chiefly reserved for Church pluralists, of whom he had a hearty detestation, partly to be explained by the fact (given in his own words) that he was "one of the nine children of a poor curate in Lancashire, whose stipend never amounted to thirty pounds a year, and consequently the family must feel the iron tooth of penury, with a witness. This, indeed, was sometimes blunted by the charitable disposition of the good rector (the Rev. Mr. H——n W——n); so this Tim Bobbin lived as some other boys did, content with water pottage, buttermilk, and jannock, till he was between thirteen and fourteen years of age, when Providence began to smile on him, in his advancement to a pair of Dutch looms, when he met with treacle to his pottage and sometimes a little in his buttermilk or thinly spread on his jannock." The recollection of the biting poverty of his father's house still edged his teeth when he drew this *Book of Heads*, and the most popular composition it contains is "The Pluralist and the Old Soldier." This plate is dated as having been designed and engraved by the author in 1770, and published with the others in May 1773. It is accompanied by verses stating that—

"A soldier maimed and in the Beggar's List,
Did thus address a well-fed Pluralist.
Sol. At Guadaloupe my Leg and Thigh I lost,
No Pension have I tho' its Right I boast;
Your Reverence please some Charity bestow,
Hev'n will pay double. . . when you're there—
you know.
Plu. Hev'n pay me double! Vagrant know that I
No'er give to Strollers they're so apt to lye:
Your Parish and some Work would you become,
So haste away or Constable's your Doom."

There is more to the same purpose. These lines are only quoted because the entire poem was printed as the description of a satirical print, with the same title, published by M. Darly, in 1766, four years earlier than the date assigned for his "invention" by Collier. From his letters he appears to have been painting this picture in 1767. This leads us to speak of the origin of the book.

Collier was a free-living man, eagerly looking out for means to cure

"That eternal want of pence
Which vexes public men."

Accordingly, he painted altar-pieces and tavern signs, but chiefly grotesque heads, which he sold to innkeepers and others. Many of them were exported to the colonies. It may serve to show the appreciation of art

in Lancashire to say that Collier advertises in his book:

"Gentlemen, &c. may have any Plate or Plates, Painted on Canvas or Pasteboard as large as the life, from 6s. to 15s. a Head by sending their Orders to the Author, near Rochdale."

The ready sale which these pictures met with suggested the idea of engraving them, and the result was this book. In 1858 the original plates came into the possession of Mr. Heywood, who issued an edition, which is again reproduced in the present year. The plates are considerably the worse for wear. The designs for the most part are grotesque and farcical, outstepping the modesty of nature, monstrous libels upon humanity. There are occasional glimpses of better things, but the work is valuable, not for artistic merit, which is almost wholly wanting, but for the light which it throws upon the social life of Lancashire a hundred years ago. The picture is not a pleasant one, and suggests an age drunken, unclean, cynical, and coarse. Sudden clowns, lecherous justices, simoniacal parsons, lustful priests, cowardly generals, foolish men, and women sometimes immodest and always ungraceful, make up Collier's pictorial world. His *Lancashire Dialect* is equally cynical. On this I have spoken elsewhere (see my *Folk Song of Lancashire*, p. 22). There are some political caricatures which need explanation. The present issue is put forth without any editorial care whatever. In this we cannot think the publisher has done well; for the work should have been made a complete collection of the pictorial efforts of Tim Bobbin. The addition of the etchings illustrating his prose works, and a brief commentary upon such of the pictures as need elucidation, would have given a value to this edition which at present it does not possess.

WILLIAM E. A. AXON.

Comparative Politics. Six Lectures read before the Royal Institution in January and February 1873. With the Unity of History, the Rede Lecture read before the University of Cambridge, May 29, 1872. By Edward A. Freeman, M.A., Hon. D.C.L., late Fellow of Trinity College, Oxford. (London: Macmillan and Co.)

MR. FREEMAN explains that this volume is an "attempt to claim for political institutions a right to a scientific treatment of exactly the same kind as that which has been so successfully applied to language, to mythology, and to the progress of culture." The moderation of this language might very well become the founder of a new science, but is in this case perhaps needless, as other eminent writers have already made us familiar with the comparative treatment of early political history. And indeed, as Mr. Freeman himself tells us, this new science of Comparative Politics is merely a branch of another science which Mr. Freeman, from a becoming regard to the purity of our language, declines to name, but which he identifies by a reference to Mr. Tylor's enquiries into the primitive history of Society. One is inclined to sympathise with Mr. Freeman's objections to the term "Sociology," and at the same time to marvel

that he should exhibit entire satisfaction with his own coinage.

Mr. Freeman limits his investigations to the history of the Greek, Italian, and Teutonic races; and in his preface he frankly states that many things will probably be found in the lectures and notes which have been already said both by himself and other writers. Perhaps this statement might safely have been made stronger, as with some questionable exceptions there is little stated which could not be found in some very accessible form; but that is of course unavoidable by a popular lecturer traversing such well-trodden ground as Greek and Roman history, or even the early history of the Teutonic races (so far at least as Mr. Freeman deals with it); and as to the frequent reference to Mr. Freeman's own works, that is both explained and justified by the principle expounded in the preface, that "the best and most successful writers are always those who have the least scruple in putting forth the truths they have to enforce over and over again."

The leading truth which Mr. Freeman conceives himself to have established, and by the establishment of which he proposes to show the propriety of treating political institutions scientifically, is that "Greeks, Italians, and Teutons have a large common stock of institutions, institutions whose likeness cannot otherwise be accounted for than by the supposition of their common primitive origin." He leaves it to others to say how far these institutions are common to the whole Aryan race, "to the races of the Eastern hemisphere, or to the whole of mankind." Of course so important an enquiry could not be entered upon without a preliminary investigation of method, and Mr. Freeman consequently devotes the bulk of his first two lectures to the consideration of his method, and the range and limits of its application. He commences by a somewhat general account of the application of the comparative method to language, mythology, and culture, which presents no particular novelty, and then proceeds to deal with his special subject. He points out in the first place that although the basis of the investigation is the likeness, often unexpected, which appears between political institutions of remote times and places, we must guard against being misled by resemblances which may arise either from conscious imitation, or from the independent operation of similar causes. These cases he illustrates with an unnecessary variety of examples, but he does not dwell so much as could have been wished on the means of distinguishing resemblances arising from similar causes from resemblances inherited from a common stock. This, indeed, is the point on which the enquiry turns, and Mr. Freeman displays a due sense of its importance. He points out that the most satisfactory proof of institutions being descended from a common primitive type would be the inheritance of a common name; but as this, it appears, almost never happens, he is driven to assume the defensive, and prove that the absence of a common name is exactly what we might expect. Although, however, Mr. Freeman is obliged to admit that we find few or no cases in which the actual names of any offices are akin in the three

languages, "we shall find," he adds, "that most of them can be traced to common roots, and that there are several cases in which names, though they are not cognate with one another, yet certainly translate one another." What Mr. Freeman means is that "rex" and βασιλεύς translate each other, and are translated by "king," just as the same venerable words would be used, no doubt, to translate the correct native designation of the King of Ashantee. But though this is, doubtless, a remarkable fact, it does not help us much, as the same thing would apply to cases of similarity arising from any cause, and the whole point is to distinguish between cases of similarity arising from different causes. We must fall back therefore, it appears, upon the assumption that when we find nations with a plainly common derivation of their language, mythology, and arts of life, and with similar points of resemblance between their political institutions, we may conclude that these latter also owe their likeness to a common inheritance. This looks a little like begging the question, and it would perhaps have been better had Mr. Freeman here commenced his scientific treatment; but we may gather that he felt a good deal hampered by his position, as at the end of his first lecture he admits apologetically, but unnecessarily, that his matter had hitherto been of a kind that carried with it a "strain on the mind."

Turning, however, from Mr. Freeman's method to his results, which occupy the remaining lectures, we find that his scope is far wider than we could have guessed from the first two lectures, and the preface. Mr. Freeman not only points out those institutions belonging to the three races which may be considered part of a common heritage, but discourses occasionally at some length upon the analogies and differences presented by their later development. In his fourth lecture, for example, he ranges from the kings of Heroic Greece to the American presidents; and the Assembly is treated in an equally comprehensive spirit. Indeed, looking to the great space devoted to later history in the last four lectures, I am not without doubt that I may have described the aim of the book incorrectly; but the preface is entitled to weight in ascertaining Mr. Freeman's intentions; and the first two lectures, which on the whole afford the clearest marks of design, point unquestionably to an investigation into primitive history. We may, therefore, assume that Mr. Freeman's disquisitions upon the later political institutions are subordinate to the main problem of the common Aryan heritage; and indeed it looks sometimes as if he had drifted into a discussion of them, in an effort to show that not they, but an earlier state of affairs, ought to form the basis of his comparisons. In his third lecture, for example, after a little preliminary discussion of the different conceptions of the state embodied in the city of ancient Greece and the nation of modern times, he proceeds to prove what might indeed, as he justly remarks, have been "inferred without historical evidence at all," that the city was not the earliest political organisation we can find traces of in Greek history. And then he again addresses himself to a discus-

sion of the results of the city upon later Greek history before proceeding to an examination of the earlier organisations. Of course this plan has the great advantage of presenting frequent opportunities for eloquent passages, which greatly relieve the tedium of sober scientific treatment, but on the other hand it sometimes interposes provoking obstacles in the way of a person who is in serious quest of the common Aryan heritage.

The point from which Mr. Freeman starts in his account of those institutions which he thinks were inherited by the different races from their common ancestors, is the family; not, however, the family as a single household, but as grown into a *gens* or clan; and this *gens* or clan, where it adopts a more settled life, assumes the form of the village community. We have thus the *γένος*, the *gens*, and the *mark* or *Gemeinde*, as the primitive political unit in the Greek, Italian, and Teutonic state. But these again we find comprehended in larger aggregations, represented by the Roman *curia* and tribe, the Greek *φάρρία* and *φυλή* and Teutonic hundred and *Gau*; and here, says Mr. Freeman, the parallelism ceases. "In Greece and Italy the union of the tribes formed only the city; among all the branches of the Teutonic stock the union of tribes formed the nation." It is right, however, to say that Mr. Freeman does not seem quite clear as to the original character of the intermediate division between the tribe and the *gens*; and he is also greatly tempted to make the hundred equivalent to the Roman *centuria* (by which, since no explanation is offered, one would naturally suppose that he means the well-known unit of the Servian organisation).

"Both names," says Mr. Freeman, "in their historic use are mere survivals; neither the hundred nor the century, as we know them, answer to a real hundred of anything; but every name must have had a real meaning when it was first given, and there must have been a time when the hundred or century must have been a real hundred or century of something, whether of houses or families or fighting men."

This opens a tolerably wide field for conjecture, and until the nature of the hundred or century is a little better ascertained, we fear we must be content with the *gens* or mark; and the tribe, shire, or *Gau*, as the primitive elements of the Aryan state. About these, however, Mr. Freeman is quite clear; and he is also certain that the greater is an aggregation of the smaller, not the smaller a division of the greater. One would think that Mr. Freeman supposed the *gentes* to have appeared in a sporadic fashion, and to have afterwards joined themselves into tribes; but it is more probable that he merely intends to protest against the marks or *gentes* being regarded as the results of a deliberate artificial division. It would, however, have been satisfactory to have a more definite statement of the relation of the *gens* to the tribe at the time when there marched together in one great company "the forefathers of Camillus and Brennus, of Vercingetorix and Caesar;" and it would also have been better had Mr. Freeman given us an account of the points in which the *mark* and *Gau* resemble the tribe and *gens*. As it is,

we must be satisfied with the fact that there is a tribe and *gens* in Greece and Italy, and a *Gau* and mark in Germany, and that they are the same things, though they are not called by the same name. "There is a river in Macedon, and there is also moreover a river in Monmouth; it is called Wye in Monmouth, but it is out of my brains what is the name of the other river, but 'tis all one." One is sometimes inclined to wish that Mr. Freeman's parallels resembled Fluellen's as much in brevity as in some other points.

We get a still more slender contribution to our common institutions from the lecture on the King. Mr. Freeman proves very conclusively that there were kings in Greece, and kings in Rome; but on turning to the Teutonic branch we find all hope of a common origin for the kingly office destroyed by the admission that here at least kings were not of immemorial antiquity. Mr. Freeman, however, makes a gallant attempt to save something out of the fire by suggesting that before the kings there might be a kingly house, "the *cyneceyn*, the noblest among the noble, the house which most truly embodied the whole being of the race." This fancy seems chiefly to arise from an etymology to which Mr. Freeman clings strongly, that of *cyning* from *cyn*; and no doubt it is "hard for an Englishman, looking only to his own language, to avoid the obvious derivation." But it has been rejected, not only by Max Müller, but also by the more formidable authority of Grimm, who points out, amongst other good reasons, that it is impossible to derive from *Kyn* the equivalent Norse form *Konungr*. It is to be feared, therefore, that the ancestors of Camillus and Brennus marched under the command of simple chiefs, and were in that respect no better than any ordinary band of savages.

It is needless to follow Mr. Freeman through his treatment of the Assembly, which relates almost wholly to matters of relatively modern date and historical notoriety; but his last chapter, which he rightly calls desultory, must be noted as disappointing. It contains, amongst other matters, something on the interesting subject of the early existence of a noble class. When Mr. Freeman speaks of eorls and ceorls, he ought to be on his own ground; and when he preludes by saying that although we cannot dogmatically assert, we may conjecture or even infer, with a high degree of probability, our expectations are raised very high indeed. But only to be disappointed, as Mr. Freeman dismisses eorl and ceorl by saying practically that he can make nothing of them, and plunges instead into a discussion of the origin and influence of the familiar Eupatrids and Patricians.

The results of the whole investigation can scarcely be called satisfactory. The number of institutions for which a common origin is claimed is small, and, what is worse, the proof on which it rests is often very slender. What is the evidence, for example, that the Teutonic mark, hundred, and *Gau*, and the Roman *gens*, *curia*, and tribe, are descended from the same primitive political arrangement? The names are not the same; they are not derived from the same roots; they do not even translate each other, nor are we told distinctly what are the supposed marks of

resemblance between each member of the series. One can guess faintly on what sort of proof the analogy between the *gens* and mark is asserted, but it is impossible to say for what reason Mr. Freeman has identified the tribe with the *Gau* or shire, more especially as he has never taken the trouble to tell us what the *Gau* really is. Even in dealing with the more striking resemblances presented by the primitive elements of the Greek and Italian (or rather Roman) state, Mr. Freeman is equally unsatisfactory. It would be difficult to find a better example of confused statement than the few pages which are devoted to this part of the subject; and as if there were not a sufficient number of legitimate sources of difficulty, the whole exposition (if it may be called so) of the earlier organisation is so mixed up with references to the historical changes that it is often a matter of great difficulty to know what the writer is thinking about. Take such a passage as this. Mr. Freeman is maintaining that Rome, in contrast apparently to Athens, was made up of tribes which were essentially local. After telling us that "the settlement of Romulus and the settlement of Tatius—that is, the tribes of the Ramnes and Titienses—occupied two distinct hills among the famous seven," he proceeds thus:

"It is more certain that the new Roman people, the Plebs, was made up from the beginning of strictly local tribes: it is certain that as the state grew it grew by the addition of fresh local tribes. When a new town or district was enfranchised, its territory formed a new tribe; and of the thirty-five tribes of the later commonwealth, the local city of Rome contained four only. And the local tribe, too, like the Attic *ἐῖρη*, was often closely connected with the clan. And though the *ἐῖρη*, as an element of the state, was essentially a local division; yet as the *ἐῖρη* were in their origin *gentes*, or village communities, it was quite possible that at the time the *ἐῖρη* were mapped out the *ἐῖρη* might nearly answer to some *gens* and its following. And in the like sort, though the *ἐῖρη* and the new tribes were local in their origin, yet, when once established, they became genealogical. So it was with the local Roman tribes also."

No doubt this passage represents a complete understanding on the part of Mr. Freeman of the facts of which he is speaking. But the ordinary reader will most likely infer from it, among other conclusions, that the Attic deme was analogous to the Roman local tribe, and that both were in some way founded upon *gentes*.

One very important point in determining the value of evidence is excluded by the mere plan of the work. The only proof that is really advanced of a common descent of political institutions is that of similarity. But if we are to be content with the degree of resemblance which satisfies Mr. Freeman, it would be easy to extend it over the whole world. Tribes and village communities, kings and assemblies, and indeed every institution with which Mr. Freeman deals, may be found in any quarter of the globe. Perhaps in that case we might be entitled to say that all these institutions—or their rudiments, as Mr. Freeman sometimes cautiously observes—existed before the dispersion of mankind, and that the *Gau* and the mark and so on could have been traced in germ upon whatever may be the

scientific equivalent of the Biblical plain of Shinar. But the alternative conclusion is much more obvious: that institutions which are to be found in one form or other in every race of mankind, have most likely arisen from the independent operation of similar causes; and that we are not entitled to ascribe their similarity to common descent, unless the resemblance be of a very specific character. Of course on the other hand we may have a series of analogies so distinct and striking, and so much bound up with other points of resemblance, that we have no choice but to refer them to a common source; but analogies of this kind cannot be established by such vague and loose comparisons as those to which Mr. Freeman confines himself. Nor is the proof made really stronger by the acknowledged kindred of the races. The mere fact that races are akin to each other does not in the least degree help to prove that similarity of institutions infers their common origin, when the same points of similarity can be traced nearly everywhere. Had the points of resemblance been confined to these races, the case might have been different; but there is no reason whatever why similar institutions might not originate independently in kindred races when they have obviously done so in distant stocks. Mr. Freeman might with equal propriety have set himself to compare the institutions of the Teutonic races and those of the Israelites. The same procedure would have led him to conclusions of pretty nearly the same import, and of equal scientific value.

As I have already remarked, a great part of the lectures is devoted to the description and comparison of the later forms of political institutions. Many of these passages, as might be expected, are acute and interesting; but the general effect is confusing. Mr. Freeman's store of historical learning is immense, but, to display it effectively on a field which stretches from the dawn of history to the present day, requires definite purpose and clear arrangement, and these are both absent. Mr. Freeman drifts through his subject, sometimes stern foremost. One never knows when a statement is finished, or whether it may not turn up again in some slightly varied form. At times we have pages devoted to the proof and illustration of some statement that needed only to have been mentioned; and, in compensation, we find points omitted, or passed over lightly, which stood in need of thorough exposition. All this would be of little consequence in the case of an ordinary popular lecturer. But it is a serious matter to find so eminent an historian as Mr. Freeman republishing such lectures as an example of the comparative method. A thorough and careful treatment of a smaller field would have done far more to promote the scientific study of political institutions than any number of eloquent wanderings through history; and the next time Mr. Freeman enters the same field, one is inclined to wish that he may lay a more secure foundation for his wider comparisons by showing us, in the first place, as he no doubt very well can, what really are the institutions common to the whole Teutonic races, before he proceeds to compare them with those of other nations.

ALEXANDER GIBSON.

New Japan, the Land of the Rising Sun; its Annals during the past Twenty Years. By Samuel Mossman. (London: John Murray, 1873.)

MR. MOSSMAN is quite right when he says that the annals of New Japan are unexampled in the history of the world; for never, we conceive, has so vital a change taken place in any country in so short a space of time. Some twenty years ago Japan was almost entirely a *terra incognita* to Europeans, for the Japanese would have nothing to do with them, only tolerating the existence of the small Dutch and Chinese factories at Nagasaki. For more than two centuries the Japanese Government pursued this policy of rigid isolation, not only not admitting foreigners—Asiatic as well as European—into the country, but forbidding its own subjects to leave it. This curious state of things is now changed, and the Japanese have shown themselves eager to adopt our Western civilisation in almost every important particular. They have purchased steamers both for warlike and commercial purposes, and they have had their troops drilled and armed in the foreign manner; they have opened a mint, and established colleges for the instruction of their youth in foreign languages and science; they have introduced the telegraph, and constructed a railway from Yokohama to Yedo, a distance of about eighteen miles. The account which Mr. Mossman gives of the opening of this short line of railway will probably be interesting from the fact of its being the first (and we will hope not the last) in the far East, and we therefore quote from it here:—

"After many difficulties, financial and otherwise, the Government announced that the line would be opened for traffic on June 12, 1872. On the previous evening four members of the Ministry, accompanied by the Minister of Public Works and the Foreign Commissioner of Railways, came down to Yokohama, and made a formal inspection of the line, which they pronounced ready for traffic. Next morning a train was in readiness. . . . The plan on which the carriages were built was similar to those on the German railways, that have a gangway in the middle, with the compartments opening into each other by sliding doors. About a hundred foreigners and natives, including several Japanese officials, entered the train, which started at eight o'clock, awakening up the echoes of the settlement with its shrill steam-whistle. On it rolled, as smoothly as on the best line in Europe, and . . . crossing the bridge over the Logo stream safely, it arrived at Sinagawa, the southern suburb of Yedo, in thirty-three minutes. There was no particular ceremony on the occasion, and yet this was the most significant work of progress that has been done in Japan;—"

especially if we take into consideration that the line of railway runs parallel to the Tokaido, the great highway of Japan, where but a few years since murderous outrages were committed on unoffending foreigners.

The Japanese are further showing a decided tendency to imitate the foreign style of dress, with some variations of their own, and one of the latest innovations was the introduction last year of the European calendar; they have, however, determined to make the accession of the first Mikado the commencement of their era, and the present year is with them the year 2334.

Between these two extremes, which we have briefly indicated, there lies a troublous period of time, full of stirring events, of which Mr. Mossman gives many details, telling us of the various treaties negotiated with foreign powers, and the embassies sent to Europe and America for political and commercial purposes; of the outrages on foreigners and their property, for some of which the Japanese suffered severe punishment; and of the civil war which has raged furiously in the land; and showing how it happened that the Mikado—formerly regarded by foreigners as a sort of high priest—has emerged from his obscurity and taken the reins of power into his own hands. We hope that the new régime will last, and that Japan will go on as she has so well begun; but, though we do not wish to be thought alarmists, we cannot forget the decree which the Mikado, or, at any rate, his ministers acting in his name, issued from Kioto to the Siogoon in 1863—only a little more than ten years ago—commanding the “sure expulsion of the barbarians.” The conversion of the Japanese has been a very sudden one, and we think that foreigners will do well to be careful in their relations with them, and to beware of treachery, for it is always better to err on the side of prudence and caution in dealing with wily Asiatics.

We cannot say very much for the manner in which the writer of this work has executed the task which he has undertaken. Not content with dividing his book into thirty chapters, he has further subdivided it into 550 paragraphs, to each of which he has prefixed in italics what we may term a text. The details into which he enters are frequently tedious, and the narrative disjointed and fragmentary. A book of this nature would have been the better for an index and also for a few lines of introductory matter, if only to show whence the materials have been gathered. Lastly, it is not often that we meet with a work which contains such glaring errors in grammar, &c., more especially when we take into consideration that the author was formerly the editor of a newspaper.

EDW. DUFFIELD JONES.

Wilhelm von Giesebrecht, Geschichte der deutschen Kaiserzeit. Part I. (4th Ed.); Part II. (3rd Ed.); Part III. Part IV., Sect. I. Brunswick: A. Schwetschke.

A SHORT time ago the Philosophical Faculty at the University of Breslau offered a prize on one of its foundations for an essay on the extent to which the historical studies of the last decade had contributed to the accomplishment of German unity. Any one who attempts the solution of this difficult problem will find occasion to study Giesebrecht's *History of the Times of the German Emperors* more closely than almost any other work of recent German historical literature. In the preface to the first edition of his work, in 1855, the learned author referred to the sad state of his country, then split into so many fragments, and to the ardent longing of the people for the restoration of a united, great, and powerful Germany. He at the same time expressed his belief that

historical studies might be of eminent service in bringing about the desired result, and hoped that political union would be made easier by a common general endeavour “to know and understand the inner nature and characteristics of those past times in which that united, great, and powerful Germany had been a reality.” To assist in influencing the picked youth of the nation, and to show them the conditions under which alone it would be possible to pave the way for such a happy future for the whole nation, was the purpose which the author set before him at the commencement of his work. He could not conjecture how promptly what was then only the dream of a few patriotic hearts would become a living reality, and in rewriting the preface to the fourth edition of the first part of his work he confesses to the astonishment with which the wonderful transformation of German history, which he has lived to see, has filled him. But German readers will not forget his share in the work of transformation, or deny the claims of his history to be something more than a mere book, namely, a patriotic act.

But, as a scientific contribution to modern German historical literature, Giesebrecht's work is also entitled to a high place. It has often been complained that in spite of the number of students engaged in investigating the history of mediæval Germany, there is no one work summing up in a general picture the results of all the special researches relating to that important period. Leibnitz's *Annals* and Marcov's *Commentaries* have remained unfinished. Hahn's *Einleitung zu der deutschen Staats-, Reichs- und Kaiserhistorie* (published in 1721), and Schmidt's *Geschichte der Deutschen* (1778), however meritorious they may have been, considering their date, are far from satisfying the more exacting demands of the historical criticism of the present day. Luden's twelve volumes of the *Geschichte des deutschen Volkes* only reach down to 1237, and its defects—the weakness of the evidence, the rashness of the hypotheses, for which there is frequently no solid foundation at all, and the bombastic style of the phraseology—are all of a nature to become increasingly apparent with the lapse of time. Lastly, both Stenzel's *Geschichte der frankischen Kaiser* and Raumer's *Geschichte der Hohenstaufen*, though works of the highest merit, only embrace a small portion of the whole history of the mediæval Empire; so that there are really only two modern works with which Giesebrecht's book can be compared: Souchay's *History of the German Monarchy* (Frankfort, 1861–2), and Sugenheim's *History of the German People and Civilization* (Leipzig, 1866–7).

There can be no doubt that Giesebrecht's work is far superior to the other two, not only in thoroughness and solidity of research, but also in the attractive way in which the results of the research are put forward.

It was his principle never to rest satisfied with merely offering a critical selection from amongst the conclusions of existing monographs relating to special points in the history of the Emperors and the Empire, such as have become so numerous during the last few years. In every case he has himself repaired to the original sources

of our historical knowledge, and not content with the single passage that, perhaps, alone bore directly upon his theme, always proceeded to a thorough investigation of the document in which it was to be found, in order to estimate its general credibility and the historical value of the single notice depending on its authority. How much diligence and critical acumen he expended in this way is amply shown by the *Uebersicht der Quellen und Hilfsmittel*, which accompanies every section, and in the separate volumes is appended to the narrative as it proceeds. No higher praise can be given to this part of his work, than to say that it retains an independent value of its own even after the publication of Wattenbach's well-known book, *Deutschlands Geschichtsquellen im Mittelalter* and in comparison with it. No one can do full justice to Giesebrecht's contributions to a correct knowledge of the period, who has not had practical experience of the difficulty of the task of reconstructing the true connection of social facts out of the scattered and often imperfect materials upon which we have to rely for the centuries of the middle ages in Germany. It is an undeniable fact that, so far as it goes, Giesebrecht's work offers a firm foundation for future studies of the history of the German Emperors, which is made proportionately easier in consequence; but at the same time it must be allowed that, like every other human production, the book is not free from faults, mistakes, and oversights, while here and there an opinion or a point of view may seem to call for verification or correction. It would be strange if this were otherwise, and we cannot commend the proceedings of younger historians who make a merit of insisting upon a few of these natural and unavoidable errors, which are after all less numerous than might have been expected, so as to detract, intentionally or otherwise, from the credit due to the author's real merits. Competent judges will be the last to deny that—however opinions may vary upon points of detail—taking the work as a whole, it represents the view of the subject which is almost universal at the present day, and does not appear likely in the future to undergo very material modification.

In the matter of literary form, Giesebrecht's excellence has long been recognised as it deserves; his book has made its way beyond the narrow circle of special students, and has conquered readers for itself throughout the general educated public of Germany. The best proof of this is to be found in the demand for a fourth edition, which, considering the unfortunate circumstances of the book-trade in Germany, constitutes a success almost unparalleled for an historical work of a serious kind—except, of course, by the writings of the old master, Ranke. The warm and lively descriptions, every sentence of which shows how completely the author has mastered his subject, the acuteness with which the characters of the leading personages are sketched, and the clearness and transparency of the style, are among the chief recommendations of the book. To this must be added, in the interests of the reader who is not a professed historian, that the results of the author's work can be

easily surveyed without the labour of following his learned investigations in detail, as the notes, excursus, and quotations are not printed at the foot of the text, but are relegated to the end of the whole work. If the book leaves anything further to be desired, it is that in addition to the political history the author should have accorded rather more space to the history of the laws, the constitution, and the civilisation of Germany, than has been hitherto done. This would have been particularly valuable during the Hohenstaufen period.

It is evident that a work like the present does not lend itself to abridgment, or to the extraction of separate portions for notice by themselves, so that I shall not attempt to do more than mention the contents of each volume. Vol. I. begins with the primitive Germanic times, and after a short survey of the Frankish empire, proceeds to give the lives of the five first German kings—Konrad I., Henry I., and the three Ottos. Vol. II. deals with the reigns of Henry II., Konrad II., and Henry III. Vol. III., the most extensive, as well as the most important of all, treats of the great conflict between Church and State under Henry IV. and Henry V.; and the first section, which is all that has as yet appeared of the fourth volume, contains the reign of Lothaire and the first years of the reign of Konrad III.

The foreigner seeking information with respect to this period of German history can choose no better book than Grisebrecht's for his guide; and we believe that a translation of it, in which the critical apparatus of notes and authorities might be omitted, would be interesting to a large circle of the educated reading public in England. The occurrences of the last few years have been calculated to bring into relief the solidarity of interests amongst all German nations; and nothing can contribute more to the belief in this solidarity than for each nation to make itself familiar with the peculiar historical development through which its fellows have passed. Many misunderstandings would vanish, and the bond that unites one people to another would be strengthened if such a result could be effected.

HARRY BRESSLAU.

Histoire du Romantisme. Par Théophile Gautier. (Paris: Charpentier, 1874.)

THE *Histoire du Romantisme* is the first volume of a series in which it is intended to collect and republish the scattered *feuilletons* of M. Théophile Gautier. These short papers, written for the amusement of the day, have all the permanence that consummate style and unwearied and exquisite fancy can give. Unluckily the criticisms are generally more valuable than the works with which they deal—the plays and novels and verses of the moment. But the *Histoire du Romantisme* possesses a certain unity and continuity, as a series of sketches of a curious subject. And it is more as a collection of curiosities than as an episode in grave literary history that M. Gautier treats his theme. This is because the words Romantic Art, in the sense of “the most novel treatment of the beautiful,” have ceased to be applicable to the great writers who were the

first fruits of the Romantic movement, and whose writings and thought have become part of the main stream of literature. Mere strangeness and novelty are no longer the note of the work of Victor Hugo, of George Sand, of Balzac. They are occupied too much with the eternal emotions of human nature, with the situations and affections which are not new, but which never grow old. Their names are graven on the rock, and their poetry has passed into the possessions of the race, while the title and fleeting fascination of romance is left to the poets whose names are written in water, and whose verses are a delicate form of literary *bric-à-brac*. Thus, M. Gautier has but little to tell of the Master, of Victor Hugo, though it will probably be a surprise to most English readers to learn that “if M. Hugo were not a poet he would be a painter of the first rank. . . . Many artists might envy him the strange faculty of creating donjons and old streets, castles and ruined churches, in an unwonted style, of an unknown architecture, full of suggestions of love and mystery, and the confusion of a nightmare.”

It is not about M. Hugo, but about his circle, the young enthusiasts who made his court, that M. Gautier prefers to gossip. Such a man was Pétus Borel, the author of *Madame Potiphar*. The speciality of this sombre genius was Lycanthropy, a field in which, as he rightly guessed, he was likely to meet few rivals or imitators. Others were Philothée O'Neddy, whose volume of verse bore the modest title of *Feu et Flamme*, and Augustus MacKeat, who flattered himself that his pseudonym showed his respect at once for the land of Scott and the genius of the author of *Endymion*. M. Gautier writes with great humour and enjoyment about these phenomena in the morning sky of Romanticism. These were the times of Merovingian length of hair, of bandit hats, of blazing red waistcoats, of banquets where a skull was used for a cup, in boyish imitation of Byron's youthful orgies. The partisans of Hugo, a volunteer *claque*, would wait all day in the theatre for the curtain to rise on *Hernani*. Classicists and Romanticists came to blows in the pit, duels were fought about the caesura, M. Dumas' green coat was torn off his shoulders by fanatics eager for relics, M. Hugo's staircase was haunted by young poets anxious *Virgilium videre*. The rage of revolution was the fiercer as the previous oppression of pseudo-classicism had been more dull and leaden. Who knows now how insipid were the poems of the Empire and the Restoration, how colourless and tame the design, from what a Homeric Hades of dreary art, the youthful poets and painters were eager to escape? “Pour nous,” says M. Gautier,

“le monde se divisait en *flamboyants* et en *grisâtres*, les uns objets de notre amour, les autres de notre aversion. Nous voulions la vie, la lumière, le mouvement, l'audace de pensée et d'exécution, le retour aux belles époques de la Renaissance et à la vraie antiquité, et nous rejetions le coloris effacé, le dessin maigre et sec, les compositions pareilles à des groupements de mannequins que l'Empire avait légués à la Restauration.”

This enthusiasm was the best side of the movement, though the cry of *l'audace, et toujours de l'audace* is more useful in political

than in literary revolutions. But along with boyish enthusiasm there was a good deal of self-consciousness, and even of childish conceit. Young artists posed as brigands and troubadours, just as young Jacobins posed as Brutus or Aristogiton. We hear too much of dress, of *coiffure*, and are reminded of M. Asselineau's *Life of Baudelaire*, where four portraits represent the poet with his hair and beard arranged in four different ways. This self-consciousness was the misfortune of the romantic movement in France. In England, Wordsworth and Shelley and Scott were at work in the direction of more colour, more passion, more freedom, wider humanity, before they were well aware of what they were doing, or knew what spirit they were of. But France took up the new ideas and the new impulse consciously, and borrowed them full grown from Goethe and Scott; men studied their *rôles* in Byron, and were original of malice prepense. And this self-consciousness led them always to strive to outdo each other in strangeness of subject and sentiment, in remoteness from common humanity, till of all the gifts of the school, only their perfect workmanship is left.

The theatrical character of the minor Romanticists prepares us for finding them wearying of their *métier*, giving up their “exaggerated troubadourism,” the poets becoming journalists, the painters designers on wood or for lithographs, the more irreconcilable spirits ending as *sous-préfets*. M. Gautier's reminiscences are more interesting when he has to speak of true artists and men of real genius, however erratic and unfortunate. There is a very touching picture of Gérard de Nerval, with his habit of taking long lonely walks, and of running at full speed, as he became excited by his thoughts, a trait which Shelley's schoolfellows at Eton used to remark, but which must have excited less notice in the Long Walk, or in the playing fields, than in the streets of Paris. If any touch were wanting to make the scene of De Nerval's suicide—the grey winter morning, the sickly light between the black pointed roofs, the soiled and trodden snow—more weird and bleak, it would be the incident of the raven fluttering and croaking in the lane where the poet died by his own hand. Another artist little known in England, though once the hope of the romantic school of painting, was Célestin Nanteuil, *le jeune homme moyen-âge*.

“Il avait l'air d'un de ces longues anges thuriféraires ou joueurs de sambucque qui habitent les pignons des cathédrales, et qui serait descendu par la ville au milieu des bourgeois affairés, tout en gardant son nimbe plaqué derrière la tête, en guise de chapeau, mais sans avoir le moindre soupçon qu'il n'est pas naturel de porter son auréole dans la rue.”

Nanteuil was the designer of a wonderfully beautiful sketch of M. Gautier as a young man, with heavy locks and melancholy eyes, weary as it might seem of search, and content to rest in the enjoyment of the present.

The natural and usual end befell all the enthusiasm and all the enthusiasts. *Hernani* was played without causing the faintest excitement, *Antony* was put on the stage, and M. Dumas' coat, no longer a green coat, was

safe on his portly shoulders. M. Gautier himself, instead of arming himself with a club, and draping his frame in a *gilet rouge*, wrote dramatic criticisms for the *Moniteur*. And then it came about that the Minister of Public Instruction requested M. Gautier to draw up a report on the state of French poetry, to accompany the other reports on commodities at the Exhibition of 1867. So brilliant an essay never had so commonplace an occasion. The criticism is so light, so facile and friendly, so lenient and conciliatory, that one almost forgets the sadness and the failure of the whole affair. Here is the sworn foe of the grocer and the Philistine enlightening the Philistine and the grocer on the progress which poetry, like other mechanic arts, has made between 1848 and 1867. He has to tell of the deceitfulness of promise, the extinction of enthusiasm, the decadence of romance. It is not that there are no more poets in France. Their name is Legion; never were there more young gentlemen born out of their due time, and anxious to return to the life of Greece with Leconte de Lisle, or, like Charles Baudelaire, to find beauty in recondite wickedness. The aesthetic side of Christianity has been exhausted, as well as the artistic interest of the post-diluvian world. M. Bouilhet takes refuge in describing the loves and battles of Pterodactyls, "by the shore of the boiling sea, in an atmosphere charged with carbonic acid gas;" and M. Catulle Mendes finds a rest for his wearied soul on the well-known Elephant which is supported by the notorious Tortoise of Hindoo cosmogony. But M. Gautier owns that this strange mythology is hard to acclimatize in France. Thus there is abundance of accomplishment, plenty of science, and sentiment. But, "sad to say, one may publish two or three volumes of verse full of merit, and remain perfectly unknown." Every man is his own poet, and the public is deaf to the voice of all these charmers.

This state of things M. Gautier describes with the lightest touch and the least perceptible smile. His method of criticism is not too thorough or searching. Inspired perhaps by the collection of so many pleasing examples of the arts, he is anxious to add to the store of pretty things, and compares the poetry he reviews to cups, to broderies, to paintings, and cameos. Which of M. Soulayr's sonnets could equal this praise of them in elegance?—

"Nous préférons à des bibliothèques de gros volumes d'un intérêt mélodramatique, cette fine étagère finement sculptée qui soutient des statuettes d'argent ou d'or d'un goût exquis, et d'une élégance parfaite dans leur dimension restreinte, des buires d'agate ou d'onyx, des cassolettes d'émail contenant des parfums concentrés, de précieux vases myrrhins opalisés de tous les reflets de l'iris, et parfois un de ces charmants petits vases lacrymatoires d'argile antique contenant une larme durcie en perle pour qu'elle ne s'évapore pas."

What conclusion is to be drawn from this long review of the poetry of a generation? Is this science of versification to be wasted? is no one to find matter to put in the pretty phrases, no one to have something to say, as well as to be able to say everything? Here criticism is of no avail; she can only prophesy and be wise after the event. M. Taine

can always tell what forces produced a poet, but even he cannot predict what social tendencies and what events will produce another. And humanity in France has something else to do, as M. Gautier allows, than to listen to singing birds and to smell the perfume of violets. A. LANG.

When you See me, you Know me. By Samuel Rowley. (London: Williams & Norgate.)

WE have just received the proofs of this play, edited, with a careful preface, by Dr. Karl Elze. *When you See me, you Know me* is one of those interminable chronicle-histories, dramatised, but not divided into acts, which make up a large portion of our earlier theatrical literature. Its chief value consists in its relation to minute Shaksperian criticism. First published in 1605, but probably well known before that date upon the stage, it may have received Shakspeare's notice prior to the composition of *Henry VIII.* The two plays are concerned with nearly the same series of events in the life of Henry; and if *When you See me, you Know me* deserves a permanent place among the reprints of Elizabethan writings for the theatre, it is only as an additional proof that Shakspeare turned by a touch the dullest dross to gold. Dr. Elze inclines to the opinion that Rowley's chronicle-play preceded Shakspeare's; but he also calls attention (at p. xii. of the preface) to certain coincidences between passages in this work and in *The Taming of the Shrew* and *The Merchant of Venice*. Whether these coincidences point again to Shakspeare's alchemy, or rather prove that a feeble echo of the master's melody rang in the ears of an imitator, must depend entirely upon the date which we assign to the Shaksperian comedies in question. As a favourable specimen of Rowley's style, I will transcribe a portion of the speech of Dr. Tye (some of whose church music, by the way, still holds its own in our cathedral anthem books) on Music. It will be seen that there is a similarity between it and the celebrated lines spoken by Lorenzo in the garden of Belmont:—

"Music is heavenly, for in heaven is music.
For there the Seraphins do sing continually.
And when the best was born, that eer was man,
A quire of angels sang for joy of it;
And if the poet fail us not, my lord,
The dulcet tongue of music made the stones
To move, irrational beasts and birds to dance;
And last the trumpet's music shall awake the dead,
And clothe their naked bones in coats of flesh,
To appear in that high house of Parliament."

For my part, I am inclined to think that, if the coincidence is not wholly accidental, we may have in these lines the first rough draft of that which afterwards appears in perfect form in *The Merchant of Venice*. In poetry a movement from the rude and simple to the highly wrought and complex is far more intelligible than a degeneration from exquisite art to naive untutored nature.

The title *When you See me, you Know me* has no obvious propriety. It seems to have been made to match that of Heywood's *If you Know not me, you Know nobody*, a chronicle-play of Elizabeth's reign, which appeared in the same year. These two histories must have been published by Nathaniel Rutter to be sold in pairs, for they were severally adorned with portraits of King Henry VIII. and his daughter. Intrinsically, the play has but little merit. The best scenes are comic: especially the episode of Henry's encounter with the thief, Black Will, and his incarceration in the Counter. The English public loved to see their princes brought upon the stage in some mad freak that put them on a level with their subjects. This gave piquancy to Heywood's *Edward IV.*, and to the anonymous *George a Greene, the Pinner of Wakefield*. How Shakspeare embellished the motive in *Henry IV.*, the whole world knows; we owe Falstaff and his friends to this peculiarity of the

popular taste. For the rest, much cannot be said in favour of the play on the score either of character-delineation or of dramatic expression. There are some quaint fool-dialogues, and one scene in which "young Edward Browne," Prince Edward's "whipping-boy," is birched in lieu of his royal playfellow, has the merit of novelty.

About the life of Samuel Rowley nothing is known. Six of his plays in MS. are catalogued by Halliwell. With the exception of *When you See me, you Know me*, only one, *The Noble Soldier*, exists in print. To Dr. Elze thanks are due for having added to our Shaksperian library a play which cannot fail to interest all students of the Elizabethan drama as a whole. His critical introduction is exhaustive. J. A. SYMONDS.

MINOR LITERATURE.

Axel and Valborg. A Tragedy in five acts, and other poems. Translated from the Danish of Adam Oehlenschläger by Pierce Butler, M.A. Edited by Professor Palmer. With a Memoir of the Translator. (Trübner & Co.)

Axel and Valborg. A Tragedy, from the Danish of Oehlenschläger. Translated by H. W. Freeland. (Reeves & Turner.)

It is an odd coincidence that two translations of a Danish drama, published more than sixty years ago, and never before rendered into English, should appear within a fortnight of one another, but it seems that Mr. Freeland was induced to hurry his MS. to press by seeing Mr. Butler's translation announced. What makes the coincidence less a matter for congratulation is that the drama selected is very far from being the best or most characteristic of the works of Oehlenschläger. It has been called the *Romeo and Juliet* of the North, principally because Oehlenschläger, who in most of his dramas was so severe, admitting, for instance, into *Paluatoke* no female character whatever, dedicated the whole of *Axel og Valborg* to sentimental love. The play has remained one of the favourite stock-pieces of the Copenhagen stage; but, setting aside its obvious merits as an acting play, it hardly seems to merit its extreme popularity. It was produced when Oehlenschläger was just taking the Danish public by storm. The terrible critic of the *Flyvende Post*, J. L. Heiberg, found little evil to say of it, and it slipped into success when the far nobler dramas of *Hakon Jarl* and *Paluatoke* had been hissed and hooted. It was written at Paris in 1808. Of the two versions before us that of Mr. Butler, which we regret to see announces the translator's death, seems to be the more scholarly and graceful, but both are good. Mr. Freeland, who was a friend of Hauch, and has translated one of the minor works of Frederick Paludan-Müller, is an accomplished student of Danish literature. He precedes his version of *Axel og Valborg* by a rendering of Hauch's noble ode to Oehlenschläger, which he translates in a particularly spirited manner.

The Magician; a Drama in Five Acts. A.D. 1470. (John Pearson, York Street, Covent Garden.) Given a villain with two elder brothers, one just dead, the other imprisoned for magic. Let the villain desire to keep the magician out of his inheritance and the magician's son out of his lady-love, and let the villain be confounded by the vicissitudes of the Wars of the Roses after five acts of blank verse and bustle, and we shall have a play quite good enough to take rank with the thinnest productions of the Elizabethan age—let us say, the *History of Sir John Oldcastle, Lord Cobham*. The writer has got to discourse quite vigorously and naturally in the artificial dialect that results from a corrupt following of Shakspeare, where metaphors tread upon each other's heels and trip each other up, and the business never halts for the fine writing, so that one can fancy the thing would be better to hear than to read. Though there is nothing in it but blank verse and

bustle, both are good enough of their kind to warrant the author in confidently affirming "that systematic indifference to every attempt like the present must surely hold a conspicuous place among the causes which tend to retard the rehabilitation of the British Drama." A dispassionate reader might read for "causes" "symptoms" which show that the rehabilitation of the British Drama is unlikely.

Donington Castle: a Royalist Story. By Colonel Colomb. (London: Longmans.) Here is a stanza:—

"By St. George!" Boys muttered then,
"Could my hand yon villain reach,
I would lesson to him teach
He should ne'er forget again;
Sadder sight I ne'er shall know,
'Tis enough to mar one's sleeping—
Little palfrey wounded so,
Little maiden on him weeping!
But although the fact be plain,
The conclusion may be vain—
How could he have meant to shoot
Dumb and inoffensive brute?
Or at maid direct a ball?
No, 'twas accidental all."

READERS of Major-General Sir Vincent Eyre's *Lays of a Knight-Errent in Many Lands* (London: H. S. King & Co.) will not fail to envy the buoyant spirits which do not seem to have deserted the veteran author under the more trying circumstances; for though his verses do not carry us quite back to the Kyber Pass, our sympathies are enlisted on behalf of the beautiful and interesting dog "Dandy," and the terrible period of suspense preceding the relief of Lucknow by Sir Colin Campbell. It is no small praise to be able to add, that in spite of the playful tone adopted by our "Knight-Errent" there is not a touch of flippancy in the book which could jar on the most sensitive. On the contrary, while the more serious pieces, such as "On the Death of a New-born Infant" and the sonnet in memory of the Countess Canning, treat of their subjects in a tone suitable to their solemnity, in the very lightest "Lays" there is a deep "reverence for all things good."

To the reading public generally *vers de société* are essentially acceptable, and in their estimation the fact that the "Lays of a Knight-Errent" are not intended to unfit them for appreciating either Clough or Praed need not be a blemish or a drawback.

Home Songs for Quiet Hours. By the Rev. R. H. Baynes. (H. S. King & Co.) Mr. Baynes's previous sacred anthologies have obtained a popularity above discussion; they belong to the class of books that choose their readers, and apparently find many worthy to be chosen. "Home Songs" is up to Mr. Baynes's usual level. We notice that Mr. Ford contributes largely.

Songs for Music. By Four Friends. (H. S. King & Co.) The four friends are Juliana H. Ewing, Reginald A. Gatty, Stephen H. Gatty, and Greville I. Chester. The words seem rather thin and poor, though not without grace and refinement; the metres we should have thought hardly flowing enough to go well to music.

Lyra Christi. By Charles Laurence Ford, B. A. (Houlston & Co.) The writer's fancy flows freely and smoothly, and is fed by a vein of cheerful, soberly ingenious piety, too practical to be shallow, and not too profound to be popular. Our readers may recommend the volume very confidently and respectfully to all young ladies interested in curates. There are stanzas in "Christ's Service," and "The Garden" quite worthy of George Herbert, though the reader will be reminded oftener of Miss Procter and Mrs. Alexander.

Jephthah's Daughter. By R. Lowth. (Hardwicke.) A drama which turns on the place of human sacrifice in ancient Hebrew worship; the language is spirited, the versification tame.

The Chained Bible, by the author of "Kimbolton Castle," is published by the Christian Book Society. Their subscribers will think it does them credit.

The Exiles at St. Germain's. By the Author of the *Lady Shakerley*. (Hurst & Blackett.) Babies are interesting, and royal babies especially interesting; and the author of *Lady Shakerley* knows how to present this interest in the most refined shape. An old lady tells the story of her girlhood to her grandchildren, including the recollections and diary of her great grandmother, who was nurse to Mary of Modena's daughter, and thought Prince Charlie a type of Christ. The diary introduces a great many anecdotes of the Royal fugitives, a great many Jacobite songs, and two poems by Ossian, who, we learn, was the favourite poet of Claverhouse. The prose of the book, which is better than the verse, is not without an aftertaste of the sweetness of the "White Doe of Rylstone," and the "Grandmother's Apology," but it is right to warn the reader that it is used to flavour pap.

MR. A. TOWGOOD has sent us *A Shadow of the Orestes*, in a Series of Dramatic Sonnets (Rivingtons), which are quite good enough to justify the notion that he has been as well employed as a music master who extracts a series of waltzes from an opera; only one can dance to waltzes.

Persis; a Narrative of the Seventeenth Century. By the Rev. C. B. Tayler. (Sampson Low & Co.) Mr. Tayler has sought to interest us in the hard usage the Presbyterians experienced under Charles II. by some barley-sugar idylls about a daughter of a pious Presbyterian, with a pious Episcopalian brother, who marries the son of a Liberal baronet. The narrative is not very unfair, except that the author omits all mention of the stupid pedantry by which the Presbyterians lost their chance of a compromise.

Elsie Dismore, Holidays at Roselands, and *Elsie's Girlhood*, by Martha Farquharson (King & Co.), are three neat little volumes of American extraction, that will be admitted into no well-ordered nursery or schoolroom. Little girls of ten who wear diamond rings, and are persecuted by fond papas into brain fever because they have conscientious objections to reading moral fictions on the Sabbath day, and talk about their souls to the young gentlemen they are ultimately to marry, happily do not exist in this country, and we do not wish to import them.

EDITOR.

NOTES AND NEWS.

MR. RUSKIN'S *Elements of Drawing*, has been out of print for some time, and the author, instead of re-issuing it in its present shape, has commissioned Mr. St. John Tyrwhitt to embody in a narrative of the fortunes personal and artistic of a sketching-club, "the whole or any part of his practical treatise on landscape, called the *Elements of Drawing*" with the woodcuts. The volume will be published very shortly with the title *Our Sketching Club*.

MESSRS. F. WARNE & Co. are about to issue a comprehensive work on the subject of the English peasantry from the pen of Mr. Francis George Heath, author of the *Romance of Peasant Life*.

MR. HENRY HUTH has just printed privately 50 copies of an extremely quaint and curious selection of "Prefaces, Dedications, Epistles, selected from early English Books 1540-1701," taken mainly from his own magnificent library at Princes Gate, but with a few added from Mr. T. Christie-Miller's collection at Britwell, &c. The selection has been very judiciously made by Mr. W. C. Hazlitt, under Mr. Huth's direction, and comprises many most rare and interesting pieces. Braham's abuse in 1555 of "Wylliam Caxton," "for his leawde recneil of Troye . . . a longe tedious and brayneles bablyng . . . procedaynge therein as an ydyot in his follye" will shock our black-letter men, while his praise "of the great Chaucer, y'

onely glorie and beauty of our tunge," and of the poet's first editor "one willyam Thinne . . . who [was] laudably studyouse to y^e polyshing of so great a jewell," will please Chaucerians now. Prynne's groans in 1633 over the shocking fact that "Shackspecers Plaies are printed in the best Crowne paper, far better than most Bibles," should warn the New Shakspeare Society not to indulge in "handsome quartos." Mr. Grymeston's advice in 1604 as to marriage should be taken by bachelors now:—

"Defer not thy marriage till thou comest to be saluted with a *God speed you, Sir*, as a man going out of the world after forty; neither yet to the time of *God keepe you, Sir*, whilst thou art in thy best strength after thirty; but marry in the time of *You are welcome, Sir*, when thou art coming into the world; for seldom shalt thou see a woman out of her own loue to pul a rose that is ful blown, deeming them alwayes sweetest at the first opening of the bud."

Palsgrave's account of education in England in 1540, Greene's in 1589, Hart's of our orthography in 1569, Barnabe Rich's "New Description of Ireland" in 1610, &c. &c., are full of information and interest. Open the book where you will, it gives you pleasure. We only wish Mr. Huth had printed 500 copies instead of 50.

JUDGMENT has been given by the Court of Civil Jurisdiction, at Toulon, in the case of the representatives of Michelet, in which the question of the final disposal of the body of the lately deceased writer had been made a subject of dispute between his widow on the one hand, and the daughters and sons-in-law of his first wife on the other. The presiding judge decided against the children, that the remains should not be carried to Paris but be left undisturbed in the cemetery at Hyères. M. Poullain-Dumesnil, the son-in-law of Michelet, has announced through the public papers that, although he had considered Paris to be the most fitting spot in which to deposit the remains of so distinguished a French author, he feels bound—in consideration of the testamentary clause by which Michelet had directed that he should be buried in the nearest burying ground—to set aside his own wishes on the subject, and to submit without dissent to the decision of the law courts. Thus we may hope that this unseemly strife over poor Michelet's remains is at an end.

AMONG the donations to the Bodleian Library in 1873 were these from Mrs. Grote:—

"The original MS. copy of Mr. George Grote's work upon Aristotle, as it was returned to the Author by the Printer. Folio.

Aristoteles: Græce, ex recensione Immanuelis Bekkeri—editit Academia Regis Borussiae; 5 vols. 4to, Berolini, 1831-1870. [This copy was the one used by Mr. Grote, and is illustrated with marginal notes in his handwriting.]

Platonis Scripta Græce Omnia; recensuit Immanuel Bekker; vol. ix. 8vo. London, 1826. [This copy was the one chiefly used by Mr. Grote, and is illustrated throughout with marginal notes by his own hand.]

A few pages of MS. notes from his History of Greece, and elsewhere, in the handwriting of Mr. George Grote.

The Vocabulary of Philosophy. Mental, Moral, and Metaphysical. By William Fleming, D.D., with a few MS. notes by Mr. George Grote. 8vo, London, 1857."

THE new librarian of the Berlin library will be Professor Lepsius. Dr. Pertz, who has been at the head of the Royal Library for many years, and has brought it to the highest state of efficiency which was possible within the ancient walls, will resign. It is hoped that Parliament will immediately grant the sums necessary for a new building and a more powerful staff.

THE *Nation* of the 26th ultimo has an interesting note on the March number of *Lippincott's Magazine*, which has not yet arrived in England. It contains an article on Laval, Cannes and the country round about, and the Isle of Sainte-Marguerite, with a sketch of Rachel in her last days.

The writer incidentally corrects an error embodied in Matthew Arnold's sonnet on Rachel, which makes it a happy thing for the dying actress that she drew her last breath at Cannes, where—as was well—

"The fret and misery of our northern towns
In this her life's last days, our poor, our pain,
Our jangle of false wits, our climate's frowns,
Do for this radiant Greek-souled artist cease;
Sole object of her dying eyes remain
The beauty and the glorious art of Greece."

This refers to the fact that the room in which Rachel died contained a statue of Polyhymnia, wrought by David (of Angers), an intimate friend of M. Sardou, who was owner of the villa occupied by the actress. But in reality, the sick woman, on first being shown to her room, fainted away at the sight of this figure, and could not sleep till it was removed. It was terrifying to her as having once been seen by her in a dream, and seen in a threatening attitude. The fact that Rachel was often an extremely imaginative person in her statements has made some people doubt the reality of the alleged vision; but the discovery of an entry in a note-book of a long previous date is held to be proof that it was really seen as alleged.

GUSTAVE FLAUBERT, the author of *Madame Bovary*, is one of the few French novelists whose talent has been helped by patience, who has consistently refrained from flimsy series à la *Montépin*, and evanescent *feuilletons* in the manner of Xavier Aubryet. He has been silent for five years, and the repose was well earned by such works as *Salammbo* and *L'Education Sentimentale*. The result of his retirement is *Le Candidat*, the author's first dramatic effort, and *La Tentation de Saint Antoine, a mystère*, which will be published by M. Charpentier on April 1. M. Flaubert conceived the idea of this new work at the fair of St. Romain at Rouen.

"It was there," writes the author, "in that canvas booth of the Boulevard Beauvoisin, that I thought of portraying a veritable St. Anthony, a living, animated personage, surrounded by the men of his time. My *Tentation de Saint Antoine* is an heroic, philosophic, and archaeological reconstruction of the fourth century, of the circle in which the saint lived, of the carnal and other temptations to which the poor cenobite was subjected. The form I have chosen is a sort of *mystère*, a primitive piece in three periods, and filling one volume, something in the style of Quinet's *Ahasuerus*, wherein the scenery will be described with the carefulness that always guides me in such researches."

Moreover, we are assured that the realistic descriptions that shocked certain readers of *Madame de Bovary* and *Salammbo* will not form the attractive features of the forthcoming work.

At Newcastle-upon-Tyne, on the 20th ult., died Mr. Robert White, whose name was well known in connection with the literature and antiquarian history of Northumberland and the Scottish border. Born in a comparatively humble position, but endowed to a remarkable degree with the persevering industry and unquenchable thirst for knowledge so often found among the Scottish peasantry, he succeeded, while cultivating an ardent taste for literature, in also attaining to a position in life which left him, long before old age, free to gratify to the full his literary and antiquarian tastes. He was one of the most famous book collectors of the North of England, and leaves a library of great value, which is said to contain "the most exhaustive collection of the floating literature of Newcastle and Northumberland during the last and present generations that is anywhere to be found. He was also an inveterate collector of chap-books, old tracts and folklore of every description, and his literary accumulations in this department would form a valuable addition to any local museum." Mr. White early exercised his pen in verse composition, chiefly of the ballad kind, and in 1867 published a volume of his collected poems, containing some pieces of

considerable merit. His name was first generally known perhaps by his edition of the life and poems of the orientalist John Leyden, the contemporary and friend of Scott. At a later date he devoted himself to the elucidation of some of the historical conflicts on the border, and his "Battle of Otterburn," "Battle of Neville's Cross," and "Battle of Flodden Field," are distinguished by an amount of careful antiquarian research as to the circumstances, actors, and scenes of those struggles, which leaves nothing to be desired. His last work of the kind was a still more elaborate study of the Battle of Bannockburn, in which he showed great ingenuity in applying the few contemporary notices to the minute identification of the scene of that conflict, a task of great difficulty on account of the complete change of the landscape in recent times. Mr. White had a large circle of literary friends, not only among the antiquarians of the north, but in all parts of the country. Nothing is yet stated as to the destination of his extensive library.

MR. J. A. H. MURRAY has in hand for the early English Text Society, the *Rhymes and Prophecies of Thomas of Ercildoune*, commonly called the Rhymer. The work as it exists in the MSS. consists of three "fyttes," the first describing the meeting of Thomas and the Queen of Faerie, and the second and third containing the "prophecies" which the "lovely lady" communicated to him ere they parted at Eildon Tree. Four MSS. exist containing the whole, and the fifth begins at fytte second, and contains the "prophecies." These MSS. differ from each other very greatly, especially in the second and third fyttes, which are probably considerably later than the narrative to which they are appended. The original germ of them was probably produced during the Scottish War of Independence to encourage the struggling patriots, and was afterwards altered and added to from age to age, down to as late a time as the Battle of Pinkie, each successive recension giving a sketch of events up to its own date under a prophetic guise with a more indefinite hint as to battles to come. It often happened that events falsified these forecasts, and it is interesting to see how in the next recension they are ingeniously altered so as to suit the now accomplished facts. From a comparison of these various alterations and additions Mr. Murray will probably be able to fix both the chronological order of the different texts and their approximate dates. The prophetic credit of Thomas continued down to the reign of our English James I., the accession of the Stuarts to the English throne being looked upon as a crowning proof of his power to see into the future.

M. JULES ANDRIEU, of 34 Richmond Gardens, Uxbridge Road, W., whose charming "Conférences sur l'Histoire des Idées et des Sentiments de la France par sa Littérature," held in a West End drawing-room, were a pleasing feature of last season, announces a second series for the present year, under the title of "Les Sources et les Ecrivains Originaux." The subjects of the lectures are as follows:—

Le Cycle Breton: Le roi Artus, Merlin, Joseph d'Arimathie, le saint Graal.

Le Cycle Carolingien: La Chanson de Roland, Renaud de Montauban, les douze Pairs.

Le Cycle Alexandrin: La chanson d'Antioche, les Paladins.

Le Kalevala: Poème national de la Finlande dont l'Homère vit encore.

La Satire au Moyen-Age: Les fabliaux, le Roman de la Rose.

Voyage au Pays de l'Astrée: Résurrection des idées celtiques.

Agrippa d'Aubigné, le soldat, le poète, le politique de la Réformation en France,—l'aïeul de Madame de Maintenon.

Mathurin Regnier:—La vraie satire, française et gauloise.

Cyrano de Bergerac: Son voyage à la Lune.

Les Inconnus du 18^e Siècle: Quand l'esprit règne, le cœur se cache.

The first lecture was delivered on Thursday the 12th instant at 5 P.M. The fee for the course is one guinea.

DR. WEYMOUTH has nearly ready a little volume entitled *Answers to Matriculation Questions in English*, which, under the form of hints to students, discusses many points in the history, grammar, present usages, &c., of the language, and will prove of interest and value to all students of English, whether preparing for examinations or not. In an appendix, Dr. Weymouth considers some of the chief points as to which different opinions are held by English scholars, to many of which he has himself given an independent investigation.

THE press threatens to become a power in Constantinople. The first part of a comic journal, *Le Polichinelle*, appeared on the 21st ultimo. It is to be published twice a week in French, Greek, Turkish, Armenian, and Bulgarian. We hope that it may display sufficient wit to stand the rather severe test of translation into so many widely-differing languages.

A FRENCH translation, with preface and commentary by M. Dupont-White, of Mill's *Liberty and Representative Government*, has been published in Paris by M. Guillaumin.

JOURNALISTS in the Turkish dominions have reason to be thankful for small mercies. The Rhodes correspondent of the *Levant Herald* mentions a report that the literary exiles, Midhat Bey and Tefvik Bey, have been authorised to send for their families, who are now at Constantinople, and who, on their arrival at Rhodes, will be allowed to live in houses situated within the fortified space wherein the exiles are confined. In other words, Midhat and Tefvik are about to be treated as exiles, and no longer as malefactors. Should the rumour be confirmed, the Government may be justly congratulated for discountenancing the unnecessary severity which the authorities have hitherto displayed towards the unfortunate journalists.

In giving a list of the earliest editions of Molière a few weeks ago, we should have mentioned that an edition of his nine earliest works appeared in 1666, but apparently without the author's supervision. Molière does not appear to have taken any more thought than Shakspeare for the readers of his works; for in the address to the reader which introduces *L'Amour Médecin*, he says, "On sait bien que les comédies ne sont faites que pour être jouées."

It appears that the late riots at Bombay were owing to the publication by a Parsee of a Guzerate version of Washington Irving's *Life of Mahomet*, in which there is a reference to the Prophet's domestic relations. The author attempted to stop the sale; but did not succeed in allaying the resentment of the Mussulmans, who were inflamed by the preaching of one of their priests, and by the approach of the festival of the Mohurram.

THE first parts have appeared of a Dutch translation of Mill's *Principles of Political Economy*.

THE death is announced, on February 8, of the Swedish poet, C. G. Strandberg, who was secretary of the Svenska Akademi for many years, and favourably known as an author by his paraphrases of Anacreon and Horace. He was born in 1825.

SINCE the expiration, in 1866, of the *Illustreret Nyhedsblad*, so admirably edited by Botten-Hansen, no first-class paper devoted to literature and art has existed in Norway. The *Nyhedsblad* had been the vehicle for some of the finest æsthetical work produced in the country; Asbjørnsen, Hænsteen, P. A. Munch, Ibsen, Bjørnsen, and other eminent writers had constantly contributed to it, and the gap its disappearance left has been painfully felt. At the beginning of this year an effort was made to revive the memory of the past by the creation of a new literary paper, *Ny Illustreret Tidende*, under the able editorship

of Hr. K. A. Winter-Hjelm. We cordially welcome this new serial, the first nine numbers of which have come into our hands. It seems to be conducted in an enlightened and liberal manner; and though its list of contributors does not number so many illustrious names as that of its predecessor did, we see no reason to anticipate that it will yield to it in general ability.

DR. BUCHHEIM, who edited the *German Classics for English Readers* in the Clarendon Press Series, has made a collection of German songs and lyrics, to be published in Messrs. Macmillan's Golden Treasury Series.

In the same series will shortly appear a little volume to be called *Scotch Songs*, of which the editor is Miss Mary Carlyle Aitken, a niece of Mr. Thomas Carlyle's.

A HISTORY of Dutch Literature, by M. W. Everts, taking, in many respects, a new view of the merits and demerits of Dutch authors, is already passing through a second edition. Jacob Cats, once the most popular poet of the Dutch people, receives here a severe lecture at the hands of M. Everts—on account of the immoral tendency of some of his tales!

It is announced that A. J. B. Beresford Hope, Esq., M.P., will preside at the festival in behalf of the funds of the News-vendors' Benevolent and Provident Institution on April 20, at the "Criterion," Piccadilly.

PROFESSOR LEO, of Berlin, promises the New Shakspeare Society a Paper in the autumn, consisting of a collection of notes and emendations on the text of Shakspeare.

WE are glad to hear that the Rev. Dr. Richard Morris has undertaken to edit a volume of Selections from the Minor Poems of Chaucer, for the Clarendon Press, as a companion volume to his little Selections from Chaucer's *Canterbury Tales*, now in its third edition. A further Selection from the *Canterbury Tales*, comprising all of those fit for boys (except the tales in Dr. Morris's volume), is also in preparation for the Clarendon Press Series by another editor. We believe that a selection from Wycliffe's works is also contemplated. Certainly one should find place alongside of those from "Piers Plowman" and Chaucer. We also call the Delegates' attention to the need of a book long since suggested to them, but then passed over, giving scenes of home and boy life, of manners and customs in Early England, so as to make young folk realise in a way that no so-called histories teach them, what life in Early England really was.

MR. T. CHRISTIE-MILLER, of Britwell, has been good enough to send the New Shakspeare Society a careful transcript of the unique Shakspeare-allusion ballad in his Heber collection of *Ballads and Broad-sides*. This ballad will, therefore, appear as No. 4 in the first part of *Shakspeare-Allusion Books*, which the New Society has now in the press. The first three allusion tracts, by Greene and Chettle, are all in type.

M. PAULIN PARIS has just completed an elaborate essay on the sources of the legend of *Tristan*, our "Sir Tristrem," which may possibly find its way into some volume of the Arthur Series of the Early English Text Society. M. P. Paris's second volume of his story of the old *Lancelot*, told in modern French, is in the press.

THE University Library of Strassburg has received an augmentation of 80,000 volumes during the past year, and now numbers about 300,000 volumes in all. Half of these additions, which constitute an augmentation more than fifteen times above the general average annual increase of public libraries, have been procured by purchase, and the remaining moiety has been obtained through public and private donations.

THE Cotta firm, at Stuttgart, announce the immediate publication in three volumes of Berthold Auerbach's novel, *Waldfried*, which we announced

several weeks ago, which will appear simultaneously in English, French, Russian, Dutch, Italian and Hungarian.

FROM Helsingfors, we hear that the Arctic regions have not fallen far short of more southern lands in doing honour to native distinction. On the 28th of February the Finnish poet, Runeberg, received on his seventieth birthday the congratulations of a whole nation, and his home at Borgo was the centre towards which flowed in copious streams the affectionate and laudatory homage of admiring friends from every part of Finland and Sweden, while the day was celebrated at Stockholm and Helsingfors by the performance at the principal theatres of the poet's most popular dramatic productions.

THERE is a pleasing revival of the study of Shakspeare in Dublin. A "University of Dublin Shakspeare Society" has just been formed, which already numbers seventy members, and will probably be affiliated to the New Shakspeare Society. Meetings are to be held at least once a month, at which papers will be read and discussed. The President is Mr. J. K. Ingram, Fellow of Trinity College, Dublin, and Regius Professor of Greek, to whose students they are free. Press of hearers at the second lecture necessitated the removal to a larger room than the Examination Hall, but it proved so bad a place for hearing that for the third lecture the audience had to be satisfied with the Divinity School, and to be reduced to the 250 people that the room will hold.

The Shakspeare lectures of Dr. Edward Dowden, Professor of English Literature in the University of Dublin, and one of the Vice-Presidents of the New Shakspeare Society, are being largely attended. They are delivered in connexion with the Alexandra (Women's) College, in Dublin, but in the Lecture Room of the Divinity School of Trinity College. In his third lecture Professor Dowden treated *Romeo and Juliet* and *Hamlet* as companion plays, Romeo being the man whose will was enfeebled by self-consciousness of the emotions (from which he is delivered only near the end of the play), while Hamlet was the man enfeebled by things reflecting and repeating themselves in his thoughts. So Juliet and Ophelia are a contrasted pair; likewise Horatio and Mercutio. Romeo was of Italy, the man of the South; Hamlet, a Teuton, the man of the North. *Romeo* the drama of passion, *Hamlet* the drama of thought. Professor Dowden's first series is to consist of six lectures; his second, of two.

It may interest English readers to see the books that the English Lector at Strassburg University is to read with his German students next summer term, so that they may contrast it with the public gratis teaching in German (if any) given in English universities. The Lector is a sort of assistant to the Professor. Here, then, is Mr. White's list of readings and exercises:—

Lecture: Poesie:—

Sir Walter Scott's Poems, mit Erklärungen in der englischen Sprache. 1 Stunde, gratis.

Lecture: Prosa:—

(1) *Lewes's Selections from Modern British Dramatists*, mit Erklärungen in der englischen Sprache. 1 Stunde, gratis.

(2) *Tom Brown's School Days*, by Thomas Hughes, Esq., M.P., mit Uebersetzungen. 1 Stunde, gratis.

Uebungen im englischen Stil—Conversation, Uebungen im Seminar für neuere Sprachen. 2 Stunde, privatissime und gratis.

Einführung in das Studium der englischen Sprache für Anfänger. 2 Stunden, privat.

Englische Grammatik und Conversation für Vorgerücktere. 2 Stunden, privat.

AMONG American publishers' announcements we notice *A History of Philosophy, from the Earliest Period to Sir William Hamilton*, by President McCosh, of Princetown College; and

The Philosophy of English Literature, by Professor John Bascom, of Williams College. The former is published by Messrs. Carter, Brothers, and the latter by Messrs. Putnam, of New York. Messrs. Macmillan will issue the first of these in this country, simultaneously with the American edition.

MESSRS. MACMILLAN have in the press a volume of selections from North's *Plutarch* of the passages illustrative of Shakespeare's plays, including some complete Lives. The editor is Mr. W. W. Skeat; and the book, whose aim is popular, will be called *Shakespeare's Plutarch*.

ACCORDING to the *Braunsch. Nachrichten* a fitting tribute is at last to be rendered to the memory of G. E. Lessing. The Duke of Brunswick has ordered a monument to be erected over the grave of the poet. The churchwardens of St. Magni have placed the necessary space, free of charge, at the disposal of the intendant of the ducal court theatre, under whose direction the necessary works are to be carried out.

WE understand that the fourth report of the Royal Commission on Historical Manuscripts will contain accounts of the private collections of the following noblemen and gentlemen in England and Wales:—The Marquis of Salisbury, the Marquis of Bath, the Marquis of Hertford, the Earl of Denbigh, Earl de la Warr, Lord de Ros, Lord Bagot, Lord Colchester, Lord Mostyn, Lord Fitzhardinge, Sir John Lawson, W. Beaumont, Esq., Lieut.-Col. Carew, J. R. Pine-Coffin, Esq., J. R. Ormsby Gore, Esq., M.P., Colonel Macaulay, M. Ridgway, Esq., J. J. Rogers, Esq., Colonel Towneley, and G. F. Wilbraham, Esq. Reports, too, will appear on the papers of the House of Lords, Westminster Abbey, Emmanuel and St. Catherine's Colleges at Cambridge, Balliol, Queen's, Magdalene, and St. John's Colleges at Oxford, the Corporations of Hythe and New Romney, &c., &c.

In Scotland the private muniments of the Duke of Argyll have been inspected and will be reported upon in this issue; as also those of the Countess of Rothes, the Marquis of Breadalbane, the Earl of Kinnoul, the Earl of Fife, the Earl of Selkirk, Lord Wharmcliffe, Lord Monboddo, the Hon. Mrs. Erskine Murray, Sir M. R. S. Stewart, James Buchan, Esq., C. Dalrymple, Esq., M.P., Colonel Farquharson, Colonel McDonall, Colonel Rattray and A. Wauchope, Esq.; while Ireland will be represented by the Marquis of Ormonde, Viscount Gormanstown, Sir R. O'Donnell, Trinity College, Dublin, &c., &c.

THE second volume of the *Calendar of State Papers, Ireland, James I.*, which is about to appear, embraces the period from October 1603, to July 1608. The most noticeable feature in it will be the documents relating to the history of the memorable flight of the Earls of Tyrone and Tyrconnel in 1607. To illustrate this event as much as possible selections have been made from the foreign despatches from Spain, Venice, and the Low Countries, hitherto in great part unknown. The Appendix will contain a chronological list of all Irish papers of the reign of James I., which form a portion of the invaluable private collection of the Marquis of Salisbury, and are preserved at Hatfield.

The third volume of the same *Calendar* is also nearly complete, and will contain the papers between July 1608 and the end of 1610. It will conclude with the instructive account of Sir Toby Caulfield, passed 29th December in the latter year, for the rents of the escheated counties, from the time of the flight of the earls. The preliminary history of the Ulster settlement may be said to form the principal contents of this volume.

IN describing last week some curious Irish Manuscripts which had been selected for illustration in the forthcoming *Fac-similes of National MSS. of Ireland*, we should have added that the task of selecting and editing all these specimens

is entrusted to Mr. J. T. Gilbert, F.S.A., Secretary of the Public Record Office of Ireland, and editor of *Historical and Municipal Documents of Ireland*, in the Rolls Series. We also omitted to mention "The Book of Leinster," said to have been compiled in the first half of the twelfth century by Finn Mac Gorman, Bishop of Kildare, by order of Aedh Mac Crimthainn, the tutor of Dermot, King of Leinster. The most remarkable page of this volume, which has been photo-zincographed, is a ground-plan of the banqueting hall of Tara. This plan is divided into five compartments, the centre of which contains the door, a rudely-drawn figure of a "daul" or waiter turning a gigantic spit, furnished with a joint of meat before a fire, the lamps, and a large double-handled vase or amphora for the cup-bearer to distribute. In the two compartments on either side are enumerated in order of precedence the various officers and retainers of the King's household, together with their tables, and the particular portions of meat served out to each; forming a very curious and instructive illustration of the social condition and habits of the early Irish. The description of the rations that were considered specially adapted to the several ranks of consumers is very amusing. For the distinguished men of literature "the soft, clean, smooth entrails," and a steak, cut from the choicest part of the animal, were set aside; the poet had a "good smooth" piece of the leg; the historian, "a crooked bone," probably a rib; the artificers, "a pig's shoulder;" the Druids, a "fair foot." These last are said to decline to drink; not so the trumpeters and cooks, who are to be allowed "cheering mead in abundance, not of a flatulent kind." The doorkeeper, "the noisy humorous fool and the fierce active kerne" had the chine; while with regard to the satirists and the "braightore," a class of buffoons whose peculiar function was to amuse the company after a fashion which not only will not bear description but almost defies belief—licensed and paid Aethons of the Court—"the fat of the shoulder was divided to them pleasantly."

MISS ELISE C. OTTÉ will publish shortly a *History of Scandinavia*, uniform with Mr. Freeman's *Old English History*.

It is announced that the tenth volume of Mr. Bancroft's *History of the United States* will soon appear, and that it will be the last one, Mr. Bancroft apparently preferring to bring his work to a close at what is a natural stopping-place—the end of the Revolution—to carrying it on further, as was his original intention. The ninth volume appeared more than seven years ago.

PROFESSOR STUBBS's edition of the *Lives of Archbishop Dunstan*, for the Master of the Rolls Series, is in the press, and will soon be published. It contains the life of the Saint from a MS. which has never before been collated, and also a large number of contemporary letters which have never been published. The letters, besides their immediate historical value, throw some light on the doubtful question of the knowledge of Greek existing in Western Europe during the Middle Ages. They contain many Greek words and forms, which seem to point to a wider and more common knowledge of Greek in Dunstan's time than is generally admitted.

THE Chetham Society, now in its thirty-first year, has held its annual meeting in Manchester this week. Its publications during 1873 were three in number, making the total number now issued ninety-three. The first was the second and concluding part of the Dr. Farmer Chetham MS., a commonplace book in the Chetham Library, temp. Elizabeth, James I., and Charles I., consisting of verse and prose, mostly hitherto unpublished. It was edited for the Society by the Rev. A. B. Grosart. The second publication was the fifth part of *Collectanea Anglo-Poetica*, by the Rev. Thomas Corser, M.A., which carries on the list from D (a) to Drant. Ninety-one volumes of poets are comprised within those limits,

including the works of Samuel Daniel, Sir John Davies, Francis Davison, Sir William Denny, John Donne, Gawin Douglas, and Thomas Drant. The remaining volume is a history of the parish of Kirkham, Lancashire, by Lieutenant-Colonel Henry Fishwick, author of a history of Goosnargh. At the meeting on Wednesday, the Rev. Canon Raine stated that a large body of materials relating to Humphrey Chetham and his family had been placed in his hands, and he gave a half-promise that he would prepare them for publication in some shape.

ON February 25, Mommsen's friends and pupils gave him a farewell dinner at Berlin, when, on his health being proposed, he announced that he would not go to Leipzig, but stay at Berlin. This announcement was received with great applause. Mommsen said in his speech that the German professor was no longer what he used to be. "Germany," he said, has advanced, but the German professor has fallen back. There was a time when the Universities alone kept the small spark of German unity alive. Now, new political powers have come to the front. But the German professor has still the noblest task, viz., to prepare the youth of Germany for their new duties. Our young men must learn that the ideals of humanity are an integral part of all education, and this they can only learn from a study of antiquity. What gives to German science its high position is the moral earnestness with which the German professor devotes himself to his subject, shunning all dilettante work, and deriving from the deep enjoyment in teaching the most powerful impulse to original research."

UNDER the somewhat ambiguous title of *By-gones* we are presented with a collection of notes, queries, and answers, which appeared from week to week in the *Oswestry Advertiser*, and in the *Cambrian News*, which emanates from the same border town of Oswestry, in the years 1871-73. These *By-gones* are stated to relate to "Wales and the border counties;" but more correctly they may be said to relate to the ancient principality of Powys, the district in which these papers principally circulate. These jottings contain a good deal that is interesting and curious respecting bygone times, and some of them are of considerable value. Of the latter class we would especially mention the numerous notices regarding Colonel Jones, the regicide, and Lewis Owen, generally called the Red Baron Owen, who was murdered by the Red Banditti of Mawddwy in 1555. Most of these contributions are from the pen of a well-known Merionethshire antiquary, who possesses sources of information not accessible to the general public. We hope, however, that we are to have no more extracts from the *Autobiography of Richard Davies*, the Montgomeryshire Quaker, a book which has gone through several editions, and is by no means scarce; and we much doubt the propriety of introducing into a work of this kind, which ought to be perfectly free from party bias, constant allusions to, and free remarks upon, the misguided zeal of some of the ecclesiastics of the latter half of the seventeenth century, as if their successors at the present day subscribed to their views, or were responsible for their conduct. Archaeology has no political or religious creed, and should not be made the vehicle of any dogmas. The index, which is only partially alphabetical, is not so complete or convenient as it might be; and we hope its deficiencies will be remedied in future instalments.

NOTES OF TRAVEL.

WE understand that the expenditure connected with the expedition that proceeded, under the command of Lieut. Cameron, R.N., to search for Dr. Livingstone, has quite exhausted the funds of the Livingstone Relief Expedition; and the Council of the Royal Geographical Society had a special meeting last week to take into consideration the steps necessary to raise supplies to meet fur-

ther expenditure. It was decided, we believe, that the Society should itself give a donation of 1,000*l.* to the Fund, and that an appeal should be made to the public to supplement this by subscriptions, necessary to meet the cost of the unforeseen expenses that are likely to be incurred by Lieut. Cameron's further progress to Ujiji, whither he has gone to fetch Livingstone's papers, and by the other circumstances connected with the death of Livingstone himself.

THE Amou-Daria expedition will follow the right bank of the river, and therefore will only need a trifling escort. It will only cross to the left bank if the authorities consider that no difficulties are likely to arise. The expedition will explore the course of the Amou-Daria, with an eye to ascertain its capacities for navigation, will determine the quantity of water in the river at different seasons of the year, will execute a series of meteorological, and probably also of magnetic observations, and study the movement of the sands in the deserts of the country.

It is said that several Russian capitalists intend this year to send a caravan to Afghanistan. It will go from Astrabad to Medched, Kandahar, and Kabul.

GEOGRAPHICAL research has lost another keen and zealous pioneer by the death, at Pisa, on February 24, of Baron Heinrich von Maltzan-Penzlin, at the age of forty-eight. Baron von Maltzan, who was not merely a traveller, but a good philologist and ethnologist, and a writer of ability and experience, had for years been a constant contributor to *Petermann's Mittheilungen*, and other leading German periodicals and daily papers. We regret to learn, through the communication of his friend, Herr August Leesenberg, that his death was self-inflicted, and was the result of excitement due to long-continued suffering from acute gastric neuralgia, to which he had been for years a martyr. The best and most important of his published works were his *Pilgrimage to Mecca*, *Three Years in North-Western Africa*, and *Social Pictures from Tunis and Algiers*. His intimate acquaintance with the languages and habits of the East had enabled him more than once, undetected, to join the ranks of native pilgrims and travellers, and had thus afforded him exceptional advantages for prosecuting his observations of the physical and social conditions of the districts through which he journeyed.

THE Chamber of Commerce at Trieste has this year been enriched with numerous valuable collections, the gift of Count Edmund Bethlen, who has conferred a still more important benefit on the association by presenting them with an interesting and explanatory report of his adventurous travels in Burmah. This enterprising traveller, who belongs to one of the oldest and most renowned families of Hungary, deviated so far from the usual practice of young men of his rank as to adopt the merchant service as his profession, and after having served for three years on board an Austrian merchant vessel, engaged in the China and Cochin China trade, he undertook for the Trieste Chamber of Commerce the special mission to Burmah, from which he has recently returned. Count Bethlen visited Rangoon, Maulmein, the Burmese capital Mandalay, and all the more important places on both sides of the Irawady, whose course he followed for more than 1,000 miles to Bhamo, which promises to become the great emporium of a colossal trade with Western China. At Mandalay the Count was presented to the Burmese sovereign, who showed an intimate acquaintance with public affairs in Europe, and an eager desire to enter into politico-commercial relations with the leading European states. The king presented the traveller with an artistically decorated book of prayers in the Pali language, and this, together with numerous interesting specimens of Burmese art and native industry, will form part of a collection, destined by the Count to enrich the National Museum at Pesth. The results of Count Bethlen's carefully

prosecuted observations of the commercial and industrial conditions of the little-known country through which he has passed can scarcely fail to prove of material advantage to the interests of Austrian trade, while his innate love of adventure, and his acute observing faculties, combine to make him a valuable auxiliary in the cause of geographical discovery. We shall hail with satisfaction the appearance of the work in which he has embodied the results of his mission to Burmah and the Celestial Empire.

THE French Geographical Society has decided unanimously that the sum of 3,000 francs, already voted to aid Francis Garnier in his explorations, shall be offered to his family as a small token of the gratitude of the society for his services to France and the cause of science.

A NEW line of telegraph wires, according to the Erzeroum correspondent of the *Levant Herald*, will be made in the spring to connect that town with Alexandropol in the Russian Caucasus. The line is urgently needed by the mercantile community of Erzeroum, which is in active commercial relations with Alexandropol. It is thought probable also that the Government will sanction the construction of a line from Bayazid, in Kurdistan, to the Persian frontier.

THE Athens correspondent of the *Levant Herald* says that a powder magazine is being built on the desert but historic island of Psytalia, lying between the Piræus and the Bay of Salamis. The road leading from Athens to the royal summer seat of Dicelia has been reconstructed; the picturesque Phaleron road is to be equally repaired and embellished, so as to serve also as a pleasant drive; the more important work of planning the network of roads which is to traverse the provinces of Attica and Boeotia has also been completed, and these roads, amounting to 110 kilomètres, will be at once taken in hand; in the province of Messinia, the roads from Calamata to the town of Messinia, from Messinia to Bouka, and thence to the sea-shore, have just been completed; and three important bridges on the Houria, and one on the Zephyriminion, will be ready for public use within the present month. The works for the draining of the marsh of Asprochoma, in the same province, have been offered to public competition. It is also said that the well-known French engineer, M. Piat, is about to construct a tramway from Nauplia to Argos—a distance of 11 kilomètres—at the expense and for the account of the communes of those two towns.

In our review, last week, of Mr. Charles New's *Life, Wanderings and Labours in Eastern Africa*, we gave Messrs. H. S. King & Co. the credit of being the publishers. The book is really published by Messrs. Hodder and Stoughton.

By an article in the existing treaties with Japan, foreigners are not allowed to travel beyond a certain specified distance from each of the open ports. For some time the Japanese have, of their own accord, practically waived their rights in this respect, and have allowed foreigners to move about more freely in the empire. Recently, however, in consequence of the foreign envoys having definitively refused to give up their extra-territorial jurisdiction over their own countrymen, the Japanese authorities have retaliated by withdrawing the privilege they had conceded. This retrograde step on their part has not unnaturally caused much irritation, and the German envoy, Herr von Brandt, is understood to have taken up the following rather extraordinary position in the matter:—

"He claims that inasmuch as existing treaties exclude all foreigners from the interior of the empire, the Japanese have already violated it by introducing foreign teachers, &c., for the instruction of their youths, the development of their mineral resources, and other kindred purposes. On this ground the minister proposes to resist the exclusion of any of his

countrymen who choose to travel beyond the prescribed limits, either for pleasure or trade."

We are not much surprised to learn that "the native authorities are firm in their resistance to what they call a 'monstrous assumption.'"

DR. MEYER, who has been travelling in the East Indian Archipelago during the last few years, and M. Miklucho-Maclay, known for his researches in New Guinea, have both paid attention to the ethnology of some of the islands in those regions, and they agree in establishing a close affinity between the Negritos of the Philippines and the Papuans of New Guinea. According to the first-named traveller, the Negritos form the aborigines of the islands in the Archipelago, and at the time of the landing of the Spanish had already been driven inland by an invasion of Malays. The former tribe are thus generally found in the mountains, and the latter on the coast. M. Maclay has traced the same type of countenance among the natives of the New Hebrides, and the likeness is carried still further by a comparison of the songs and dances. He does not incline to the commonly received opinion that there are two distinct races in New Guinea; the type is everywhere Papuan, he considers, but comprises several subdivisions widely differing in characteristics.

MR. FLEAY'S PAPER ON METRICAL TESTS.

New Shakspeare Society.

ON Friday, the 13th instant, this paper was read at the Society's first meeting at University College, London. Mr. Fleay began his argument by stating the work he had as yet accomplished in this direction. He then dwelt on the necessity of a quantitative criticism, which should remove all questions respecting authorship and chronological succession of authors' works from the domain of the vague guess-work, founded on subjective impressions, to that of exact science resting on objective facts of such a nature as to be counted and measured. Facts of this kind exist in the metre of the early dramatists. Each one of them differs from every other in salient characteristics; the number of rhyming lines, of lines with double endings, of stopped lines, &c. For the more distinct illustration of these differences, a passage of Dryden was given, rewritten by Mr. Fleay in five different manners, viz., those of Fletcher, Beaumont, Massinger, Greene, and Rowley. But the discrimination of authorship being the special business of the second paper, he passed to the consideration of the chronological order of the plays of Shakspeare. By comparing plays known to have been produced near the beginning and end of his career, Mr. Fleay showed that Shakspeare gradually introduced into his work double endings, Alexandrines, and short lines; and specially that he gave up the rhymed line in favour of blank verse. He gave an elaborate table of the metre of all the plays, stating for every play the total number of lines, the number of lines in prose and blank verse, rhymes, short rhymes, songs, double endings, alternate rhymes, sonnets, dogrel, and lines of one, two, three, four, six, measures respectively. From this table he deduced the following conclusions:—

1. That the *Taming of the Shrew*, *Henry VI.*, and *Titus Andronicus*, are in the main not Shakspeare's; but productions of the Greene and Marlowe school.
2. That *Henry VIII.* and *The Two Noble Kinsmen* are partly Fletcher's.
3. That *Pericles* and *Timon of Athens* are only in part Shakspeare's.

(These three propositions will not be discussed until the papers on the separate plays are read.)

4. That the chronological succession of Shakspeare's plays is given in the following table:—

I. RHYMING PERIOD.—'Love's Labor's Lost'; 'Love's Labor's Won'; 'Comedy of Errors'; 'Midsummer Night's Dream'; 'Romeo and Juliet'; 'Lucrèce'; 'Richard II.'

II. COMEDY AND HISTORY PERIOD.—'Two Gen-

tlemen of Verona'; 'Richard III.'; 'Merchant of Venice'; 'John'; '1 Henry IV.'; '2 Henry IV.'; 'Much Ado about Nothing'; 'Henry V.'; 'Twelfth Night'; 'Merry Wives of Windsor'; 'As you like it.'

III. TRAGEDY PERIOD.—'All's well that ends well'; part of 'Henry VIII.'; 'Troilus and Cressida'; 'Measure for Measure'; 'Macbeth'; 'Cymbeline'; 'Hamlet'; 'Othello'; 'Lear'; parts of 'Pericles' and 'Timon.'

IV. ROMAN PERIOD, &c.—'Julius Caesar'; 'Antony and Cleopatra'; 'Coriolanus'; 'Tempest'; part of 'Two Noble Kinsmen'; 'Winter's Tale.'

Mr. Fleay then enlarged on the position of some of the plays in the table, especially that of the *Two Gentlemen of Verona*, *Midsummer Night's Dream*, and *Macbeth*, explained such points in the construction of the table as required it, and gave some confirmatory matter in support of his conclusions, with one extract from which we conclude:—

"The first ten plays in this list, which are fixed in that position by the rhyme tests solely, are the ten plays given in Meere's list. Now, the chance of selecting these ten plays out of the thirty which are undoubtedly Shakspeare's, is less than one in twenty millions: the exact calculation by the doctrine of chances is that one chance only in 20,030,010, would hit on this precise selection of plays. To any mind familiar with the exact sciences, this fact alone is conclusive as to the immense value of the rhyme test."

Had Mr. Fleay included *Titus Andronicus*, the odds would have been still greater; but he did not treat at all of the doubtful plays in this first paper.

THE FRENCH ACADEMY.

THE French Academy has deferred the reception of M. Emile Ollivier more in sorrow than in anger; and there is a considerable category of English spectators who will fail to sympathise with either sentiment. The Academy is only reaping what it sowed—wearing the sackcloth it wove for itself in Imperial days when sackcloth looked like enduring purple, receiving the ashes of that sudden ardent enthusiasm for the Liberal Empire. The Forty, or at least the official spokesman of the Forty, are plaintive in their protestations of regret at being compelled to create another Academician *in partibus*. They were conciliatory, they say, courteous, deferential; they merely "wanted to know," and M. Ollivier declined for obvious reasons to gratify the modest desire. Succinctly narrated, this is the history of the ceremonious broil in which all literary Paris has been hotly engaged for the last ten days. M. Ollivier has spent three years in Switzerland, studying art-history and translating Italian poets, waiting for the wind of ill-favour to blow over. His re-entrance into public life was to be inaugurated by the public reception at the Academy; and pressed by one or two Bonapartist members, ashamed of its repentance, the supreme intellectual corporation selected introducers and a respondent, and informed the ex-Minister that the *discours de réception* might be presented, and the usual understanding arrived at between the two orators of the occasion. M. Ollivier's panegyric of Lamartine was pronounced presentable in all save the particular pointed out by M. Guizot. Shorn of the oratorical embellishments of the famous advocate, it is not a very remarkable piece of literature, even among *discours de réception*. M. Ollivier has taken advantage of Lamartine's bygone rhetorical celebrity to introduce a number of unnecessary reflections, having generally an egotistic tendency, on the art and function of the public speaker. Thus the last Liberal Minister of the Empire enumerates the classic qualities of the orator, with a side glance at the looking-glass, as "broad general information, literary sentiment, wealth of imagination, the elegant and delicate urbanity that springs from real mental culture, and lastly the elevation of tone

that comes from strong conviction." And again, he informs us that he "is subject to fits of oratorical intoxication which, while increasing the lucidity of his mind, render it impossible for him to contain his thoughts." But the most objectionable feature in the speech (in the sight of the Orleanist Forty) is the laboured introduction of political sentimentality into an essay which would have been quite sentimental enough had its strictures and apologies been confined to the original subject—Alphonse de Lamartine. The obnoxious phrase has already been extensively quoted. It was merely a somewhat elegiac and hyperbolic description of certain graces of manner, a certain dreamy benevolence undoubtedly possessed by Napoleon III. But, unimportant as the declaration was, it offended M. Guizot—and M. Guizot is in reality the dictator of the Academy. Louis Philippe's minister observed hotly that it might be permissible on the eve of a deadly war to have *le cœur léger*, but *l'esprit léger* was not allowed in the Academy—which it certainly is not. This puerile outburst does not seem to have been immediately resented by M. Ollivier. It was only when conciliatory hands were stretched out to him a day or two afterwards that he declared himself *outragé*, and declined to discuss the question of the discourse with the Academical committee. It is very possible that an Academical dispute had occurred to him as a more effective way of re-appearing on the political scene than an Academical reception ceremony. The calculation, if calculation there was, has succeeded. M. Ollivier's speech will be criticised at the Antipodes, and the Minister himself become for a season the petted martyr of the irregulars of literature. M. Ollivier will have the *cafés* for him; but he is not without partisans in the Academy. M. Thiers, who was prudently absent during the recent difficulty, strongly advocated the Minister's election in 1870. The poet M. Camille Doucet, Octave Feuillet, even Alexandre Dumas, are more or less platonic lovers of Bonapartism, while Emile Augier, who was to answer M. Ollivier, is frankly Imperialist in faith. M. Augier's essay is printed, and contrasts favourably with the vague and involved rhetoric of the recipient. It re-establishes the blurred portrait of Lamartine in clearer and truer outlines, though the composition is defaced by that excessive praise which the Academy invariably awards to its members—when they have vacated their fauteuils. M. Augier cites an anecdote of Lamartine which describes exactly the hyperbolic style, the lofty vanity of *Jocelyn*. On his first election he was asked on which side he would sit in the Chamber. "Au plafond," Lamartine answered.

It is rumoured that M. Ollivier intends to appeal to a court of law against the decision of the Academy. It is pointed out by some of his partisans that M. Guizot's criticisms were the more ungracious because he received many benefits from the Empire, and actually favoured the Minister's election. The plea that political questions should not be treated in an Academical discourse is an unfortunate slip. Political manifestations are encouraged by the Forty—but they must be in favour of Orleanism.

CORRESPONDENCE.

THE PRESENCE OF THE KING IN HIS COURTS OF LAW.

7 King's Bench Walk: Feb. 26, 1874.

Perhaps a word or two from one to whom the antiquities of the law are possibly more familiar than to either Mr. Gardiner or Mr. James Collier, may be of service in reference to the debated question of the period when the right of the king to sit and adjudicate in his courts was successfully challenged.

Let me, however, first recall to Mr. Gardiner's recollection the fact that the twelfth volume of *Coke's Reports* has never been considered an "original authority."* It was published many years after Lord Coke's death, notwithstanding his express wish that nothing of his should be put forth to the world posthumously; and, from loose notes "believed to be" his, pieced together no one knows how or by whom, and not without suspicion of interpolations and suppressions. It is, therefore, hardly fair to the greatest constitutional lawyer of his day, to deduce from these

* Wallace's *Reporters*, 3rd edition, 1855, p. 115, for contemporary opinion; Hargrave's note to ii. *State Trials*, p. 381; and Frazer's note to the last edition of *Coke's Reports*, vol. vi. fly-leaf to Part xii.

stray leaves of dubious authenticity an inference of his "ignorance of history" or an assertion of a constitutional "first decision" which marks an epoch in our progressive development.

The truth is, that until the end of the reign of Henry III. our kings, like their neighbours the French sovereigns, had been wont to sit personally in their courts of law. We are all familiar with the oft-told tale of St. Louis beneath the oak trying the causes of the poor and oppressed, in the same century as that in which our Henry III. sat in the Painted Chamber at Westminster. De Joinville's description of St. Louis thus adjudicating presents us with a contemporary record of the primitive administration of justice by that king; and the rolls cited by Madox, to which Mr. Collier has made reference, and some others collected by Prynne (*Animadversions*, &c., p. 53), are satisfactory proofs of the practice of our own monarch about the same time; the record cited by Prynne being the most express.

Bracton, a judge under Henry III., whose systematic treatise on law was certainly made public about 1270 and largely circulated, and was subsequently twice printed, was the first writer who dreamt of any impropriety in the personal presence of the sovereign in his own courts. His reasons, however, are taken rather out of the magazines of scholastic philosophy than founded on common sense. Nevertheless, he pronounced against royal interference (fo. 119 and fo. 369); and from that day until this no king has ventured to deliver judgment by his own mouth in any cause, civil or criminal, in any regularly constituted court of law.

Of course, no reliance can be placed on the loose statements of the royal presence in the courts, such as those from Stow, for curiosity, or the desire to see the laws enforced, might account for such rare visits; but, as Lord Hale states in his *Analysis of the Law*, p. 17, "whenever the king sat there in person, the judgment was always given by the justices."

Fortescue (*De Legibus*, cap. viii., "proprio ore nullus Regum Angliæ judicium proferre usus est") is perhaps the most satisfactory original authority; for what Bracton rather suggested than insisted on, Fortescue emphatically enunciates as the law of the land. Compare Montesquieu, bk. vi., cap. v.

It must not be supposed that the ultimate judicial prerogative of royalty—the right, if not obligation, of the king in last resort, in emergency, to decide as judge—is affected by the settled rule of non-intervention in cases in which constitutionally appointed judges are officiating.

ALFRED CUTBILL.

TROYLUS AND CRESSIDA.

Skipton Grammar School: March 9.

In your report of Mr. Hales's second lecture I observe that he states of *Troilus and Cressida* that part of it was probably written by some one else than Shakspeare. I am not aware that this theory has been hitherto admitted by any Shaksperian critic of eminence, and therefore I infer that Mr. Hales must have very strong grounds indeed for making this assertion, which I sincerely hope he will publish. In the meanwhile, as a firm believer in the undivided authorship of this play, I shall be glad if you can find room to publish my explanation of the peculiarities which it presents to us: if it is the right one, it will throw light upon many other disputed questions regarding the arrangement of the plays and the manner of work of our great author.

Now, even a casual reading of this play leaves one with the impression that it is composed of two parts which do not form portions of an organic whole. In the Grecian tents the utterances of Nestor, Agamemnon, and Ulysses are replete with wisdom, vigorous in manner, free in rhythm, and in fact in the very best style of Shakspeare's third period, the time of *Hamlet* and *Leor*. In the

house of Pandarus, in the scenes between Troylus and Cressid, there is youthful passion and verbal wit of the same kind as we find in the earliest plays, those of the first period, especially in *Romeo and Juliet*: in fact, in these two plays (*Romeo and Juliet* and *Troylus and Cressida*) there are more *doubles entendres*, there is a greater tendency to what I may call the licentiousness of Fletcher, than in any other part of Shakspeare's writings of the same extent. In Fletcher this delight in filthy talk was permanent, in Shakspeare it wore out with advance of years and of wisdom. This difference of manner and matter in the two parts of our play must, I say, strike even the casual reader.

But if we read the play carefully through with a special eye to these differences; if we notice the suddenness with which the change of atmosphere strikes us when we pass from the hothouse of the first two scenes to the breezy open naturalness of the third: the painful revulsion we feel in returning to the Troylus story at the beginning of the third act: the relief once more experienced in the third scene of that act when we meet again with the Grecian generals: the painful relapse at the beginning of the fourth act: the relief in the fifth scene, which remains unbroken to the end of the play except by act v., sc. 2, and a few isolated lines:—if we note all this, we cannot help enquiring whether the cause of these alternations of feeling lies in the subject-matter, or if there is something radically different in the manner of these distinct portions of the text. On further examination we find that there are two distinct stories as well as distinct treatments, and that the part which repels us is the story of Cressida's unfaithfulness, "with the conceited wooing of Pandarus, Prince of Lycia:" while the part which we remember with pleasure is the challenge of Hector, the pride of Ajax, the wrath of Achilles, the wisdom of Ulysses. These parts are clearly separable: the Cressida story is contained in act i., sc. 1, 2, act iii., sc. 1, 2, act iv., sc. 1, 2, 3, 4, and a few lines in sc. v., viz. ll. 11-63 and 276-293, and act v. sc. 2. The rest of the play, except a few lines scattered in act v., as in sc. 3, ll. 98-102, is entirely independent and might have been published separately. But I cannot assert too strongly that each part is distinctly Shakspeare's, and that the inferiority of one to the other must be accounted for without introducing the hypothesis of a second author.

Now I cannot go into the metrical evidence here in detail: it would be too technical, and I have done so already in a paper for the New Shakspeare Society, which I hope will soon be published; but I may here state that the metre of the Cressid part is exactly that of *Romeo and Juliet*, with a slight dash of *Richard II.*; while the metre of the Achilles part is that of *Macbeth* and *Othello*. What can be plainer than that we have here a play finished about 1603, but begun some ten years before and laid aside? At the time of his reading Chaucer, from whom he took his Theseus and his Pyramus for *Midsummer Night's Dream*, Shakspeare was struck with the story of *Troylus and Cressida*, and began a play on that subject; but finding that he could not satisfactorily fill up five acts with it, or disgusted with his own picture of Cressida, he laid it by, until on reading Chapman's *Homer* it struck him that here was the material for filling up his long-neglected canvas to the extent required by the help of the story of *Achilles*. This was common with Shakspeare: I can prove that his *Timon* and *Pericles* were left unfinished just in this way, and afterwards extended to five acts by other hands. His *Henry VIII.* and *The Two Noble Kinsmen* have long been shown to have been thus filled up by Fletcher, and I hope also to show that *All's Well that Ends Well* has been treated by himself just as this play of *Troylus and Cressida* was. But there is another argument not technical, and, if true, of great value for other purposes.

Gervinus noticed long since the convenience of treating two or more of Shakspeare's plays

together for critical purposes; but I am not aware that anyone has noticed that the whole of his comedies, if not his tragedies, can be grouped in pairs according to their subject-matter; the plays in each pair being strongly contrasted with each other in other respects. Thus, there can be no doubt that *Love's Labour's Lost* and *Love's Labour's Won* must have formed a pair so contrasted, whatever this latter play may have been, and quite independently of the question whether any of it is preserved to us in *All's Well that Ends Well*. So the *Comedy of Errors* and *Midsummer Night's Dream* form a pair: the former might be called the Errors of a Day and the latter the Errors of a Night: but the errors in the former arise from a freak of Nature; in the latter from the far more variable and inconstant tendencies of the human heart. The *Two Gentlemen of Verona* and the *Merchant of Venice* form another pair; in both alike the chief subject is two friends, but in one the unfaithfulness and the other the faithfulness of friendship is the theme dwelt on. The *Merry Wives of Windsor* and *Much Ado About Nothing* form another pair; in fact the latter title would have done for either play: but the jealousy of Ford is causeless and ridiculous; the jealousy of Claudio is based on strong external grounds and excites our sympathy. In *What You Will* (*Twelfth Night*) and *As You Like It*, the titles prepare us for similarity: it is not so strongly marked; but in each the main plot turns on a girl disguised as a boy making love to a man indirectly while he is unaware of the disguise. In *All's Well that Ends Well* and *Measure for Measure*, a wife obtains the restoration of an unworthy husband by the same device. And finally, in the *Tempest* and *Winter's Tale*, the restoration of two persons supposed dead (a parent and a daughter in each case), and the love-making of the daughter with the son of an imagined enemy, are our chief objects of interest.

Now it is very singular that in the instances of every one of these pairs the metrical tests assign dates for the two plays which are components of each pair so close that we cannot, as far as that evidence goes, assign them to positions of more than one year apart; and so in the case of this play of *Troylus and Cressida*. The place the Cressida part would occupy on rhythmical grounds would be next after *Romeo and Juliet*, and the plot is exactly that which would serve as a contrast to this play. The one of "true and faithful Juliet" and "her Romeo," the other of Cressida false than "fox to lamb or wolf to heifer's calf, pard to the hind or stepdame to her son," and her Troylus; the one resisting the seductions of her nurse, the other yielding instantly to the suggestions of Pandarus; the one constant to her husband when the marriage with Paris to a worldly mind would have been so tempting; the other false to her lover with no temptation beyond an innate lustfulness. This pair of plays would be an excellent pendant to what I have ventured to call the Faithful Friend and the Unfaithful Friends above; and in each case there is the same correspondence between the minor characters. As Pandarus corresponds to the Nurse, so does Lucetta to Nerissa, and Launce to Lancelot Gobbo: compare especially the scenes of the enumerations of the ladies' suitors, and the incidents of the rings in these plays.

But we are straying from our subject too far. My object is to show that this play was partly written at an early date (probably 1594 or thereabouts), and that there is no necessity for the hypothesis of two authors. The difference of style, difference of subject, difference of rhythm, suggest this; the fact that the two plots can be separated with ease (a most unusual phenomenon in Shakspeare) confirms it, and the parallelism with *Romeo and Juliet* of the love part of the play, which is so strikingly like what I have shown to exist in other plays, is an evidence so cumulative as to render it to me impossible to resist absolute conviction of the truth of the theory here advanced.

F. G. FLEAY.

JEWISH GRAVES IN THE CRIMEA.

Bodleian Library, Oxford, Mar. 4.

Abraham Firkovitz, the well-known owner of the celebrated collection of the old Pentateuch rolls and the Karaitic MSS., now in the Imperial Library of St. Petersburg, has brought out a volume on Tomb Inscriptions of the Jews in the Crimea. This publication, which forms a first volume (the second will contain, according to the author's statement, the colophons of the Pentateuch rolls and of some old biblical MSS.), has the title of *Abné Zikkaron* (Stones of Memory), and was published at Wilna, 1872. It contains 564 tomb inscriptions, from A.D. 6 to 1841, to be found at Shufut Qaleh (near Eupatoria); 5 others from A.D. 910 to 1104, to be found at Sulkath; 70 from A.D. 866 to 1777, to be found at Manguf; 29 from A.D. 1078 to 1845, at Kafa; and 96 from A.D. 1593 to 1852, at Gozlow (Eupatoria). Eight of the earliest inscriptions were published, with fac-similes by myself, in the *Mélanges Asiatiques*, St. Petersburg, 1864, and Professor Chwolson also devoted to the same inscriptions a memoir published in the *Transactions of the Academy of St. Petersburg*. Finally, they were made known to the English public by Dr. Davidson, in the *Theological Review*, 1868, in a paper assuming apparently to be original, and mentioning, just incidentally, the above-named two articles on the subject! M. Firkovitz begins his volume with a rather prolix preface of 104 pages in Hebrew, in which he describes his travels to different congregations, in order to investigate, by order of the Government, the date of the establishment of the Jews in the Crimea. We cannot expect any critical result from a self-taught amateur of the somewhat advanced age of eighty-five years, narrow-minded, and most partial to the Karaitic views, and above all residing in a country where he could scarcely get any assistance from modern publications. He quotes some Arabic documents on the conversion of the Khazars, but from secondary and even later sources, such as Rapoport and others. In spite of all these deficiencies the book is interesting, for we know very little of these remote Jewish congregations; besides, the author gives from time to time an account of manuscripts which he was able to acquire, and of others which, belonging to synagogues, he was only able to see. He mentions, beside fragments of the Old Testament, a Hebrew-Persian dictionary of R. Y'hudah hap-Parsi (about 850), without giving any more exact description of it. The Jewish congregations of the Crimea and the Caucasus, we may say, remain still unexplored. What light those old manuscripts might throw on the Scripture and the early Jewish literature! At the end of the volume are some poetry and fac-similes of ten inscriptions.

AD. NEUBAUER.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Mar. 14,	1 p.m.	Sale of Lord Dunmore's Water-colours at Christie's.
	3 p.m.	Crystal Palace Concert. Saturday Popular Concert (Joachim and Hallé).
		Royal Institution: Mr. Newton on "Ephesus."—I.
	3.45 p.m.	Royal Botanic Society.
MONDAY, Mar. 16,	3 p.m.	Asiatic.
	4 p.m.	London Institution.
	7 p.m.	Entomological.
	8 p.m.	Medical. Monday Popular Concert (Joachim, Dannreuther).
	8.30 p.m.	Royal United Service Institution. Mr. B. J. Reid on "Ironclad Navies."
TUESDAY, Mar. 17,	1 p.m.	Sale of Old China at Sotheby's.
	3 and 5 p.m.	Irish Ballad Concerts (St. James's Hall).
	3 p.m.	Royal Institution: Prof. Tyndall.
	7.45 p.m.	Statistical.
	8 p.m.	Civil Engineers: Discussions on Gun Carriages and Heavy Ordnance. Pathological. An-

- thropological. Society of Arts : Hon. T. Shepston's Paper on "The Diamond Fields of South Africa."
- 8.30 p.m. Zoological : Prof. Huxley on "The Structure of the Skull and of the Head of the *Menobranchus*."
- WEDNESDAY, Mar. 18. 1 p.m. Sale of Engravings at Sotheby's.
7 p.m. Meteorological. London Institution : Travers' Course.
8 p.m. Society of Arts : Mr. Hawes on "The Channel Tunnel."
" Mr. Coenen's Third Concert.
" Last Ballad Concert.
- THURSDAY, Mar. 19. 1 p.m. Sale of old Sèvres China at Christie's.
3 p.m. Royal Institution : Prof. Williamson.
4 p.m. Zoological.
6 p.m. Royal Society Club.
7 p.m. Numismatic.
8 p.m. Sullivan's *Light of the World* at the Royal Albert Hall. Linnean. Chemical.
- 8.30 p.m. Antiquaries. Royal.
FRIDAY, Mar. 20. 1 p.m. Sale of Mr. Thomas Green's pictures at Christie's.
1 p.m. Sale of Dr. Gray's Library at Sotheby's.
7.30 p.m. Macfarren's *St. John the Baptist* at Exeter Hall.
8 p.m. Philological : Mr. Sweet on "The History of English Sounds."
" Royal Institution : Dr. Carpenter on "The Temperature of the Atlantic."

SCIENCE.

RECENT PROGRESS IN THE THEORY OF ELECTRODYNAMICS.

- A Dynamical Theory of the Electromagnetic Field.* By A. Maxwell. (*Philos. Trans. of the Royal Society*, 1865.)
- Die Principien der Elektrodynamik: Nachrichten von d. Königl. Ges. d. Wiss. zu Göttingen*, 16 Juni 1868. Von C. Neumann. (Tübingen, 1868.)
- Ueber die Bewegungsgleichungen der Elektrizität für ruhende leitende Körper.* Von H. Helmholtz. (*Borchardt's Journal für Mathematik*, Bd. 72.) *Ibid.*, Bd. 75.
- A Treatise on Electricity and Magnetism.* By J. Clerk Maxwell. (Oxford, 1873.) Two volumes.
- Ueber die den Kräften elektrodynamischen Ursprungs zuzuschreibenden Elementargesetze.* (*Abh. d. Königl. Sächsischen Ges. d. Wiss.* Bd. X. Von C. Neumann.)
- Die elektrischen Kräfte*, Bd. I. Von C. Neumann. (Leipzig, 1873.)
- Vergleich des Ampèreschen und Neumannschen Gesetzes für die elektrodynamischen Kräfte* (*Monatsber. d. Akad. d. Wiss. zu Berlin*, 6 Febr. 1873). Von H. Helmholtz.

THE problem of determining the primary causes of the so-called electromagnetic and electrodynamic phenomena is connected intrinsically with some of the most important theoretical questions of natural philosophy regarding the general character of Force, and the essential attributes to be ascribed to the medium which fills space. The subject, therefore, has attracted the attention of natural philosophers and mathematicians since the time of Oersted's first discovery regarding the deviation of a magnetic needle by a galvanic current, in 1820, till the present moment; and this attention has grown even the more intense and concentrated, the more our knowledge of the experimental facts approached to completeness. The force of gravitation, Newton's grand conception, has been hitherto the model for nearly all the scientific hypotheses by which philosophers have striven to connect and to explain the various kinds of physical and chemical phenomena. Hypotheses of this

kind, based on the assumption of forces acting between two material points along the straight line of their junction, either attracting or repelling, the intensity of which is independent of time and velocity, but dependent on the distance of the two points, have been applied with great success, not only to the effects of celestial and terrestrial gravity, but also to those of elasticity in rigid, fluid, and gaseous bodies, including the phenomena of sound and light. In the theory of heat and chemical actions it appears highly probable that we have to do with forces of the same kind, although of a much more limited sphere of activity. In consequence of the extreme complexity of causes and conditions, only very small parts of these branches of science have been worked out so far that the connexion between actual phenomena and elementary forces can be traced the whole way, and deduced by mathematical analysis. The nearest analogy with the laws of gravitation we find in the phenomena of electricity and magnetism, as long as these agents are in a state of repose and equilibrium. We find the same law of action at a distance, and the inferences derived from this law are even more open to controlling experimental measurements of the highest degree of precision than those of gravitation or of the molecular forces, which keep up the motion of heat, produce chemical combinations, and are the alternate cause of elasticity. The very existence of the electrostatic and magnetic forces must have increased a good deal the tendency of natural philosophers to generalise this kind of hypothesis, which answered so well to the requirements of science, and to consider the attributes of these forces, enumerated above, as the general and necessary attributes of all ultimate forces of nature.

In order to distinguish the forces of this description by a short name, I may be allowed to call them forces of the first class. Forces, the intensity of which depends either on time or on velocity, may be disposed of in a second class.

Are there really alternate and elementary forces, which are to be reckoned into this second class, which cannot be reduced into an aggregate of forces of the first class, and do not bend under that great generalisation, like the majority of other physical and chemical forces? This is, evidently, a question of the highest theoretical interest, and the problem of electrodynamics turns out so important, because the so-called electrodynamic forces, acting between two electric currents, or between one such current and a magnet, seemed really to afford an example of the second class.

First among them we have the discovery by Oersted of the forces moving ponderable matter (*ponderomotor* forces, according to Professor C. Neumann's nomenclature), and the laws of their action were brought into a relatively simple, accurate, and comprehensive formula by Ampère. These forces are completely latent, as long as electricity is in a state of rest; they become active when electricity begins to flow through conducting bodies. This appears as a first fundamental difference between electrodynamic forces and those of the first class, a

general characteristic of which is, that their action is not at all altered by any motion of the points between which they act. - Secondly, the electromagnetic force of a galvanic wire carries the pole of a magnet round the wire without end and without ever leading it to a place of equilibrium and rest. All the forces of the first class, on the contrary, tend to carry the bodies which they move to a certain final resting-place. This relation, moreover, is reciprocal. For just as a magnetic pole is carried round an electric current, a galvanic wire can be carried around a magnet or around a coil of wire, through which an electric current passes.

A second class of electrodynamic phenomena are the induced currents discovered by Faraday in 1831. In these cases the electrodynamic forces do not act on ponderable matter, but they act as *electromotor* forces on electricity itself. They drive the opposite electric fluids of a wire into opposite directions, either when another wire carrying an electric current is in motion relatively to the first wire, or when the intensity of the current in the second wire is altered. Instead of the second wire a magnet may be substituted. It produces an induced electromotoric force either when it is moved or when the intensity of its magnetism is altered. For all these electrodynamic actions a magnet may be considered always as a system of electric currents, flowing circularly around the magnetic axis of every magnetised particle.

These electromotor forces, induced by electrodynamic action, show the same character as the ponderomotor forces, before mentioned. They depend on motion and the lines, along which they act, are closed lines without end, for a magnet losing its magnetism induces electromotor forces in circular directions all around its axis.

In spite of this fundamental difference, it has been proved by the experiments of Mr. J. Prescott Joule and by the general theoretical deductions of Sir W. Thomson and myself, that all the known effects of electrodynamic action are subject to the great principle of Conservation of Energy, although a theoretical deduction of this universal principle of Nature can be given only for forces of the first class, which are independent of motion, and which tend always to a final position of equilibrium. It can be proved that when an electric current, by moving a magnet, does mechanical work, the current, induced by the motion of the magnet, alters the relation between the chemical processes going on in the battery, and the heat evolved in the galvanic circuit, so that a part of the chemical forces is not spent on the production of heat, but used for the mechanical work of the electrodynamic forces.

There are two principal questions, which have been discussed in the papers enumerated above, the one a question of fact, the other a question of theory.

The first is this. Hitherto we know with some degree of accuracy the electrodynamic actions of closed galvanic currents only, viz. of currents which circulate along a closed line or a system of closed lines, and have no end, where electricity would be obliged to stop

and to accumulate. The investigations of Ampère, Gauss, Neumann senior, Kirchhoff, W. Thomson, &c., have led to a highly developed mathematical theory of closed currents, which enables us to calculate their electrodynamic effects for circuits of any length and form, and which has been compared with actual experimental measurements of the highest degree of precision.

But there exist also currents with ends, as for instance those produced by the discharge of a Leyden battery in the wire which connects the tinfoil coatings of the glass jars. These coatings are the ends of the conducting wire, and they are separated by the insulating glass of the jars. We know that the wire produces electrodynamic effects during the discharge, like a wire closing together the ends of a galvanic battery, and that the currents in such a wire go to and fro, oscillating between the two tinfoil coatings. But we do not yet know experimentally, how far these electrodynamic actions are modified at the place where the conducting circuit is interrupted by the insulating glass. This question may be of little practical importance, because the actions in question cannot but be very feeble, and it will require great experimental skill to make them visible. On the other hand, in order to define the ultimate causes of electrodynamic actions, it is necessary to know with certainty the part which every linear element of a current contributes to its general effect, and the linear elements even of a closed circuit are not closed lines, but lines with two ends.

Ampère has derived his well-known law of the attracting or repelling force between two linear elements of electric currents, not however without introducing into his reasoning a hypothesis. He assumed, namely, that between every pair of such elements there acts only one force, not a couple of forces, and that the direction of this force is the straight line joining the centre of the elements.

Another elementary law was derived from the phenomena of induced currents at first by Gauss, as early as 1835, but not published, and afterwards by Professor F. E. Neumann (senior) of Königsberg in 1845. The mathematical expression of this law was based on the value of the mechanical work which could be done by Ampère's forces, or as it was called, in analogy with the nomenclature applied by Green and Gauss to magnetic and electrostatic forces, on the value of the electro-dynamic potential of two currents. This value again was determined completely only for closed circuits, but its mathematical expression led to a value of the same quantity also for linear elements, which is much less complicated than that of Ampère's forces. To calculate it take the product (1) of the intensities of the two currents, (2) of the length of both the linear elements, (3) of the cosine of the angle between the directions of the latter, and divide by their distance.

Taken negatively, this potential expresses the potential energy of the ponderomotoric forces, which is spent when two currents move without altering their intensity, and the forces can be calculated from the value of this energy by well-known methods.

Taken positively, the same potential gives the value of the energy, which is equivalent to the existing motion of electricity, and which is spent in induced currents, if the intensity of the currents or their position in space is altered. In this way this whole chapter of physics, containing the greatest variety of new and surprising phenomena, has been brought under one most simple law.

As I have said already, the value of the electrodynamic potential is completely determined for closed circuits, but not for linear elements. To the latter certain arbitrary functions may be added without altering the potential of closed circuits; Neumann had already remarked this ambiguity. In my first paper, quoted above sub. No. 3, I have treated this question, and have striven to find out such consequences of the theory, as might lead to an experimental decision of the problematical point. I limited the arbitrariness of the unknown function by the assumption that the law according to which the unknown part of the potential depends on distance, is the same as for the known part. Then the whole uncertainty is reduced to the value of one unknown constant, which plays in the theory of electricity nearly the same part as the second constant of elasticity, in the theory of elastic solids. I was able to decide one important point, at least, namely, that this new constant cannot have a negative value, without producing an unstable equilibrium of electricity in conducting bodies. Under such an assumption certain motions of electricity, as, for instance, radial oscillations in a conducting sphere, ought to grow without end in intensity and to produce an infinite quantity of motion and of heat, which, of course, must be regarded as impossible. This inference was of some importance for our choice between the different theories of electrodynamics, because it showed that the laws of induced currents, derived from the hypothesis of W. Weber, and in the same way those derived from the different hypothesis which Professor C. Neumann (the son) has proposed (No. 2, 6, 7, quoted above), are inadmissible, leading, as they do, to unstable equilibrium of electricity. I do not think that my objections (No. 3 and 4) have been invalidated by the arguments brought against them by my opponents; but this I must leave to the judgment of my mathematical readers.

I may omit here, perhaps, another point of discussion. Mr. C. Neumann believed that the law of the forces derived from the value of the potential led to inferences opposed to the results of experiment in those cases where one part of the conducting wire slides along the surface of another part of the same circuit. I have striven to prove (No 8) that there is no contradiction between the law of the potential, rightly interpreted, and the observed facts.

The potential theory, when applied to the calculation of the ponderomotoric forces, produced by and acting on not closed circuits, gives not only forces acting between two linear elements of electric currents, according to the law of Ampère, but also other forces acting between the end of a current and a linear element of another, and forces acting between two ends. At the extremities of an

open stream-line quantities of free electricity are either appearing or vanishing. We may say, therefore, that those forces are acting between electricity in *statu nascendi* and streaming electricity.

It was not difficult to prove, that the law of the electrodynamic potential was in accordance with the principle of conservation of energy, even for currents with open ends. It was to be questioned, if the same is the case for the original law of Ampère. This question has been investigated by Mr. Neumann junior, in his papers No. 6 and 7. He bases his reasoning on the supposition, that forces, one of which acts between every pair of linear elements of currents, are the only ponderomotoric forces existing. Besides, he supposes that the forces of superimposed currents are simply superimposed themselves, and that the principle of conservation of energy is valid. He concludes from a very clever and skilful analysis, that these assumptions are sufficient to determine all the questionable points. But the law of induction, produced by change of intensity, which results from his analysis, corresponds to an unstable equilibrium of electricity, and to a negative value of the constant, introduced by myself. I infer, therefore, from the results arrived at by Professor C. Neumann, that his hypothesis is inadmissible, and that there must exist, in reality, other ponderomotoric forces at the ends of currents, beside those of Ampère. I think that the theory based on the existence of an electrodynamic potential is the only theory hitherto known which gives a complete and unobjectionable expression of all the different classes of electrodynamic phenomena. It is recommended, besides, by the extreme simplicity of its fundamental law.

Now we come to the second fundamental question. It must not be forgotten that the mathematical laws, hitherto spoken of, give not an explanation of the ultimate *vera causa* of electrodynamic effects, but only a comprehensive and precise determination of their quantitative value. They perform as much for the knowledge of these actions, as the laws of Kepler did for Astronomy. But the work of Newton has also to be done for this branch of science.

In order to find the real elementary causes of electrodynamic effects, two different ways have been followed, the one by Gauss, the other by Faraday.

Gauss thought that the distinguishing peculiarities of electrodynamic forces might depend on the time which they required to reach distant points of space. Among the papers published after his death in the collection of his works, there are some very remarkable attempts of this kind. One of these papers, written in 1834 (Gauss, *Werke*, Bd. v. p. 617) contains the nucleus of a theory similar to that published some time later by his friend and colleague, Professor W. Weber, and perhaps even less objectionable. But Gauss did not publish anything about this subject.

"Nil actum reputans, si quid superesset agendum," as he says himself.

Among the theories of this kind which have received the most elaborate development, and have met for a long time

with the almost general assent of continental philosophers at least, was the theory of Professor W. Weber, of Göttingen. It has played a prominent part as the theoretical basis of the highly important experimental measurements, by which Professor Weber determined the fundamental natural constants of this branch of science. According to this hypothesis every quantum of electricity exerts upon every other quantum a force, the value of which not only depends on the actual distance of the two electric quanta, but also on the velocity with which this distance is changed, and on the acceleration of this velocity.

Sir W. Thomson and Professor P. G. Tait were the first who pronounced this hypothesis of Weber to be contradictory to the principle of conservation of energy, without specifying their objection. I was led to the same inference by independent investigations, as mentioned above.

Besides this, the late Professor Riemann of Göttingen, and Professor C. Neumann junior, have tried to develop the idea of Gauss. The latter has given a relatively simple mathematical form to the assumptions necessary for this end. These assumptions, interpreted physically, are rather startling, and, besides, this hypothesis leads to the same contradiction of the law of conservation of energy, as the law of Weber. Hitherto, therefore, the theoretical attempts of this class have not been very successful.

Another way has been entered upon by Faraday. He objected to all forces acting into distance without intermediate links of connection, and he endeavoured to show that electric forces spread out by contiguous modifications of the medium, filling the space between the electrified bodies. He succeeded, at least, in proving that electric, as well as magnetic action into distance, is not independent of the medium, through which it is propagated; and the phenomena of diamagnetism, discovered by him, go on in such a way as if diamagnetic bodies had even less magnetic polarity than the ether of a vacuum. Faraday concluded from his researches that the molecules of electric insulators (dielectric media) are influenced in the same way by electric forces, as the molecules of magnetisable bodies are influenced by magnetism, that a separation of the two electricities, or as he calls it, *dielectric polarisation*, goes on in the first case, as there is a separation of the magnetic fluids, or *magnetic polarisation* in the second. Professor C. Maxwell has brought these conceptions of Faraday into a precise mathematical form. He dispenses completely with forces acting into distance, and assumes actions going on in every elementary volume of ether of the same direction and of the same kind as the electro-magnetic actions between magnets and galvanic conductors of common size and distance. According to his opinion, every change of magnetic polarisation in an elementary volume of ether produces in the same element an electric force of a circular direction around that of the magnetic momentum, and every change of dielectric polarisation, which is equivalent to a flow of electricity through the molecule, produces magnetic force, acting in a circular direction through

the same molecule. In the interior of electric conductors he supposes that dielectric polarisation is continually fading away by a certain imperfect elasticity of the ether. These assumptions give, indeed, a sufficient basis for the development of a complete mathematical theory of electrostatic, electrodynamic and magnetic phenomena. It is in perfect accordance with the results of experiments hitherto performed, and with the laws derived from the existence of an electrodynamic potential, at least for moderate distances, through which light is propagated in a time, the duration of which may be neglected. But the theory of Maxwell also indicates that electrodynamic action is not propagated instantaneously into distance, and it is highly remarkable that the velocity of the propagation, calculated from experimental data, which were obtained at first by W. Weber, coincides almost perfectly with the velocity of light. This coincidence had been remarked before by Kirchhoff for the propagation of electric currents in conductors of infinitely small resistance. An ether, indeed, with the faculty of electric and magnetic polarisation which Professor Maxwell ascribes to the ether of insulating media, can propagate transverse electric and magnetic oscillations with the velocity of light. Magnetic and electric oscillations must be combined in this case always in such a way that their directions are perpendicular to each other and to the direction of propagation. The old undulatory theory of light, in which the mechanical attributes of a rigid elastic solid are ascribed to the ether, is beset with many theoretical difficulties. It appears that the new electromagnetic theory of light answers better in some cases, as for instance in the theory of reflection and refraction; whether it does so everywhere, must be decided by its further elaboration. This natural and unsought-for connection of the new electromagnetic theory with the theory of light is, indeed, an important success, which gives rise to the greatest hopes for the future.

In his former papers Professor Maxwell has already shown that the same kind of influence which, according to his electrodynamic theory, neighbouring elementary volumes of ether have upon each other, can be imitated by a mechanism, containing a system of rotatory elastic spheres, every one of which acts on its neighbours by means of a system of friction-balls, interposed between them. Such a mechanism may appear rather too complicated for the structure of the ether: nevertheless it is a result of great general importance, that actions, the laws of which are congruent with those of electrodynamic phenomena, can be produced by the play of common mechanical forces.

Recently Professor Clerk Maxwell has given in his treatise (p. iii. ch. 6) a more general and abstract demonstration of the same result, derived from Lagrange's (or Hamilton's) general principles of mechanics. He takes for that end the electrodynamic potential, as expressing the *vis viva* of all the known and unknown motions, which are connected necessarily with the motion of electricity in a conductor. Without any

special assumption about the nature of these motions, the laws of ponderomotoric and induced electromotoric force may be deduced from this conception in its most general form. This shows again, that electrodynamic forces are subject to the same general principles of action, as common mechanical forces.

The two volumes lately published by Professor Maxwell contain not only this new theory, but a very complete, methodical, and clear exposition of all those parts of electric science, which could be brought under precise theoretical conceptions and be developed mathematically. He has done a great service by this work to every student of physics. Hitherto we were obliged to search after the papers treating the different parts of this subject through a great number of scientific periodicals and books. Besides, in relation to the original parts of the book, principally those treating of the ultimate causes of electrodynamic action, I do not hesitate to say that I consider his method of forming new theoretical conceptions, which are at the same time perfectly definite in their quantitative determination, and yet as general as possible, and not more specified than is needed, or than our present knowledge of the facts allows, as really a model of cautious scientific progress.

H. HELMHOLTZ.

SCHOOL BOOKS.

- (1) *The Letters of Cicero to Atticus*. Book I. With Notes and an Essay on the Character of the Author. Edited by Alfred Pretor, M.A., Fellow of St. Catharine's College, Cambridge. (Cambridge: Deighton, Bell, & Co. London: Bell & Daldy. 1873.)
- (2) *Selected Letters of Cicero*. With Notes for the Use of Schools. By the late Constantine E. Prichard, M.A., formerly Fellow of Balliol College, and Edward R. Bernard, M.A., Fellow of Magdalen College. (Clarendon Press Series, 1872.)
- (3) *Selected Letters of Pliny*. For the Use of Schools. By the same Editors. (Clarendon Press Series, 1872.)

THE two first-mentioned editions deserve a special welcome, as they are sure to help on the intelligent study of Cicero in our classical schools. The plan of the books is different. Mr. Pretor has confined himself to the first book of the letters to Atticus, and aims apparently as much at encouraging the study of Latin as at introducing the student to the history of the Ciceronian epoch. His notes, which are full and careful, are interspersed with long and numerous pieces of translation, on which he has evidently spent great pains, and which offer, as a whole, very fair models of English for retranslation into Latin. We do not ourselves approve of the growing custom of filling notes with translations, which, it appears to us, must have a levelling tendency, and help to crush original effort in teacher and scholar alike; but this is a matter of opinion, and there can, we think, be little doubt as to the thoroughness of Mr. Pretor's work in the direction which he has thought right to follow. It is a pity that so good a scholar should not have spent a few hours' more work on his orthography, and on the arrangement of the letters. Until editors make up their minds to spell Latin correctly where correctness is attainable, there is little doubt that schoolmasters will continue to be wavering and sceptical on a point which seems unimportant because it is minute. Mr. Pretor still prints *ceteri, intelligo, negligo, ocium, nuncio*. As to the arrangement, it would surely have been better to

print the letters in chronological order. As it is, the student has to leap from the year 689 to 688, thence back to 686, thence forward again to 687 and 693, thus losing all the continuous thread of the history.

Mr. Pretor's notes are always scholarly and interesting. One or two points have suggested themselves to us in reading them: for instance, in the well-known description of the Clodian jury, we are still inclined to think that the words "tribuni non tam ærati quam quod vocantur ærarii" refer to bribery. "Nummatus" means monied, "nummarius" mercenary; may not "æratus" and "ærarius" be applied in the same way? The ærarian tribunes would be the poorest of the three bodies represented on the jury. A more important point is raised by an emendation introduced by Mr. Pretor in the 13th section of Letter 16. Here the Medicean MS. gives "Lurco . . . qui magistratum insimul cum lege Ælia iniit." For this jumble Mr. Pretor reads, "simul contra legem Æliam iniit." Mr. Munro suggests, "insimulatam lege Ælia." A third possibility seems open, namely, that "in" in the combination "insimul" stands for some verb, such as "invasit," of which "iniit" was a gloss; and that the sentence ran originally, "qui magistratum invasit" (or some other equivalent word) "simul cum lege Ælia:." "who made a raid on his office and the Ælian law at once."

The essay on the character of Cicero is too good to be passed over without discussion. Though we do not understand Mr. Pretor to endorse the unworthy invective of Mommsen, his verdict on Cicero's character is decidedly unfavourable. In passing we should remark that, on page xiii., he speaks of the verdict of Dio as the verdict of antiquity: but was not the verdict of antiquity as divided as our own? Asconius and the Roman writers of the first century A.D. represent quite a different opinion from that adopted by Dio, to whom, indeed, Plutarch offers an interesting contrast. But to leave the ancients and return to Mr. Pretor. "My own opinion," he says, "that Cicero's character is a weak and selfish one, has only been confirmed by a more careful study of his works; nor can I read the panegyrics which have been lavished upon him without a real feeling of surprise that such scanty materials should have been found sufficient for the construction of this gigantic idol." "For myself," he concludes, "with the exception of his marvellous power as an orator and writer, I can, I confess, see little in our author to command our admiration or respect." The degree of our admiration and respect, in any given case of human character, must of course be relative to circumstances; and while we have no desire to make an idol of Cicero, we may at least claim that he should be judged as a man among men. We have no wish to deny or extenuate his vanity or his irresolution. But we think that his political inconsistency and his selfishness in private life have been exaggerated, both by Mr. Pretor and by those historians to whose verdict he subscribes. It should be remembered that Cicero was a "novus homo" and an "eques;" that his "novitas" made him exaggerate the value and distinction of high public office, which men of patrician or noble family were able to estimate more calmly; that he had no gift or taste for military achievement; that his talents were those of an orator and a writer; and that his education and habits were those of an advocate. What were his chances of distinction in Rome as it then was? He might, it is true, have chosen a purely literary or philosophical career, either from the first, or (like Rutilius Rufus) after his exile: and it would have been better for himself and for Roman literature had he done so. But he chose to mingle in politics at a time when politics were, as far as we can see, a mere tangle of selfish and conflicting interests. What leading man of the time—unless, like Cato, he preferred to live as the citizen of an invisible polity—comes out clean-handed? What party was not as much ambitious for itself as for the Republic, and unscrupulous as

to the means it adopted? On the other hand, what hope of distinction was there for one who would not throw himself unconditionally into the ranks of a party? Now, Cicero's politics were, in spite of many waverings and hesitations, on the whole what might be expected: they were the politics of the equestrian order. And here it should be remembered how strong an influence family tradition had at this time in determining a man's political action. It is true that the policy of the equites could not be dignified or thoroughgoing: they were obliged, for the sake of quiet, to coquet alternately with the optimates and with the democrats, whom they equally detested. But Cicero's political action was on the whole, with tolerable consistency, the natural action for a man in his position. He was representing the equites against Sulla when he defended Roscius; against the senatorial *judicia* when he attacked Verres; against the Gaulish provincials when he defended Fonteius. In the proposals to glorify Pompeius with extraordinary commissions against the pirates and against Mithradates, the equites and the democrats were agreed against the extreme optimates; and in the following years Cicero remained true to the popular hero whom the democrats had abandoned. Mr. Pretor speaks of Cicero's friendship (perhaps too strong a word to apply at any time) for Pompeius as having been preceded by the bitterest enmity towards him (p. xiv.). But where is the authority for this statement? The conduct of Cicero in the case of the bribery commissions, and of the Asiatic equites, may be explained, though not excused, by these considerations; but in dealing with the Roman politics of this period we often find that explanation is the only excuse for doubtful acts. As to Cicero's defence, or intended defence, of Catiline on his trial for embezzlement (and his words in the *Pro Sulla*, c. 30, "Catilinæ consul non adfui," look as if the defence was actually undertaken), it may be observed that Catiline was acquitted by the votes of the equites and the ærarian tribunes, which looks as if there were political complications in the background to which we have lost the clue; also that Cicero's act was one of those which men of stronger wills and clearer sight than Cicero occasionally allowed themselves. Cæsar, with all his devotion to the Marian traditions, did not scruple, for the sake of a passing alliance with the Catilinarians, to acquit—alone among the bloodhounds of Sulla—the murderer of Marius Gratidianus. The condemnation of Licinius Macer, for which Mr. Pretor blames Cicero, is surely, on the whole, to his credit: the alliance with C. Antonius was forced upon him as the least of two evils.

We may add that Cicero's training as an advocate made him lean towards regarding political questions, the real bearings of which he seldom clearly apprehended, as matter for mere argumentation (witness the transparent special pleading of his second speech on the agrarian law of Rullus). Hence, also, the obvious influence on his character of the general tone of the contemporary Roman advocates, who seem, speaking generally, to have owned no higher duty than that of standing by one's friend.

We cannot altogether subscribe to Mr. Pretor's charge against Cicero of selfishness in his private relations with Atticus and others. Cases there may be of selfishness revealed in the mass of correspondence preserved; but the impression left by chance expressions in correspondence is often likely to be exaggerated, especially when you have the letters of one correspondent only, and that correspondent a man of vehement and sensitive feelings.

The interest of the subject has made us unduly prolong these observations, and shorten the space left for noticing the excellent joint work of Mr. Bernard and Mr. Prichard. The plan of their book is, as before noticed, different from Mr. Pretor's. Their collection comprises some sixty letters, selected from the whole body of Cicero's correspondence and arranged in chronological order. Prefixed to the whole is an account of the state of

the text of the letters, and a short life of the writer. The notes are very careful, and well adapted for school purposes. We find an inaccuracy on p. 100, where it is said that Torquatus took the place of Clodius as accuser of Catiline. Unless we are mistaken, Torquatus was one of Catiline's defenders. In the notes on the letter describing Cæsar's visit to Cicero, we are sorry to see that the editors have not adopted Mr. Munro's explanation of "ιμερικῶν agebat," "he was under a course of emetic treatment;" which is surely more natural than making "agebat"="he was intending to take." We must also enter a protest against translating "collegia" by "trades-unions" (p. 114).

The letters of the younger Pliny, giving a picture of the Roman world in another phase, have an interest quite different from those of Cicero. Mr. Prichard and Mr. Bernard have annotated a selection from them in the careful style of which the book just noticed is so good a specimen. We could have wished that they had taken the trouble to arrange the letters in chronological order, and that they had mentioned in their preface the admirable essay on the life of the younger Pliny contributed a few years ago by Mommsen to the *Hermes*. Except in the matter of the arrangement of the letters, the book is written on the same plan as the *Cicero*; a short account of the text as settled by Keil, and a short life of Pliny, being prefixed. The orthography adopted in both books is quite satisfactory.

H. NETTLESHIP.

NOTES AND NEWS.

M. F. A. FOREL, of Morges, gives a detailed account in the *Bulletin de la Société Vaudoise des Sciences Naturelles*, vol. xii. No. 70, of the periodical fluctuations which have been known to exist ever since the early part of the century in the level of the Lake of Geneva. The amount of this fluctuation of level varies greatly at different times, and generally coincides with a sudden rise or fall of the barometer. M. Forel, therefore, considers its cause to be a difference in the pressure of the atmosphere at different parts of the lake, though it may occasionally be affected also by slight earthquake waves.

HERR ADOLF MAYER has been pursuing a series of experiments of some importance to agriculturists, for the purpose of determining whether plants have the power of absorbing ammonia through their aerial parts as well as through their roots. He claims to have established that they possess this power both with respect to gaseous and to dissolved carbonate of ammonia.

HANSTEIN has observed, in a series of experiments, chiefly on unicellular Algae (*Vaucheria*), that an external injury to the protoplasm of a growing cell has a tendency to cause an immediate secretion of a layer of cellulose, or cell-wall, as a protection against the injury. He has also made the singular observation that, during the repair of such an injury, the grains of chlorophyll remove altogether from the part of the cell where the formation of the new cell-wall is taking place, and do not return to it until the healing is completed. He believes that the grains of chlorophyll are never at rest during the life of the plant. —(*Botanische Zeitung*, 1873, No. 44.)

THE periodical (diurnal and nocturnal) movements of the leaves and flowers of plants have been a subject of close observation for some years past by Darwin in this country, and by Sachs and Pfeffer in Germany. The ordinary explanation of the cause of this phenomenon (which includes the opening of flowers by day and their closing by night) is a difference in tension between the two sides of the leaf or petal caused by a difference in the "turgescence" or amount of water in the cells on the two sides of the organ. Herr Batalin has been re-investigating this phenomenon afresh with great care, and believes that the move-

ments are caused, at least for the greater part, rather by unequal growth on the two sides, the result of differences in light, temperature, and turgescence.—(*Flora*, 1873, Nos. 28, 29).

THE Jardin des Plantes at Paris has just received from the Philippine Islands ten living vampire bats. Their bodies are as large as pigeons, their wings extending a foot and a half, making their total expansion between three and four feet. They sleep the greater part of their time, and notwithstanding the bloodthirsty propensities ascribed to them, these Cheiroptera of the Philippines are a simple fruit-eating race.

THE ravages of the new and formidable insect-pest, known to entomologists as *Phylloxera vastatrix*, are exciting the gravest apprehensions in all the vine-growing districts of France and Germany. The Austro-Hungarian Government has published an ordinance forbidding the introduction within the frontiers of the monarchy, of vines having the roots attached to them, or of grapes, if packed in vine leaves; and the Imperial Government of Germany has, it is said, in contemplation to adopt a similar policy with regard to the importation of vines and grapes from North America, which is known to be the native *habitat* of the *Phylloxera*, or from France, in which the noxious insect is believed to have become thoroughly established. Its history and mode of propagation have been described in a carefully-written *résumé* by M. Planchon, in the 1st February number of the *Revue des deux Mondes*; and from this report it would appear that it was noticed as early as 1854 in the State of New York, by Asa Fitch, who gave it the name of *Pemphigus vitifoliae*, but seems to have had no suspicion of its destructive propensities. After being made the subject of repeated observations by different entomologists, and being doomed to receive various names in accordance with the different sexual and local conditions under which it first presented itself for observation, Messieurs Labinau and Planchon, while engaged officially in investigating the causes of a new vine disease in France in 1869, convinced themselves of the identity of the protean forms under which the vine-destroyer had manifested itself, which we are henceforth to recognise under the name of *Phylloxera vastatrix*. The rapidity of its progress through France and Portugal is truly marvellous; in the former country it has two special *foci* of destruction—viz., in the south-east and in the Bordelaise; and in the latter a widely-extending centre at Oporto. America is the undoubted source of the evil, and in every instance where the insect has appeared its presence may be traced to the direct agency of plants imported from the American Continent. A commission has been entrusted by the French Government with the task of trying to discover the agents which nature or science can contribute to its extermination; and, according to Mr. Riley, of St. Louis, the roots of the infected vines may be made to propagate the antidote to their own bane in the form of a little white acar, which thrives and multiplies on the eggs of the phylloxera, and has received the name of *Tyroglyphus phylloxerae*. It remains to be seen whether this enemy provided by nature, or the chemical agents suggested by M. Planchon, will prove of any avail; or whether it may not be necessary, as the latter writer seems to infer, to eradicate all old plants and introduce new stocks of American vines, which seem to enjoy an immunity from the ravages of the *Phylloxera* in its worst form. At all events the peril is imminent, and, unless a remedy can speedily be discovered, there seems to be no ground for hoping that any of our vine-growing districts can be kept secure from the invasion of this insect and from consequent eventual destruction.

WITH regard to the ten-lined potato bug described in our last issue, a letter has been received from the Privy Council Office, in answer to a communication from the Central Chamber of

Agriculture, to the effect that, according to the American official reports, it does not appear that the eggs or larvae of the Colorado beetle have been or are deposited or conveyed in the tuber of the potato, and, therefore, there is considered to be no reason to prevent the importation of seed potatoes from America into the United Kingdom, until the case is proved to be otherwise.

IN the course of his lectures during the present term at the Clarendon Laboratory, Oxford, Prof. Clifton has exhibited a very interesting series of photographs of interference and diffraction phenomena. The photographs were obtained by receiving the shadows, &c., on prepared plates instead of an ordinary screen, and they were then projected on the screen of the lecture-room by means of a lime-light, the impression produced on the sensitive plate being in some cases magnified to 2,500 diameters. The diagrams included interference phenomena produced by Fresnel's prism, diffraction bands bordering the shadows of a straight edge and an angular aperture, the internal interference bands in the shadow of a wire and a needle, the shadow of a small circular disk, and the phenomena presented by light which has passed through a small circular hole. The Professor stated his belief that similar photographs had never previously been made available for lecture-room purposes.

THE journals announce a heavy hailstorm upon Mount St. Gothard. Professor Kenngott of Zurich analysed some of the hailstones and obtained crystals of a pure white, consisting of chlorate of sodium—sea salt. More singular still were the hailstones observed by Professor Eversmann at Kasan, containing crystals of iron pyrites, produced no doubt from the disintegration of some granite rock, and taken up by a tempest into the clouds.

A NEW minor planet has been found by Professor Peters in America, making a total of 135 of these small bodies discovered up to the present time. By a very liberal arrangement on the part of the Atlantic and other telegraph companies concerned, messages announcing such discoveries are transmitted free, and accordingly the details were in this case communicated without loss of time to the principal European observatories, thanks to which, two determinations of the planet's place were secured on this side of the Atlantic, so that there is now no fear of this planet being lost as soon as found, a catastrophe which has already happened more than once in similar cases.

Naturforscher (March 7) narrates the exhumation, by M. Rivière, of a human skeleton of the diluvial age from the caverns of Bouscè-Roussée at Ventiniglia near Mentone. The cavern is from 27 to 28 mètres above the sea-level and 12 mètres deep. The ground is covered by a reddish conglomerate to a depth of rather more than a metre, beneath which were large blocks of stone apparently heaped up about the entrance. Among these blocks were the first traces of human habitation. Scattered about were bones of the genera *Cervus* and *Capra*, with shells of *Patella* and *Mytilus*, and a few stone implements. At a depth of 3.75 mètres beneath this upper habitation was found in February 1873 a second, with numerous remains of animals, which placed its age beyond doubt, and in the midst of them a human skeleton. The remains included bones of *Ursus spelaeus*, *Bos primigenius*, the horse, hyaena, marmot, and several species of stag, but no reindeer, as well as numerous remains of birds and of land and marine Mollusca. The implements belong to the earliest stone-age, and are in no case polished; some of the smaller ones are made of quartzite or felsite. The human skeleton is not in so good a state of preservation as the one previously discovered by M. Rivière near Mentone, in 1872; it lay stretched on its back, and its height must have been 2 or 2.05 mètres (i.e. a little over 6½ feet); the bones were all coloured red by iron, and the skeleton was

covered by a layer of earth containing iron, which M. Rivière suggests had been brought for the purpose of burial. The skeleton appears to have certainly belonged to the earlier stone age, about the close of the epoch of the cave bear and *Rhinoceros trichorhinus*.

THE Zoological Society of London have just made an important addition to their collection in the shape of a Javan rhinoceros (*Rhinoceros sondaicus*), which was received from Java on Saturday last, and is the first animal of the species ever brought alive to Europe. There were already representatives of three species of these huge animals in the Society's gardens. This makes a fourth, and renders the series nearly complete, only two other rhinoceroses being certainly known to exist. The Javan rhinoceros occupies the "stall" in the new elephant house, rendered vacant by the decease of the old Indian female rhinoceros.

THE correspondent of the *Times* writes from Naples on the 3rd instant as follows:—

"Vesuvius has been making some demonstrations since last Sunday week, just sufficient, perhaps, to justify the predictions of Professor Palmieri. 'On the 22nd ult.,' says Cozzolino, the guide, in a report which he has sent to me, 'we felt several shocks of earthquake without being able to detect the direction from which they came. On the following day I went up Vesuvius, and found the new crater, which was formed in 1872, at least a portion of it corresponding to the Observatory, thrown into the air. This was the more apparent from a quantity of "basaltic" stones on the borders of the mountain, which had been ejected from that cone. The part of the cone which has suffered has disclosed many fissures of great depth.' This slight eruption, however, if so it may be called, has not produced any results of importance. The mountain still smokes, and at times sends forth considerable volumes, awaking expectations of something more serious, and then the column falls as if Vesuvius had expended all its power. It is evidently in a state of great agitation, for strong detonations are heard at times, and severe shocks felt. One watches Vesuvius with greater interest from the contrast which the snows on its summit present with the hot vapour which rises constantly, and the burning lava which boils at no great depth. Whether we shall have a grand display, which is equivalent to a great disaster, or whether the mountain will fritter away its force in petty demonstrations, not even our Professor can tell; but enough is to be seen to constitute a remarkable phenomenon. It may have been a consequence of other than volcanic causes that about the same time as these shocks were felt; the road from Castellamare to Sorrento was again obstructed by the fall of huge fragments of the mountains which hang over it in one direction. These obstructions, indeed, occur almost annually to the great annoyance of the public, and though the heavy rains we have lately had may reasonably be supposed to have had some effect, it is equally reasonable to suppose that the subterranean action which is now considerable in this neighbourhood may have lent its assistance. Communication by rail between Cava and Vietri also was interrupted the week before last for a day or so, as the road was washed away by the heavy rains. These are, however, trifles only of a temporary character."

THE fiftieth anniversary of Professor Poggenдорff's connexion with the valuable chemical journal known to all chemists under the name of *Poggenдорff's Annalen*, was commemorated by the presentation to him at Berlin, on March 7, of an electric chain, possessing the peculiarity of being composed of silver and gold Prussian coins of the realm. The Italian Government marked its sense of the services rendered to science by the able and indefatigable German chemist, by expressing officially its sympathy with the objects of the Berlin festival, and presenting him, in the name of the King of Italy, with an Italian order of merit.

THE Geological Survey of the Western States of America, for which Congress has voted a sum of 10,000 dollars, promises to yield the most interesting and important results, more particularly, as it is asserted, in reference to the Evolution Theory, which we are informed will derive special

support and conclusive elucidation from some of the facts now first ascertained. The examination of the great plains between the Mississippi and the Rocky Mountains has revealed the existence of a chain of ancient lakes of great extent, the shores of which had teemed with an abundant and varied flora and fauna. In the lower strata were found traces of colossal hippopotami, and bones of Titanotherium, an extinct pachyderm larger than the elephant. Thousands of Chelonidae of all sizes were found mixed with the bones of many extinct forms of Cervus and Ape, while the remains of five distinct species of rhinoceros, of mastodons, camels, horses, elephants, beavers, &c., afford conclusive proof of the inapplicability of the term "New" in designating the American continent, which may probably claim a higher antiquity than the so-called older Eastern world.

It may be adduced as a proof of the success with which some recent efforts of the French Society of Acclimatisation have been attended, that kangaroos are being made objects of "le sport" in France. This Australian immigrant appears to take kindly to French soil, and several country gentlemen on whose estates the animals had been introduced have been able to indulge in the recreations of a kangaroo hunt. The larger species is still too costly for this purpose, as a couple can scarcely be procured for less than 80*l.*; but the smaller kind, of which the Société d'Acclimatisation at Paris has lately imported twenty pairs, may be bought for about 10*l.*

THE excitement caused by the sudden and mysterious death of so many of the most valuable animals in the Berlin Zoological Gardens continues unabated. A week ago it was found that a male and female jaguar, two black panthers, two lions, and a lynx, were suffering from some virulent poison, and although prompt measures were resorted to, only two of the animals were rescued, and even these—the male jaguar and female panther—are not considered to be out of danger. It had been conjectured, when first this strange mortality set in, that the raw horse-flesh on which the animals had been fed might have been diseased; but as the meat has since then been carefully examined, and cooked before it was given to them, this conjecture was obviously inaccurate, and under the idea that the animals had been maliciously poisoned, a reward of 1000 thalers has been offered by the authorities for information which may lead to the conviction of the offender.

PROFESSOR VAN EEDEN publishes, in the *Flora Batava*, a figure of a species of earth-star (*Geaster triplex*)—a most singular genus of fungi—which was first described from Java, but which he finds in abundance on the slopes of wooded dunes in Holland, particularly in the neighbourhood of Haarlem.

A stone bearing a Greek inscription, found in 1866 in the neighbourhood of Antibes (Antipolis), has been the subject of various studies. The inscription, which appears to belong to the fifth century B.C. at latest, is quite legible:—

Τέρπων εἰμι θεῶς θεράπων σεμνῆς Ἀφροδίτης
τοῖς δὲ καταστήσας Κύπρις χίριν ἀνταποδοῖν—

which may be translated, "I am Terpon, servant of the divine Aphrodite: may Cyprus recompense those who have consecrated this." It has been generally considered that the stone had been originally attached to some statue of a priest of Aphrodite named Terpon; but M. Heuzay, in a recent *mémoire* on the subject, read before the Académie des Inscriptions (illustrated by drawings and a plaster cast), points out that there is no trace of the stone having been attached, and that its material, a beautiful but hard green serpentine, a stone of great rarity, was not likely to recommend it for such a purpose. He considers it to be one of those sacred stones to which the ancients attributed supernatural virtues, and regarded them even as images of the gods. Aphrodite was herself adored in Cyprus under the figure of a conical

stone; and Eros or Cupid, according to Pausanias, at Thespiae, under the form of a rough natural stone. The stone of Antibes he believes therefore to represent Eros, called by Plato (*Symposium*), in the very words of the inscription, Ἀφροδίτης θεράπων; and the god himself is the speaker in the first line. Terpon is probably a local name of Eros, akin to the other participial names of deities in -ων, e.g., Ἀπόλλων (Phœbus), Πλούτων (Hades), Ὑπερίων (Helios), Τρίτων, &c.

M. ERNEST HAVET has just published in a fuller form a paper read by him in September, 1873, before the Académie des Inscriptions, upon the date of the writings ascribed to Berosus and Manetho. He endeavours to show that there is no reason to attribute to the Berosus of Vitruvius, Seneca, and Pliny the fragments preserved by Eusebius; that the work attributed to Alexander Polyhistor, from which Eusebius quotes, is not authentic, although it apparently also supplied Josephus with his quotations from Berosus; but that this work, as well as the recital of Manetho, cited by no one before Josephus, belongs to a date much more recent than that claimed. He has pointed out very serious difficulties in the received opinions as to the authenticity of the *Βαβυλωνιακά* and *Αἰγυπτιακά*, and made it impossible henceforth to appeal to the authority of Berosus and Manetho, which seems hitherto to have been implicitly accepted, without a full discussion of their value.

A HITHERTO unprinted MS. of the "Historie van Sent Reinolt," in the Lower Rhenish dialect of the fourteenth and fifteenth centuries, is printed by A. Reifferscheid in the last number of the *Zeitschrift für Deutsche Philologie*. The MS., a paper one, of the first half of the fifteenth century, formerly belonged to the philologist, E. von Groote, of Cologne, and was left by him to the archives of his native town. It is evidently a carefully written copy of an older MS., and is valuable as a memorial of old Low German prose, as well as carrying the inquirer still nearer to the sources of the German and Dutch popular story of the Heimons-kinder, Reinolt being the youngest of the four sons of Heimo and his wife Aia, sister of Charlemagne. Among its peculiarities is that of forming a diphthong or "fracture" of the original long vowels, though of a different kind from the diphthongs that have been developed from the Anglo-Saxon long vowels, viz. by adding *i* or *e*, reminding us of the Yorkshire *moonin*, *sooin*, and the middle Scotch *rots*, *buik*, *deir*, &c. Thus we find *jair*, *maige*, *groiss*, *hoe*, *zoich*, *moisten*, *goid*, *goed*, *geinc*, *stelt*, *uis*, *huis* for *jahr*, *mage*, *grose*, *hut*, *zog*, *mussten*, *gut*, *ging*, *stelt*, *aus*, *haus*. It is to be regretted that the German mania for "systematising" the spelling of their old MSS. shows no sign of abatement. The editor cannot even give us this interesting document without supplying it all through with accents to show the (supposed) long vowels, and without most unwarrantable liberties with the consonants, such as changing double letters into single, putting *k* for *ck*, *z* for *tz*, *j* for *y*, *i* for *y*, *u* for *v*, and *v* for *u*, so that the old *tzyden*, *yonge*, *ymbtrynt*, *keyker*, *craft*, *werck*, become transformed into *ziden*, *jonge*, *umbtrint*, *keiser*, *craft*, *werk*. We have many things to learn from German philologists; but they have yet to learn from us the first rudiments of common sense in printing MSS., viz. to give us the spelling as they find it, without cooking it in the manner at present so unhappily in vogue. What right has any editor to conclude that because a vowel was long or short in Moeso-Gothic or Sanskrit, it continued to be so in fifteenth century Platt Deutsch? If we followed such unscholarly methods in English, we should write blóód, móther, Whitsunday, primrose, criminal!

THE March number of the *Theologisch Tijdschrift* contains a *résumé* in French of M. Littré's *La Science au point de vue philosophique*, and several interesting reviews and critical notices. Mr. Berlage draws a pointed contrast between the critical stagnation and assumption of infallibility

evidenced in Ewald's recent work on the three first Gospels and the Acts, and Scholten's candid recantation of his opinion that the Acts of the Apostles are by the author of the third Gospel. We hope soon to have something more to say about the latter work, which is calculated to raise the already high reputation of its acute author. Professor Tiele expresses a favourable opinion of the *Sketch of Indian Religion*, brought out by one of the masters at the Missionary College at Basle, and a criticism of the second volume of Spiegel's *Iranische Alterthumskunde*. He is not disposed to deny that Semitic ideas may have exercised an influence on the formation and development of Iranian religion; indeed, he thinks it rather probable than not, but wishes for more definite and cogent arguments.

DR. TISCHENDORF has brought out another "editio minor" of his Greek Testament. It contains brief Latin Prolegomena, expounding his canons of criticism, his views on the New Testament dialect, and the history of the printed text, and followed by a short account of the MSS., and other critical helps. The text is that of his "editio octava major," for a criticism of which see ACADEMY, vol. iii. pp. 83, 89. At the foot of each page there is a collation of the "received text," and of codices *κ* and *B*.

WE trust that the German papers have been misinformed in regard to the statement to which they have given currency, that the authorities of the Vatican Library have not allowed the learned Hebraist, Dr. Davidson, to obtain any nearer view of the Codex used by Tischendorf, than could be obtained by looking at it through a locked glass case.

THE celebrations at Leipzig, on the evening of March 4, of the Jubilee held in honour of Dr. Fleischer's fiftieth year of academic activity, were the occasion of bringing together a large number of German and French Oriental scholars, many of whom had in past times owed their training to him. A sum of money was raised among those present, to be added to the collections at present being made by his old pupils and literary collaborators, for the foundation of a Fleischer Fund, to aid students of Oriental languages; and the celebration ended with the usual amount of laudatory speechifying, in which, however, just tribute was paid to the merit, which no one acquainted with Dr. Fleischer's literary and academic career will deny to him, that he has made for himself many friends but no enemies.

A DUTCH publishing firm invites subscriptions to what will undoubtedly prove a work of great interest to the scientific student of language. It is a *Dictionary of the Dutch Frequentatives*, by Dr. A. de Jager, one of the oldest and most zealous students of the Netherlandish tongue. Years ago the same author published a treatise of some bulk on what he then termed "the verbs of repetition and continuity."

MR. T. R. DRIVER, Fellow of New College, Oxford, has in the press a short treatise on the nature and use of the Hebrew tenses. It aims at supplying a want commonly felt by students of Hebrew, to whom the sudden change from the precision of the classical languages to the apparent arbitrariness of the Hebrew usage is very embarrassing.

DR. FRANZ DELITZSCH sends us "a specimen from the school of Fleischer," his "teacher and friend," a translation of a poem of Samauel, the (pre-Mohammedan) Jewish-Arabic poet, from the Hamasa, with the scholia of Tebrizi (pp. 40; Leipzig: Dörffling and Franke). The translation of the latter will be of great service to those just beginning the Hamasa (and what Arabic student does not long to do so at the earliest possible moment?), as also will the interesting historical introduction.

At the meeting of the Philological Society on Friday last, the honorary membership reserved by

the society for distinguished foreign philologists, which has already been bestowed upon such names as Lassen, Littré, Biondelli, Hettema, Madvig, Mätzner, Bekker, and Ritschl, was conferred upon M. Paul Meyer in recognition of his eminent services to philology. The merits of M. Meyer were summarized in a brief *mémoire* by Mr. Henry Nicol.

THE German Empire possesses twenty Universities. Prussia has nine: Berlin, Bonn, Breslau, Göttingen, Greifswald, Halle, Kiel, Königsberg, Marburg; Bavaria has three: Munich, Erlangen, Würzburg; Baden two, Heidelberg and Freiburg; Saxony one, Leipzig; Württemberg one, Tübingen; Hesse one, Giessen; the Saxon Duchies one, Jena; Mecklenburg one, Rostock; Alsace one, Strassburg. Leipzig has the largest number of students, Kiel the smallest. Strassburg, by the number of its students, has risen to the eleventh place among the German universities.

WE are glad that the wants of M. Paul Meyer's class at the Ecole des Chartes have induced him to publish the first Part of his *Recueil d'Anciens Textes, Bas-Latins, Provençaux et Français*, in advance, without the twelve or eighteen months' delay that the preparation of the Glossaries, Notes, and Indexes would have involved. This present Part I. extends from the ninth century to 1538, and contains an admirably selected succession of specimens from Low-Latin and Provençal documents, and these largely manuscript ones. For the first time in any Provençal or Old French chrestomathy, M. Paul Meyer has most wisely introduced Low-Latin. No sharp line can be drawn between the decline of that "language"—are we to call it?—and the rise of Provençal or Old French; and therefore Low-Latin is as necessary an opening for a set of specimens of Old French as what the Germans call New Anglo-Saxon, and we Semi-Saxon or Transition-English, is for a set of specimens of Early English. Dr. Richard Morris has persuaded the Delegates of the Clarendon Press of this latter fact, and, for his second edition, is extending his original series of "Specimens" up to the twelfth century. M. Paul Meyer starts his first edition with Low-Latin of the ninth century, and gives twenty-one samples of various periods of the tongue. He then passes to Provençal, which he begins with a bit of "Boèce" from the MS. *Bibl. d'Orléans*, No. 374:

"Nos jore omne, quandius que nos estam,
De gran folia per folledat parlam: "

and gives altogether sixty-three extracts, many of great interest from their illustrations of laws, manners and customs, down to A.D. 1538. The second is from our British Museum (Harleian MS. 2928), and here is a verse of it, St. John xiii. 4:

Sarrit a coena, et pontit vestimenta sua; et cum acciperet linteum, praecepit se.

L'ava de la cœna, e pânso sos vestinens; e cum ac prisa la toale, preceis s'en.

The last, of 1538, is an "Hordenanso" or Ordinance of the Syndics and Councillors of La Cadière, fixing the fines for non-attendance at the council:—

"tos en bon acordi et union, an hordinat et fach ordenanso entre elos, que cant dengun manquera au consel ho en la cort, que devon pagar come s'en siecee

Et primo, los sindigues en consel, gros .ij. pp home.

Item mais, los sindigues en la cart. g. .iiij. . rr home.

Item mais, los conseliers, cont no seran en consel ho en autre part, come es agut hordenat . . . g. j. per home."

MEETINGS OF SOCIETIES.

LONDON AND MIDDLESEX ARCHAEOLOGICAL SOCIETY. (March 9.)

DR. EDWARD SMITH, F.R.S., in the chair.—Mr. G. Lambert, F.S.A., exhibited and described three silver "loving cups," and a "peg" tankard, belonging to the reign of James II. Mr. F. Fellowes, F.S.S., offered some remarks upon the exhibition. Mr. Henry W. King, honorary member of the Society, read a paper on "Monumental Brasses"

in the church of Leigh, in Essex, to the memory, respectively, of Robert Salmon, Master of the Trinity House and Sheriff of London; of Captain Goodlad, also Master of the Trinity House in 1638, whose name is mentioned in Purchas's *Pilgrimage*, and who was likewise commander of the Greenland fleet for thirty years; also of Richard Chester, son of George Chester of Hartlepool, who was Master of the Trinity House in 1615, and died in 1632; also of Captain John Price, a distinguished naval officer, who resided in the parish of St. Clement Danes; and of members of the family of Haddock, several of whom were eminent in the same professions. Mr. J. Green Waller made some observations upon the costume as illustrated by the monuments, as well as on the general question of palimpsest brasses.

ROYAL GEOGRAPHICAL SOCIETY.

At the meeting of the above Society on Monday evening, the 9th instant, under the presidency of the Right Hon. Sir Bartle Frere, a paper was read by Mr. Hutchinson, H.M. Consul at Callao, on the railway which is being constructed from Lima, on the coast of Peru, to Oroya, in the valley of Xauxa. The line passes through a gorge of the Andes and winds through the ravine of Matucana, with lofty hills and mountains on either side. At S. Bartolomé, forty-two miles from the coast, the great difficulties of the undertaking commence. In two zigzags, five miles long, the line ascends 916 feet, while a viaduct of three spans, 550 feet long, conveys the line across the next ravine. At Piedra Parada the summit of the pass over the Andes is reached, at a height of 15,645 feet above the sea.

Mr. C. R. Markham, C.B., F.R.S., next read a paper on the railway which has been completed in southern Peru between the port of Mollendo, Arequipa and Puno, and on the steam navigation of Lake Titicaca. During the last three years and a half from 4,000 to 5,000 labourers from Chili and Bolivia have been employed in constructing the line between Arequipa and Puno, a distance of 217 miles. This opening up of the resources of the interior is greatly due to the energy of Don Manuel Pardo, the President, and to Captain Melgar of the Peruvian Navy.

In the discussion which followed, Senor Don Pedro Galvez, the Peruvian Minister, who spoke in French, expressed his great gratification at the interest displayed here in scientific undertakings in distant countries, and assured the meeting of the earnest wish of the Peruvian Government to open up the country, develop its resources and invite colonization.

Colonel Church pointed out that the railway across the Andes would reach the head waters of the Amazon, and thus form a chain of communication between the Pacific and Atlantic Oceans, while in the valleys drained by the upper waters of the Amazon there existed great natural wealth. The United States were shortly to send an expedition up the last-named river to explore as far as the mouth of the Madeira, while an auxiliary expedition would start from Arequipa and examine the head of the Madeira river.

Mr. Keith and Sir Harry Verney both drew attention to the rich mineral wealth of Peru; and Mr. Markham concluded by detailing the geographical attainments of Don Manuel Pardo, the President of Peru, who was shortly to be proposed by the Council of the Royal Geographical Society for election as a corresponding member.

CHEMICAL SOCIETY (March 5).

PROFESSOR G. C. FOSTER in the chair.—A paper, "On the Spontaneous Combustion of Charcoal," was read by the author, Mr. A. F. Hargreaves, in which he pointed out the best wood for charcoal for the manufacture of gunpowder, and also the best method of charring it. It appears that if it is ground too soon after being burnt, the charcoal is liable to take fire spontaneously. Other papers followed.

ZOOLOGICAL SOCIETY (March 3).

DR. E. HAMILTON, V.P., in the chair.—The Secretary read a report on the additions made to the Society's Menagerie during February, and called special attention to a Malayan Hornbill (*Buceros Malayanus*), new to the Society's collection; a Python, presented by Mr. C. J. Noble, of Hong-Kong; and a young male of an undescribed species of deer from Northern China. Letters and communications were read—from Sir H. Barkly, announcing that he had obtained a pair of young Eared Seals (*Otaria pusilla*) for the Society's collection;—from Mr. W. H. Hudson, of Buenos Ayres, on the parasitical habits of the three species of *Molothrus*, found in Buenos Ayres, namely, *M. Bonariensis*, *M. badius*, and *M. rufo-axillaris*;—by Mr. Slater on a small collection of Birds, obtained by Sir G. Briggs in the island of Barbadoes, West Indies, and on an apparently new form of the family Icteridae, which he proposed to call *Centropus mirus*;—from Dr. J. E. Gray, on *Crocodylus Johnsonii*, Krefft, from Northern Australia, of which he proposed to form a new genus, Phylas;—by Mr. W. S. Kent, on a huge Cephalopod or Cuttle-fish, announced by the Rev. M. Harvey as lately encountered in Conception Bay, Newfoundland, and of which a tentacle sixteen feet long has been secured for the St. John's Museum. Mr. S. Kent contributed the additional evidence of an arm nine feet long preserved in the British Museum, in proof of the gigantic dimensions occasionally attained by certain members of this order of the Mollusca, and proposed to institute the new generic title of *Megaloteuthis* for their especial reception; he further suggested distinguishing the Newfoundland example as *Megaloteuthis Harveyi*.

FINE ART.

Leonardo da Vinci and his Works, consisting of a Life of Leonardo da Vinci by Mrs. Charles W. Heaton, an Essay on his Scientific and Literary Works by Charles Christopher Black, M.A., and an Account of his most important Paintings. (London: Macmillan & Co.)

MRS. HEATON has written the life of Leonardo; Mr. Black an essay on Leonardo's scientific and literary works; Arsène Houssaye's *Histoire de Léonard de Vinci* furnishes a list of seventy-seven of the master's paintings; and the labour of three persons thus yields a stately volume, remarkable alike for copious illustration, luxurious typography, and splendid binding. It is characteristic that a book which treats of the greatest artist of any age should contain no opinions as to the genuineness of the pictures assigned to him; equally characteristic that Mrs. Heaton should disclaim both the purpose of writing a complete life and the intention of criticising pictorial works. The truth appears to be that no one in our day possesses the concentrated power which is required to depict Leonardo as a man, an artist, and a philosopher; and we cannot say that Mrs. Heaton makes a confession of weakness when she declines a task which no one hitherto has even attempted. To her the catalogue of M. Arsène Houssaye must have been a warning; she knows enough to be aware that Leonardo never painted seventy-seven pictures; and she displays a true instinct in leaving to Mr. Houssaye the responsibility for his own lucubrations. Her industry is sufficiently shown in the production of a sketch embodying almost all that recent research has brought together in the shape of new materials for the life of Da Vinci; and it cannot be expected that in

the compass of this sketch she should go deeper than she has done into the causes of Leonardo's greatness, or the circumstances under which he acted in various periods of an active career.

It has been said, and we find it repeated here, that Leonardo was the most unintelligible of all the artists of his time. He is described as having very soon outstripped all the teaching that Florence could bestow, yet he is admitted to have been minute and slow in execution. It is considered strange that he should have escaped the searching eye for talent of Lorenzo the Magnificent, yet it is confessed that he had made no position for himself up to the time when he was twenty-eight years old. There is some difficulty in attempting to reconcile these conflicting statements, which, if we should accept them as true, would indeed go far to make Leonardo unintelligible. But are they true? In more than one respect Leonardo contrasts with Raphael and Titian, in nothing more than in this, that whereas Raphael and Titian were independent masters at twenty, he only acquired this position at twenty-eight or thirty. He was born in 1452, and passed for his guild in 1472; but he was an assistant under Verrocchio till 1478 at least. Raphael and Titian had no ambition in life but that of being painters. Their education was made by painters. Leonardo was bred in the school of a goldsmith, who was at the same time a sculptor, a painter, and a musician. The gifts which surprise Da Vinci's biographers he acquired from Verrocchio, and the time which he spent in acquiring them was no doubt considerable; but this need not create surprise if we admit that one art is less difficult to master than three. Under no circumstance can we even then affirm that Da Vinci outstripped all the teaching that Florence could bestow; for at the outset he was not anywhere near approaching to the mature perfection of Ghirlandaio, Botticelli, Filippino, or Pollaiuolo; and it is not a cause for wonder or speculation that a young man who had such rivals to contend against should not have acquired the protection of Lorenzo de' Medici.

The slowness of Leonardo's execution may be admitted in so far as we assent to the statement that he spent years in finishing certain statues and pictures; but his greatest masterpiece was confessedly executed in a short space of time; and there is no valid reason for believing that he was slower than others. He created little for the same cause that Verrocchio created little. He neglected the easel occasionally for the chisel or the pen, putting it aside to make drawings, produce architectural and physical models, form clay, carve statues, solve mathematical problems, and mature systems of fortification. Mrs. Heaton laments the loss of all Leonardo's early works, and she considers it a legend that he should have painted an angel in the Baptism of Christ executed by Verrocchio for the convent of San Salvi. She has an unaccountable contempt for Verrocchio. Yet he was a great master, whose pictures, as described by Albertini, were thought worthy of being placed side by side with those of Ghirlandaio and Filippino in the public palace of Florence; and the same

Albertini writes—let us mark the date—in 1510, not that he thought, but that he knew, that Da Vinci painted the angel at San Salvi.

Of more importance than any other in the career of Leonardo is the question respecting the date of the master's departure from Florence to seek his fortune in Lombardy. The draft of a paper in which Leonardo describes to Lodovico Sforza the vast extent of his acquirements, is accepted by Mrs. Heaton as a letter addressed from a distance to a stranger. There are passages in that draft which show that it was not a letter, but a memorandum recapitulating certain offers made in a previous interview; and there is a direct allusion in it to the bronze horse that was to be raised as a monument to the glory of Francesco Sforza. The idea of erecting an equestrian statue to this chieftain was probably suggested by the success of the competition for models of a statue of the same kind in honour of Bartolomeo Colleoni at Venice. The Council of Venice first began to move in this matter in the summer of 1479; and Fabri, a German traveller, mentions three models by competing artists as being exhibited in different churches of Venice in 1483. At this time no steps had been taken to procure the cast of any of them; but it was known that a prize had been voted to one of the competitors, that is, to Verrocchio. It is not unlikely that, after the Venetian Government had decided in favour of a Florentine sculptor, Lodovico Moro conceived the idea of raising an equestrian statue of his father in one of the squares of Milan. He might have given the commission to a Milanese; but he wanted a masterpiece, and he sent for tenders to the Tuscan capital. Amongst the persons to whom he applied, the most prominent was Antonio Pollaiuolo, who produced a model and two sketches which Vasari describes. Antonio, however, was much employed by the Medici; Lorenzo the Magnificent was desirous of sending him to Rome. The negotiation with Lodovico for this and for other reasons failed. Then it was, perhaps, that Leonardo conceived the idea of competing, communicated his plan to the Lombard Duke, and set out for Milan. He doubtless had interviews with Lodovico during which he urged what he could do if he were taken into the Duke's service; and then we may believe he penned the memorandum which appears as a draft in the *Codex Atlanticus*. We are further than ever now from knowing when this draft was written; but it is fair to assume that Leonardo was still in Tuscany in 1480-1. On April 23, 1490, Leonardo wrote in one of his books that he had on that day "recommended the horse." The questions which this sentence suggests are numerous. Did Leonardo begin a new design, a new model, or a new casting? We should throw a slight on the master's genius if we supposed that he had not solved the difficulties of design and model long before 1490. When asked for a model of the drum of the Milan Cathedral he made it and kept to it; and it was long preserved without ever being used. The same thing must have happened in respect of the horse. It may help us in this uncertainty to recall what Vasari says in the Life

of Giuliano da San Gallo of the employment of that architect by Lodovico Moro at Milan. Lodovico wanted a palace built, and he applied to Lorenzo de' Medici. Lorenzo sent him San Gallo, who, Vasari says, began the palace, conferred with Leonardo as to the casting of the horse, and gave his countryman some valuable hints; yet, adds Vasari, neither horse nor palace were ever perfected, and the model of the former was afterwards destroyed. Is it presumptuous to urge that Leonardo tried to cast the horse, failed, and in 1490 tried again? His model was exhibited on a triumphal arch at Milan in 1493; it was stored in a lumber-room in 1501; it perished at some subsequent period. During the troubled times which preceded the fall of Lodovico, the poets of Lombardy were all alive to the importance of making it imperishable. "Fluat Aes" was the motto of Leonardo and his friends; but, when bronze was forthcoming, it was wanted for cannon and mortars; and in this way the masterpiece of Da Vinci was allowed to decay, and was ultimately lost to posterity.

After Leonardo's departure from Milan in 1500 he withdrew to Florence, where he made a short stay. His fame was now great; his labours and travels became more multifarious than ever, and his movements were watched and recorded with considerable interest. Still, there are intervals in which we lose sight of him altogether; and this casual disappearance of the hero suggests theories that are not always reconcilable with truth. Mrs. Heaton believes that Da Vinci went, in 1503, or the beginning of 1504, to Rome. She thinks it probable that during his stay there at this time "he executed the much disputed Virgin and Child with the donor of the cloister of St. Onophrius." Certain proof is attainable that Leonardo was at Florence on November 21, 1503. On February 28 following, the scaffoldings for his cartoon were finished in the Pope's Hall at Santa Maria Novella; and it is clear that the negotiations for the production of this great work must have been carried on during the very time when the artist is supposed to have been away. The cartoon itself was begun on April 1. Again, Mrs. Heaton suggests that Leonardo and Michael Angelo were engaged simultaneously in the production of cartoons; and she adds that the rival works were finally laid before the Signory, and publicly exhibited at the end of 1506. The truth is, that Leonardo began his cartoon six months before Michael Angelo. He finished his work on February 28, 1505, and began to transfer the design to the wall of the public palace immediately after. No public exhibition of the cartoons was made till long after this, and Michael Angelo's design was jealously concealed from every one as late as July, 1508.

Mr. Black had as complicated a task to perform as Mrs. Heaton; but more had been done by men of letters to elucidate Da Vinci's diaries, than by critics to throw light on his plastic and pictorial works; and in so far Mr. Black was fortunately situated. He performs his task ably and pleasantly; and we cannot, on a cursory view, do more than take exception to the opening passages of his essay as throwing an artificial obscurity over the

background upon which the figure of Leonardo is relieved. Leonardo is truly described as an innovator; but there is much exaggeration in such remarks as these, that "in whatever direction he turned his mind's eye, Leonardo discerned paths which must lead to great discoveries, but choked up, long untravelled, and with few or no guides to direct the traveller,"—or that "Leonardo triumphed in the contemplation of the darkness on which he felt destined to direct the light of truth." Students of the time immediately preceding the age of Da Vinci will recollect that men existed at Florence who had travelled much and to some purpose in the paths which Leonardo afterwards so thoroughly explored; and it is only necessary to mention Brunelleschi, Donatello, Leon Battista Alberti, Francesco di Giorgio, and Lorenzo della Volpaia.

J. A. CROWE.

NOTES AND NEWS.

THE Second Part of the *Reports respecting Factories for the Spinning and Weaving of Textile Fabrics Abroad*, which has lately been published as a Blue Book, relates principally to the United States. The lengthy particulars given in it about the hours of labour, the rates of wages, the progressive production of cotton and woollen manufactures, &c., will be found invaluable to the student of political economy, but do not furnish much matter of general interest. From the memorial of the silk manufacturers presented to Congress in 1872, which is here quoted, we gather that the most recently-developed textile art in the States is the manufacture of silk. The production of the raw material was pursued in the colonies before the middle of the last century, with such success that "Queen Caroline wore in 1735 a robe of Georgia silk, and the Governor of Connecticut appeared in 1747 in a coat and stockings of home production;" but this culture was quite effaced by the Revolution. The stimulus which this branch of industry has received during the past ten years seems almost incredible. Thus write these sturdy protectionists:—

"What may we not attain at the end of the next decade if free-trade delusions do not prevail? France and England make their silk fabrics principally for exportation. We have an unlimited market at home. Where one woman in France wears a silk dress, there are fifty in America. The Roman emperor, Aurelian, would not permit his wife to have a silk dress, because it was too great a luxury even for an empress. The wife of every American workman not only wishes, but wills to have one."

Articles of male attire manufactured at home do not, however, seem to be quite so much thought of, for another writer says:—

"Go into a fashionable tailoring establishment here, and the proprietor tells you that he does not keep American goods at all, that there are no goods fit to be worn made in this country, and he would not have them in his shop."

AMONG some valuable modern paintings sold at the Hôtel Drouot, on Tuesday week, were four scenes from the Forest of Fontainebleau, by Diaz de la Pena: *The Spring*, 6,750 fr.; *The Pool*, 3,750 fr.; *The Glade*, 4,000 fr.; *Evening*, 1,810 fr.

M. LEMAÎTRE's collection of old masters, to which we referred last week, was sold at the Hôtel Drouot on the 5th instant. Among the most important paintings sold were:—*La Noce de Village*, Jan van Steen, 15,600 fr.; *Jéus chassant les Vendeurs du Temple*, Jan van Steen, 6,100 fr.; *Le Saint-Nicolas*, Jan van Steen, 6,100 fr.; *L'Oiseau envolé*, Van Tol, 2,020 fr.; *Animaux à l'Abreuvoir*, Verdussen, 1,500 fr.; *Port de Mer*, Weeninx, 1,280 fr.; *Scène galante*, Weeninx, 1,360 fr.; *Sainte*

Famille, Van der Werf, 1,020 fr.; *Halte de Chasse*, Wynants and Lingelbach, 9,250 fr.; *Les Apprêts du Repas*, Zorg, 2,560 fr.; *La Vierge, l'Enfant Jésus et Saint Jean*, Puligo, 6,000 fr.; *Portrait d'une Grande Dame de la Cour de Louis XIV. et de sa Fille*, Nattier, 1,430 fr.; *Le Petit Voleur de Pâté*, artist unknown, 3,200 fr.

THE entire stock of Turner's engravings having been ordered by the Court of Chancery to be sold, the sale of the fourth portion was concluded last week, having occupied four days, at Messrs. Christie, Manson, and Wood's auction rooms. It comprised *Ancient Carthage: the Embarkation of Regulus*, engraved by D. Wilson, 1840. Eight artist's proofs fetched from 11*l.* to 12*l.* 10*s.* each; 38 proofs on India paper, from 2*l.* to 2*l.* 10*s.* each. The *Ancient Italy*, engraved by Willmore. Four artist's proofs realized from 9*l.* to 13*l.* each. The *Modern Italy*, engraved by W. Müller, 1840. The artist's proof of this sold for 13*l.* 10*s.*, and 44 India proofs before letters went at from 2*l.* to 2*l.* 18*s.* *Heidelberg*, engraved by T. A. Prior, 1846. Several unfinished proofs brought from 8*l.* to 12*l.* each, and 42 artist's proofs on India paper, from 3*l.* to 5*l.* each. *Venice*, engraved by W. Müller, 1837. A touched proof, 8*l.* 5*s.*; 40 proofs before letters, from 2*l.* to 6*l.* 15*s.* each. *Mercury and Adonis*, engraved by Willmore. The trial proof of this sold for 12*l.*, and no less than 50 proofs before letters fetched from 6*l.* to 10*l.* each. Besides these there were a great number of impressions of the *Field of Waterloo*, engraved by Lewis; *The Deluge*, engraved by Quillet; *Fishing Boats off Calais*, engraved by Davison; and *Boccaccio: the Birdcage*, engraved by Quillet.

THE large collection of his water-colour drawings left at his death by Mr. D. H. McKewan, of the Institute, was sold at Christie's on the two last days of last week. It counted no fewer than three hundred and seventy-eight works, many of which were avowedly sketches, and most of which had been produced with rapidity. The more finished—if that is a word that may be used of them at all—of the outdoor subjects realised prices varying, say, from ten to twenty guineas each. The interiors, in which Mr. McKewan excelled—but which were also swiftly done and which have nothing whatever in common with the rarer, more elaborate, not necessarily happier productions of some of our famous living water-colour men—went for higher prices, as it was right they should do. These works, the product exclusively of the artist's later years, were sold, some at eighteen or twenty, some at thirty guineas a piece. Many of our readers will remember the effects they reproduced with any amount of *chic*, and perhaps a little genius—sunlight streaming on an oaken floor at Hardwick; tapestried walls in shadow at Cotehele; the faded velvets and panelled chambers at Knole.

THE sale of the paintings of M. Joseph Fau is advertised for the 9th of this month. It consists of a most remarkable collection of portraits of the French school of the eighteenth century, of Nattier, Largillière, Rigaud, Van Loo, Mignard, &c. Among those of Largillière, of whom there are six paintings, is an important and splendid portrait of a lady, which, for freshness and brilliancy of colouring, may be classed among his best works. There is also a remarkable portrait of the Duchess of Portsmouth by Pierre Mignard, dated 1682, and one of Mademoiselle Victoire, daughter of Louis XV., represented by Nattier as Diana, superb portraits of Anne of Austria and of Louis XIV.; and a gentleman of the court of Louis XV. by Van Loo.

A NEW edition of Doré and Jerrold's *London* is announced. It will be published in monthly parts by Messrs. Grant and Co.

THE Council of the Royal Academy is composed this year of Messrs. Armitage, Cooke, Cousins, Dobson, Faed, Herbert, Horsley, Lewis, Millais, Stocks, Street, and Ward. Of these Messrs.

Armitage, Herbert, Horsley, and Ward are selected as the Managing Committee.

It is said the two Scotch landscapes by Millais, which every one is looking forward to see in May at the Academy, are already sold for 6,000*l.*

THE *Times* states that probably the finest collection of ancient lace ever made has been lent for the forthcoming International Exhibition by M. Dupont, of Paris. The specimens will be arranged in chronological order, and will thus exemplify the origin and growth of the art of lace-making. There are upwards of 300 examples, some of which have a historical interest as belonging formerly to various sovereigns, among others Louis XV., Marie Antoinette, and Napoleon I. We are not aware, nor does the *Times* state, whether M. Dupont is a dealer: but his lace does not, we believe, pass through the French Commission.

THE Duke of Brunswick, in his last will and testament, charged his executors to raise a monument to him at Geneva, and indicated that he wished it to be designed somewhat after the pattern of the Scaligers' monument at Verona. The poor executors are in great perplexity on this subject, for the Scaligers' monument having been designed especially for the place in which it was erected, cannot be made to accord with the sites offered by the city of Geneva for this purpose. In this dilemma the executors have had recourse to the celebrated French architect, M. Viollet le Duc, who has undertaken to go to Geneva and deliver his verdict on the suitability of the proposed sites. M. Viollet le Duc is known in Switzerland by his effective restoration of the cathedral of Lausanne.

M. DE CHENNEVIERES has addressed a Report to the Minister of Public Instruction, in which he points out that though France has had a splendid array of artists for the last forty years, of which she may well be proud, their energies have been spent on isolated and fragmentary works, and the "Direction des Beaux-Arts" has failed in doing its part of encouraging such great undertakings as might concentrate the genius and the labours of French artists. He proposes, therefore, instead of squandering the resources of the Fine Arts Budget on a number of scattered works, to devote a considerable portion of it for several years to the decoration of the interior of Sainte-Geneviève with "a vast poem of painting and sculpture;" and thereby to prove that French artists are able to rise to the heights of religious and patriotic art, as the Opera-house has shown them to excel in the softer gifts of grace and elegance.

WE learn from Greece that the Communal Council of Pylos has decided to erect on the square of that town the statues of the three admirals who commanded the allied fleets during the memorable battle of Navarino.

THE *Times'* correspondent quotes from the evidence of Count Palikao before the Commission now investigating the claims put forward on behalf of the late Emperor, an interesting account of the Summer Palace at Peking. It was a vast parallelogram, of which the longer sides are about a league in length, with fortifications, and including fifteen or twenty palaces and pavilions, each one of these having a different use. One was full of silks, the produce of a tax which requires every manufacturer to send in the first piece he makes of each sort. A part of these were used instead of ropes, which were wanting, to picket the French horses. Then there was a palace full of drawings, a series of 4,000, illustrating the whole history of China. The soldiers, ignorant of their value, trod them under foot and used them as firing. Scarcely two hundred were saved; fourteen of these are in General Montauban's possession. Then there was the carriage palace, in which were found some magnificent coaches presented to the Emperor of China by an English embassy in 1818. Since then they had never been used. The ironwork

was loose, and the leathers had become as hard and brittle as wood. One palace was full of furs.

THE *Portfolio* announces that in compliance with the wish of many of its subscribers, it has been determined to offer proof impressions of the etchings that have appeared in it singly, so that they may be framed or placed in collections. Lovers of etching will no doubt avail themselves of this opportunity for acquiring several most excellent examples of the art. Two or three of those announced we see are from the Wilson catalogue. The success of the *Portfolio* is gratifying, not only because it is so well merited, but also as an indication that there is a growing knowledge and a taste for really good art in this country. Some years ago such a publication would have met with but little appreciation. The March number contains a fine etching, by C. Waltner, of Rembrandt's portrait of himself as a young man, in the National Gallery (No. 672); a short sketch of Rembrandt by R. N. Wornum accompanies the etching. Basil Champneys takes us to Rye, as before to Winchelsea; W. B. Scott reviews Mrs. Bury Palliser's translation of Jacquemart's *Ceramic Art*; and Hamerton continues the "Sylvan Year," illustrated in this number by two small etchings by Lançon. Besides these we have a large and severe etching, by W. Wise, of a girl's head, drawn in black and white by F. Leighton.

VOLUME xliii., part 2, of the *Archæologia* is taken up chiefly with "Notes on Excavations in Rome during the Winter of 1868-69," by Mr. J. H. Parker; and some elaborate papers by Dr. Thurnam "On Ancient British Barrows, especially those of Wiltshire and the adjoining Counties." With regard to the latter, we may say that it is impossible to convey any notion, within the limits of a short notice, of such a very extended review of British sepulchral antiquities; it forms a most valuable contribution to an inquiry into the origin, affinities, primeval conditions, and manners of our remote ancestors. Dr. Thurnam thus sums up the results of his investigations:—

"That two widely-differing races had occupied this island prior to the invasion of Julius was often before surmised, and is now, we think, proved; but that the first of these two races in time was long-headed and of short stature, and the later and more civilised round-headed and tall, could only have become known to us by an adequate examination of the barrows, and the study of the human remains found in them."

A further illustration of the same subject appears in vol. xliv., part 1, issued simultaneously with the above, by Mr. T. W. Snagge, whose paper on "Ancient Oak Coffins discovered near Featherstone Castle, Northumberland," is well worth perusal. Other articles in the last-named volume are "Observations on the Probable Sites of the Jewish Temple, and Antonia and the Acra," by Mr. Thomas Lewin; "Observations on the hitherto unnoticed Expedition of the Emperor Augustus into Britain," by the late Mr. W. H. Black; "A Description of the Chapel of Saint Erasmus in Westminster Abbey," by Mr. J. T. Micklewaite. A remarkable and interesting document connected with the English occupation of Paris at the time when King Henry the Fifth was recognised as the heir of his father-in-law, Charles the Sixth, is here printed with illustrative remarks by the late Mr. J. Gough Nichols; it is the original appointment of Sir John Fastolf to be Keeper of the Bastille of St. Anthony at Paris in 1421. We think, however, that the paper by Mr. James Fowler, "On Mediaeval Representations of the Months and Seasons," will attract most attention. In the Middle Ages, it would seem, representations of the months and seasons were of frequent occurrence, whether in illuminated manuscripts, early printed books, clogg almanacs, cut stone, carved wood, metal-work, encaustic tiles, mosaics, wall-paintings, or painted glass. For each month, the custom was to represent the corresponding sign of the Zodiac, or some characteristic symbol or occupation, or both, with or with-

out the name of the month or other inscription. The seasons were usually represented by symbols or occupations only. Mr. Fowler has taken one or two specimens from each of the forms in which these illustrations appear, and has enriched them by quaint selections from early writers.

THE Loan Exhibition of pictures and works of Art which is being organised for the coming spring by Count d'Haussonville and Baron Taylor, and is to be held on the ground-floor at the Palais de la Présidence du Corps Législatif, seems likely to be very successful. Several chambers of the Présidence, and the gallery of Count de Morny, are being so arranged as to bring together all the works lent by the same owner. A whole room will be devoted to the magnificent collection of the Duc d'Aumale; and the Rothschild family, Princess Mathilde, the Duchess de Galliera, the Princess de Sagan, the Countess Duchâtel, Sir Richard Wallace, MM. de Gressulhe, André, and others will contribute collections of works of art never yet publicly exhibited, which will be separately arranged. A peculiar feature of the Exhibition will be a collection of the historical portraits scattered over the country in private hands; so that we shall see marshalled before us illustrations of their times by Philippe de Champaigne, Rigaud, Largillière, the Van Loos, Greuze, Madame Vigée-Lebrun, and all the great portrait-painters of the French school. The indefatigable promoters of the Exhibition intend also to apply for loans to various provincial museums, some of which are rich in works of art. The profit on the fees paid for admission will be devoted to the benefit of the inhabitants of Alsace and Lorraine.

THE Crozatier prize for workers in metal is this year to be awarded for ornamentation only, birds being included under that head.

THE French Committee for the admission of paintings to the London International Exhibition of the present year has finished its labours under the presidency of M. du Sommerard. The works of sculptors, architects, and engravers will be examined immediately.

MANY French artists were becoming alarmed at not receiving the medals awarded to them by the Jury of the Vienna Exhibition. Their anxiety has, however, been allayed by an official intimation that owing to the great number of the medals they will not be ready before July.

THE *Gazette des Beaux-Arts* contains so much that is interesting this month, that it is difficult to give a *résumé* of its contents in the space of a note.

1. "A propos d'un Dessin de Michel-Ange," Emile Galichon makes known a few gracious words which prove that, however proud and obstinate Michael Angelo may have shown himself when dealing with popes and princes, he was not above submitting his work to the judgment of a simple gentleman whom probably he recognised as a correct *connoisseur*. The words in question were addressed to Ser Tommaso di Cavalieri, the friend and pupil of Michael Angelo, and were written beneath a design for the Fall of Phaethon, sent to him for approval by Michael Angelo before he undertook a more finished drawing. He offers, if the sketch does not please Ser Tommaso, to make another ("Ser Tommaso, se questo schizzo non vi piace, ditelo a Urbino a cio ch'io abbi tempo da averne facto un altro . . . come vi promessi, e si vi piace e vogliate ch'io lo finisca . . ."); and it seems probable that he did really alter his design in accordance with Tommaso's suggestions, for the larger and more finished drawing of the same subject in the Windsor collection differs considerably from the one sent to Tommaso, now in the possession of Emile Galichon, and reproduced in facsimile with the writing underneath in the *Gazette*.

2. Charles Blanc, in Article VII. of his "Grammaire des Arts décoratifs," considers the question of lace. It would not be necessary, he says, to

give instruction on the subject if ancient manners were still preserved, "car toutes les femmes d'autrefois se connaissaient en points."

3. An etching by Lalanze from a sketch in the Louvre of Van Dyck's charming portraits of the children of Charles I., of which the finished painting is at Windsor.

4. The English engraver, Hills, whose works are but little known even in England, and are "absolutely unknown in France," is the subject of an appreciative notice by P. Senneville. Several illustrations from Hills' studies of deer are given, and more of his animal drawings are promised in another number.

5. M. G. Demay continues his learned disquisition on "The Seals of the Middle Ages."

6 begins a series of articles on "Contemporary Landscapists," by Frederic Henriet. The first reviewed is Daubigny. The review is enriched by numerous illustrations from his works.

7. Various representations of Pallas Athene, especially after the type for this goddess was definitely fixed by Phidias, are enumerated by Louis Menard, who calls the divine virgin, "la plus parfaite expression du génie politique de la Grèce."

8. A short account, by René Menard, of the Palazzo del Te and Giulio Romano's frescoes.

9. Several very sad "Last Letters of Prud'hon" are communicated by Madame Eudoxe Marcille, to whom they were given by Madame Gnoyesser, the daughter for whose benefit the exhibition of Prud'hon's works at the Ecole des Beaux-Arts has been organised. The letters are mostly addressed to this beloved daughter, and are full of affection, but a hopeless melancholy seems to have possession of their writer's soul. In one of the last he writes: "Tout ici est néant pour moi, et je ronger secrètement le frein de ma mélancolie sans chercher même à me distraire de ma tristesse."

THE *Débats* states that the *Archives of French Art*, founded, in 1851, by M. de Chennevières, and continued by M. A. de Montaiglon, after an interval of some years, has now reappeared, under the title of *New Archives of French Art: a collection of inedited documents published by the Society for the History of French Art* (Paris: J. Baur). The first volume contains, besides a great number of documents relating to French artists from the thirteenth to the nineteenth century, the list of artists and artisans employed on the decoration and repair of the royal castles from 1605 to 1656; the list of the painters, sculptors, architects, engravers, and other artists belonging to the household of the king, queen, and princes of the blood during the sixteenth, seventeenth, and eighteenth centuries; an inventory of the reliquaries of Anne of Austria; and several very important pages on the part played by David during the French Revolution.

A SINGULAR robbery is announced from Grindelwald. The bell, which bears the date of 1044, and the inscription "O S. Petrela [Petronella], ora pro nobis," has disappeared from the parish church.

A MEETING of Her Majesty's Commissioners for the Vienna Universal Exhibition of 1873 was held at Marlborough House, on Wednesday, March 11, under the presidency of his Royal Highness the Prince of Wales, K.G. There were also present: his Grace the Duke of Richmond, K.G., Lord President of the Council, the Right Hon. Hugh C. E. Childers, M.P., Sir Anthony de Rothschild, Bart., Sir Richard Wallace, Bart., M.P., and Mr. P. Cunliffe Owen, secretary.

IN a sitting of the Chamber of Deputies, February 27, Signor Minghetti, Minister of Finance, proposed the sale of several public buildings to the municipalities of the different towns in which they are situated. Among the most important of these sales is that of the Palazzo Riccardi at Florence, the stately residence of Cosmo "Pater Patriae," and inhabited by the Medici family until the end of the seventeenth century. This

palace, celebrated for the majestic severity of its architecture, is a noble specimen of the Florentine fortress style. Within, the galleries are richly decorated, the ceilings by Luca Giordano. Here the Academy Della Crusca held its sittings, and compiled its Dictionary. The Government, in selling the palace, retain the rooms containing the Riccardi library, and stipulate that the paintings of Luca Giordano and the frescoes of Benozzo Gozzoli, which adorn the chapel, shall be carefully preserved, and free access to them given to the public.

THE STAGE.

MADEMOISELLE DESCLÉE.

It is hardly true to write that death has deprived the stage of Mademoiselle Aimée Desclée, for a mortal malady deprived it only too surely and enduringly of her presence from the time when it first became apparent. Mdle. Desclée died last Monday morning, and in literary, artistic, and theatrical society in France her death has been the chief thing of the week.

Few French actresses—certainly hardly any of equal fame—are so well known to the cultivated public of London as was the distinguished *comédienne* who is now gone. She came to us last summer with an immense fame—a fame, it may be said, even in excess of her merits, or at least requiring to be made more precise and definite than common English rumour had made it—and the English public was conquered by her at once. The morning after her first performance her name was in everyone's mouth. Only for half an hour had the public wavered—and that delay was due to her own nervousness, her own unnatural and unwonted quietness at the beginning—but after that half-hour, during which we believe Mdle. Desclée herself was expecting that she should fail before the best audience London could show, the conquest was complete. It became the fashionable amusement of the season to go and see her in *Frou-Frou* and *Diane de Lys*; she was accounted as attractive as Patti or Marimon; and English audiences sat surprised, as at the spectacle of some new thing, while that marvellously subtle play “constrained” them, like the glittering eye of the Ancient Mariner, to listen to its tale.

It seemed a singularly restless and unhappy art—that art of Desclée. One associates with it little of tenderness, little of sweetness, nothing of repose, nothing of contentment. There was stillness enough, but it was felt to be but the pause that precedes passion. And the feelings to which the artist gave most forcible expression were feelings now of bitter remorse, now of unavailing but subdued regret, now of breathless anxiety, now of strong contempt, and now of cynical indifference. She had not lived much in Paris, until the last years of her life, but one felt that the women she represented knew all the worst side of the life of a capital, and that their pity for human weakness was not so much pity as supreme contempt. She herself, in her gaiety as well as in her sadness, satisfied completely the Parisian ideal, and as the liveliness of her *Frou-Frou* was deemed sufficient in Paris, one shrinks from insisting on the opinion which nevertheless the present writer did, last summer, advance in this journal, that not only was her pathos sometimes wanting in truth, but her vivacity wanting in heartiness. Probably Paris was right and we ourselves not wrong. Probably health had begun to fail when she played *Frou-Frou* in London. With no freshness of youth—with an entire absence of animal spirits—what boots it even to be mistress of immense resources of art? And there was about her, now and then, in London last summer, a peculiar and restrained pathos which made its mark. In *Frou-Frou* her great death scene was surely lacking in visible tenderness, but there was a power about that broken utterance, a certain spell which one does not forget, as of one who in last minutes, numbered already, could not

remember to be tender—could but deliver, as it were, a message, of which the importance was the one thought remaining in the mind.

The general success of Mdle. Desclée was a slow success. Scribe wrote of her, when she was at the Conservatoire, that she would be “a good *amoureuse*; excellent for the Gymnase;” and the Gymnase tried her, and she failed. She wandered afterwards in many towns; was not very successful at the Vaudeville; went to Turin with no supporting repute; played and was recognised more fully in Russia; was engaged in Brussels, at the Galeries Saint-Hubert. In the last place the younger Dumas saw her in his *Diane de Lys*, and thence in 1869 she came to Paris to play in a succession of pieces from his pen. It would be difficult to over-state that which during the next two or three years she did for him and for the Gymnase Theatre. Meilhac and Halévy and M. Léon Laya also stood indebted to her; but they wrote good pieces, and she made Dumas's pieces good. This last at all events is true of *Une Visite de Noces*, a fruit of stage liberty under the Republic, which even a very reasonable Lord Chamberlain might decline to sanction in England, but which the present writer, who saw it at the Gymnase in October, 1871, can attest to have been made by Desclée's acting not only enduring but exceedingly effective.

She is dead, at the age of thirty-seven. Her widest fame came to her when she was no longer able to greatly care for it, and whatever sadness was in her life, in her thought, her ways—a little dreamy, a little *mélancolique*—there is more in the early end which cut short a career that might have had its best in the future, and deprived the stage of a great artist, valued too late, and gone too soon.

“LADY CLANCARTY.”

MR. TOM TAYLOR must have written the first act of *Lady Clancarty* to show how very dull a clever man can be. One sits and listens, and listens and waits; one hears much and remembers nothing. There troop before one's eyes the familiar figures of romantic drama; there are the dark conspirators hatching treason in a country inn; there are the belated travellers; the fair women who are in danger of rough usage; and now here is the valiant fellow who will come to the rescue—the stage has known these characters for many a year. One feels most wearily that one has seen them all before. In their day they were welcome enough, but is their day never to be done? Coming, like the *Rolla* of Alfred de Musset, “so late,” into “so old a world,” are we still to be confronted with these time-worn stage worthies—the traditional embodiments of venturesome vice, and yet more venturesome virtue—and are we finally to accept them in the place of individual studies from Nature and the life? While they are a prodigious time—as it is only the second night—in bringing on the furniture and arranging the scenes for the second act, one asks one's self this question; and if one were discussing the work of a novelist, not playwright, the answer would be plain—we have had enough of these lay figures of history and romance, who tell us nothing we do not know before: in the work of a novelist who would be considered an artist there is no place for them any more. They condemn the man who introduces them. But speaking of a playwright, one remembers after all that the circumstances are different; and while one would be grateful for the absence of these traditional and colourless impersonations of persecuted beauty and manly valour, and for the presence, in the place of them, of some new interesting study of the individualities of living men and women, one admits that the playwright has certain difficulties in this matter which are not so much felt by the novelist. The novelist in his own person can narrate. He can pass at will from chronicle to dialogue—from dialogue to chronicle. But the dramatist is in fetters. He has not even

got the aid of a chorus. His characters must speak for themselves. They, in their talk, must unfold much of the story—at all events, as much of the situation as is needed for us to understand the subsequent action of the piece. By the principal characters, who have as a rule been the objects of the author's serious study, this is rarely done; and as, at court, the approach and presence of a monarch are announced, now by this herald, now by that, so on the stage it is the duty of certain minor characters to put us all *au courant* with the situation—to announce to us, ere they arrive, the hero, the heroine—one knows not what other principal personages, upon whose fortunes we are to concentrate our interest. Now it very often happens that the individuality of these minor characters is neglected; and such excuse as there may be for it we have pointed out.

The second act drags a little; but not so much as the first; and in good time one begins to understand how it was that the few people who had heard the drama, or seen it during rehearsal, had made excellent report of it to those with whom they spoke. One begins to forget that dull inn in Romney Marsh, with its dull comic landlady, and then its scenes of danger and rescue—stirring scenes which never quite stirred us after all—one begins to realise, at length, that here, in Lord Portland's cabinet, the dramatist has found a dramatic situation worthy of good treatment, and that he is treating it in a manner worthy of his own better work. Here now are scenes which fine acting could make very effective—which poor acting could not entirely spoil. And here Mr. Henry Neville's opportunities are great, and are on the whole well used. There is not much subtlety about him, as Lady Clancarty's husband speaking to her when she—married to him in childhood, and in childhood divided from him—does not know what he knows—that she is his wife. Nay, more; we think that once or twice Mr. Neville's manner is such as to rouse suspicions in her mind. The gladness is too great for a friend's gladness; surely it is the husband, not the husband's comrade, who is thus expressing the husband's joy, one would say. But Lady Clancarty does not suspect it, and no discovery is prematurely made. Perhaps the special characteristics of Mr. Henry Neville's acting have better room for their display in the next act, where Clancarty (implicated in the Jacobite conspiracy), takes refuge in his wife's bedchamber, while she still thinks him not her husband, but her husband's friend. Here he declares himself, and then ensues one of those scenes of impetuous pleading, of earnest, rapid declamation, which one associates with the presence of Mr. Henry Neville, and which, when wanting in subtlety, are never wanting in manliness. This scene is full of excellent situations; situations which are no more new than the famous situations in *The Lady of Lyons*—so much beloved of all legitimate actors—are new, but which are continually effective, and which commend themselves to the players because they allow of the rapid, unceasing presentation of all sorts of strong emotions; love, pity, horror, abnegation, revenge—one knows not how many forms of entreaty and endearment, how many attitudes of bliss, surprise, and terror.

The fourth act is not so effective. Its interest is broken up by the intrusion of other themes than the main theme. “Scum Goodman,” the tell-tale among the conspirators, is hardly used before our eyes by the fellow-adventurers towards whom he has been treacherous. But at last we get back to the royal presence, in which the remaining cards of the great game are played out, and the curtain falls upon a pardon which Clancarty has certainly earned, and upon a happiness which is not bestowed upon his faithful wife too soon.

Nothing short of a long sketch of a somewhat complicated and involved plot—which we shall not attempt—would enable the reader, who does not see the piece, to quite understand the

ingenuity which Mr. Tom Taylor has bestowed upon details of construction. And though the groundwork of the play is historical—to be found, as the play-bill tells us and all the world remembers, in Macaulay's *History*—the ingenuity is entirely his own, for he has connected Lord Clancarty (the story of whose child marriage and long separation from his wife is also historical) with the Assassination Plot of 1696, and he has woven into the tale a hundred aids to stage intrigue: he has contrived many and many an excellent plausible pretext for mystifying the characters chiefly concerned, and for delaying the *dénouement*. This must all be taken for granted: it cannot be gone into in detail. The reader takes our word for it, and one has only to regret that so much dexterity of manipulation should in this case be unaccompanied by any exercise of the literary power which gives higher intellectual and artistic interest to a work than any it can derive either from constructive ingenuity or historical association. It is very possible that one does not want upon the modern stage long speeches, however eloquent, or a profound and subtle analysis which the gallery and the *bourgeois* Upper Boxes wouldn't understand, and of which the after-dinner chatters in the private boxes would speedily grow weary. But one does still want, and from a writer of Mr. Tom Taylor's power and position one has a right to expect, a little beauty, a little wit: something to remember, something to carry away. And we do not think that all the theatrical experience, all the knowledge of stage expedients, all the fertility of resource, all the firmness of handling, shown in the second and third acts of the new drama can quite atone for the weight of weariness that presses upon one during the first. At the same time it should not fail to be noticed that the ingenuity is more than mechanical ingenuity; the beginning of love with which Mr. Taylor invests Lady Clancarty for the *soi-disant* Captain Heseltine—really her husband—is a well-conceived and well-considered touch.

We have spoken of Mr. Henry Neville, whose part is the most prominent. Next to him comes Miss Ada Cavendish, who works earnestly as Lady Clancarty. There is a good deal to praise in her performance: a good deal of quiet grace and natural refinement; some gentleness; a touch of tenderness even, where tenderness is needed; and almost always an amount of intelligence sufficient to save her from fatal fault. But here and there—at a given climax—desiring to be forcible she becomes artificial. In moments that ought to be the strongest—at all events in moments that she means to be her strongest—one cannot associate her tones and measured utterance with the emotion she would fain convey. The lapse is peculiar, for up to a given moment she has seemed to be feeling her part and living in it; then suddenly, when the feeling should be most intense—the sympathy most vivid—the artist and the character fused most completely into one—there is a phrase pronounced in stilted accents, a look that is not the look of emotion, but the mere stage-symbol of it, and, as far as we are concerned, the illusion is gone. But this thing does not happen very often (it should never happen at all), and it would not only be ungracious—it would be unjust—to deny to Miss Cavendish the possession of gifts and acquirements which entitle her to a good position. She is a graceful actress of high comedy; her imaginative power only begins to fail her when she ventures on the representation of high passion—to which, alas! not three actresses in a generation ever appear to be adequate. Miss Emily Fowler acts a certain Lady Betty Noel with no new phase of dramatic ability which we may add to those displayed very pleasantly in *The School for Intrigue*; but the part is not so good as report said it was, and Miss Fowler makes as much of it as she well can. Her lover is played rather heavily by Mr. Walter Fisher.

The best acting in this piece is that of Mr. Anson and Mr. Charles Neville. Mr. W. H. Vernon, as

the heartless brother of Lady Clancarty, impresses us on the whole with stolidity rather than deep-seated heartlessness; but there is one touch, when he thrusts his sister from him in the bedchamber, that appeals to you at once by its reality—a certain indefinable truth of tone supporting the gesture. You feel he has disposed of a bad business to his satisfaction; there is an end, for a time, of his sister's importunity. That is well done. But, on the whole, the best acting is that of Mr. Anson and Mr. Charles Neville. Mr. Anson's expression during the struggle in the Gatehouse Yard, when the men whom Goodman has betrayed crowd round to do him violence, realises uncommonly well the coward's nature, the ugly and abject terror, the moral as well as physical helplessness—a loathsome being clings round his protector—it is something less manly than Caliban. The expression is horrible, but it is excellently found and done; its force is force of the mind, and not of caricature. A quieter virtue marks the performance of Mr. Charles Neville as William III. He is "made up" excellently. He is restrained, subdued, full of *sang froid*: he has some quiet dignity which is not of the body. Yes, one says, this is an aid to the imagination—this presentation of Dutch William; it helps instead of destroying. One is nearer to William than one has been before; the interval does not seem so great; the time is not so remote. You sympathise with him, whether you will or no—this spare, worn man, with intriguing Ministers, with Mary in her grave, with little but his own sagacity to trust to, and with these asthma-fits stopping his sentences—where did Mr. Neville learn them so well?—reminding you in some slight way of the peculiar interest you take always in the weary fight waged between a strong will and the gathering forces of Death.

FREDERICK WEDMORE.

Ready-Money Mortiboy—a play adapted, as the fashion now is, from a novel which has been read a good deal, and which has a name as curiosity-exciting as the "Z. Marcas," which Balzac always counted among his happiest inspirations—was produced at the Court Theatre on Thursday night, too late for lengthy notice here. It is the work of Mr. Walter Maurice and James Rice, and two of the principal parts are played by Mr. George Rignold and Miss Litton.

LATE in the evening, at the Queen's Theatre—when the *Wandering Heir* is done—they play a little drama called *Rachel the Reaper*, in which Miss Rose Evans, who was heard of in the country some few years ago, makes what, if we mistake not, is a first appearance in London; at least in any prominent part and prominent theatre.

MISS NELLY POWER, who has been acting at the Surrey Theatre since Boxing night, took a benefit there on Wednesday evening, when there was a concert in addition to the performance of *Rough and Ready* and of the very popular pantomime in which Miss Power takes part.

THEY continue to play Mr. Wills's *Mary Queen of Scots* at the Princess's, where a new actor, whose family is not unknown in literary society, now acts the part of Chastelard.

MR. BARRY SULLIVAN, the tragic actor, is playing at Nottingham, and will next week be at Bristol.

MISS FURTADO and Mr. J. Clarke have just been acting at Brighton.

A FEW nights ago there was a most discreditable, and, let us have the justice to add, a most unusual disturbance at the Alhambra Theatre. It was during the performance of Mr. Byron's burlesque. Miss Kate Santley was assailed with hisses directly she appeared, and she had speedily to withdraw from the stage. The act apparently was that of somebody else's partisans; certainly not that of the general audience, for the audience insisted upon having her back, and back she came,

and acted and sang quite as well, we are told, as any one under such circumstances could be expected to do.

THE *School for Scandal* yet again, and at another theatre! It was played at the Gaiety on Saturday afternoon with a strong cast, though not a complete one.

AFTER Easter we are promised something brilliant at the French theatre in London. Favart and others are said to be coming over.

THE Théâtre Français has its "Tuesday evenings," as private houses have their "Mondays," their "Wednesdays," and the like, and on these evenings Society gives rendezvous in the Rue Richelieu. This is a new thing, chiefly in vogue since the burning of the old Opera-house. A very special choice is made for the performance of these evenings, and on Tuesday in last week the choice fell on *Le Menteur* of Corneille, and *Le Mari à la Campagne*, by Bayard and Jules de Wailly. Molière was not chosen, and as Molière was not chosen, the critic of the *Débats*, whose business, as an accomplished writer of *feuilletons*, is to talk rather well of everything *not* in his brief, treats us to his view of the Don Juan of Molière, which, to say the truth, is given in a neat bit of analysis. In Don Juan at twenty, without restraint, without shame, says the critic, Molière saw the future Tartuffe: a man more dangerous than the Tartuffe we know: "Un libertin parvenu à l'âge de raison est tenu à plus de réserve. Pas d'éclat, pas d'étalage. Sa réputation d'homme à bonnes fortunes, dont il était autrefois si fier, le gêne et l'embarrasse. Ce qu'il lui faut désormais, c'est la réalité des choses, et non l'apparence:

'De l'amour sans scandale et du plaisir sans peur.'

MONSIEUR LEGOUVÉ put an old thing well the other day, when he said, in his lecture on Scribe, that Scribe "did not so much paint characters as trace the outlines of rôles for the stage."

THE Drama in China has come into serious collision with the constituted authorities, as witness the following curious proclamation which has been recently issued at Shanghai:—

"Whereas the literati of Shanghai, Chêng Kuei-yin and others, have petitioned, setting forth that on the foreign settlements the numerous theatres encourage dissipation, and lead to good people being contaminated by contact with the bad: and that in the case of the actor, Yang Yé-lin, his examination has brought to light proofs of a life of immorality. They, therefore, pray that he be severely dealt with, and that a proclamation be issued, ordering all heads of families to control their female members and not allow them to enter the theatres. On receipt of this petition, it becomes the duty of the police magistrate to request the Mixed Court magistrate to issue a prohibitory notice to the above effect; and be it hereby known to all people of this town that the heads of families are ordered to restrict their women and prohibit them from attending the theatres, in order that the morality of the place be not injured.—Let each one tremblingly obey."

Theatrical matters must have come to a very bad pass to require such an arbitrary edict as the foregoing, but we hope—though not without considerable doubt—that it may have the effect of purifying the Chinese stage.

MUSIC.

CRYSTAL PALACE CONCERTS—BEETHOVEN'S "EGMONT."

THE music which Beethoven composed for Goethe's *Egmont* is so seldom heard in its entirety, that its presentation at last Saturday's Concert at the Crystal Palace was an event of considerable interest. It is somewhat more than five years since the work was last given at these concerts; nor has it, so far as we are aware, been since performed in London. An opportunity of once more hearing it was therefore

especially welcome. It consists in all of an overture, four entr'actes, two songs, a short interlude depicting Clara's death, the music accompanying Egmont's vision in the last act, and the concluding "Sieges-symphonie," which is merely a repetition of the last movement of the overture. The whole work, which was composed in the years 1809-1810, shortly after the quartett in E flat, and the great pianoforte concerto in the same key, is in Beethoven's best manner. The overture, a stock piece at our concerts, is too well known to need a word of mention; but the two songs (which on this occasion were charmingly rendered by Madame Otto-Alvsleben) are less frequently heard. The first, "Die Trommel gerühret," is of a martial character, and most exquisitely scored; the second, "Freudvoll und leidvoll," is an outburst of passionate tenderness, seldom surpassed even by Beethoven himself. Even more remarkable are some of the instrumental numbers. One of the finest of these is the second entr'acte, in E flat, depicting the warnings of William of Orange to Egmont, and the disregard of them by the latter. The menacing rhythm of the drums, to which so important a solo part is assigned in this movement, is one of the novelties of orchestration of which Beethoven was undoubtedly the inventor. More popular, though perhaps less striking, is the third entr'acte, the first portion of which is founded on the theme of Clara's second song, and which concludes with the pompous march, representing the entry of the Spanish troops into Brussels. The fourth, and last, entr'acte opens with a reminiscence of the second above referred to. It is here of deep dramatic significance. Egmont has just been made prisoner by the Duke of Alva, and too late he remembers the warnings of William of Orange. The introduction of the "warning" theme from the former movement, is therefore most felicitous. The *andante agitato* which follows, representing the vain endeavours of Clara to arouse the populace for the rescue of her lover, is of touching beauty—one can almost hear the appeals of the young girl in the pathetic phrases of the clarinet. The music depicting Clara's death, and that accompanying Egmont's dream previous to his execution, are both movements which lose somewhat of their effect in the concert-room. In the first volume of the late Moritz Hauptmann's letters to Hauser are some interesting remarks on this masterpiece of Beethoven's. Hauptmann says, "I don't know how others find it with this fine play, and Beethoven's fine music to it, but I, when the curtain falls, am not in the mood to hear such music, and when the entr'acte is over, I am again not in the mood to listen to dialogue. Just because both are excellent, and stand on an equally high elevation, neither will be subordinate to the other; but both cannot well be first, and as at the theatre the play is the principal thing, I should not dislike less important music for the entr'actes. I don't find it disturbs me to hear the same music, the same good old symphony-movements for quite different pieces, and do not care for specially composed overtures and entr'actes to plays, even if they are excellent, still less if they are poor."

The performance on Saturday was a most admirable one; but we cannot but think it was a mistake to intersperse between the movements fragments from the play itself, and a connecting narrative of the plot. This was read by Mr. Lin Rayne, an actor of known ability, but whose theatrical style of delivery, however excellent in itself, sounded strangely out of place in a concert-room. It was moreover superfluous, as it was all given in the book of words, and the audience could just as easily as at the recent performance of the *Midsummer Night's Dream* music have supplied the missing links for themselves. The interruptions of the music were rather a nuisance than otherwise.

A most important item of this concert was the first performance in England of Brahms's recently published orchestral "Variations on a Theme by Joseph Haydn." As we intend shortly to review the work, we shall not here enter into details. It is full

of novelty, both in the construction and instrumentation, and of no small difficulty. Too much praise can hardly be awarded to Mr. Manns and his orchestra for the remarkable excellence with which the work was rendered. There are some passages of such complexity, that under no circumstances would they sound perfectly intelligible. These are but the exceptions, and the general impression produced by the piece is clear enough. Had the composer been present, he would have had no reason to complain either of the execution of his music, or of the coldness of its reception. The remainder of the programme included a florid but uninteresting song from Winter's *Interrupted Sacrifice*, brilliantly sung by Madame Otto-Alvsleben, two songs by Mr. Santley, and the overture to *William Tell*.
EBENEZER PROUT.

At the last Monday Popular Concert, Herr Joachim was again the attraction of the evening. Each fresh hearing of this great artist only confirms the opinion expressed on the occasion of his first appearance this season, that he is playing, if possible, more finely than ever. Nothing can be imagined more highly finished, both technically and artistically, than his performance last Monday of the "Chaconne" (unaccompanied) from Bach's solo sonatas; it can only be compared with his rendering of the same composer's sonata in G minor, noticed in these columns a few weeks ago. In reply to a tumultuous encore, the great artist returned to the platform, and played another movement from the same collection.

Beethoven's great quintett in C, Op. 29, for strings, a work familiar to the frequenters of the Monday Popular Concerts, but always acceptable, was superbly rendered by Messrs. Joachim, Ries, Zerbini, Burnett, and Piatti; as also was the concluding piece of the evening—Haydn's graceful quartett in E flat, Op. 64, No. 2, by the same gentlemen, with the exception of Mr. Burnett. The pianist was Miss Agnes Zimmermann, who took no part in the concerted music, and chose for her solo performance, instead of a sonata, two pieces by Mendelssohn—the fugue in D from the "Seven Characteristic Pieces," and the prelude and fugue in B flat, No. 6 of the "Six Preludes and Fugues, Op. 35." Miss Antoinette Sterling, who contributed the vocal music, was ill-advised in choosing the "Cradle Song" from Bach's "Christmas Oratorio." The comparative failure of effect resulted not from any incompetence on the part of the singer, but from the fact that the sustained accompaniments to the song cannot be properly reproduced on the piano. The piece ought never to be attempted without an orchestra. In the smaller songs by Schubert, Schumann, and Mendelssohn, Miss Sterling left nothing to be desired.

AUGUST HORN, well known for his excellent arrangements for the piano of classical works, has completed an opera, which is expected to be shortly performed at Leipzig.

THE Chevalier Nigra, Italian plenipotentiary at Paris, has presented to the archives of the French Opera an interesting collection of printed documents and MSS. relating to the theatres and singing and dancing schools of Rome, Naples, Florence, Venice, Milan, Turin, Bologna, and Genoa. This collection, formed with great care, of regulations, statutes, and various official documents which are not for sale, and which therefore it is very difficult to procure, forms a very complete body of information as to the organisation of the great theatres of Italy, and is a kind of administrative history of the Opera in the country of its birth.

THE fourth concert of the British Orchestral Society took place on Thursday evening, at St. James's Hall, when the programme included the "Scotch" Symphony, the overture to *Die Zauberflöte*, Macfarren's overture to *St. John the Baptist*, a new (MS.) overture, entitled *The Witches' Frolic*, by

Mr. Henry Gadsby, and Spohr's "Dramatic" Concerto, played by Mr. Carrodus.

Of the very interesting fifth concert of the Wagner Society, which took place last evening, we shall speak in our next issue.

It may be worth while to remind those of our readers who are interested in modern German music, that the last of Mr. Coenen's excellent concerts takes place next Wednesday, when new compositions by Gernsheim, Bargiel, and Rubinstein will be produced.

THE prospectus of the New Philharmonic Concerts, which has just been issued, contains a large amount of attractive novelty. Among the works promised are Benedict's Symphony in G minor, Raff's symphony, "Im Walde," Lachner's Suite in E flat, Brahms's Serenade in D, Rudorff's overture to *Otto der Schütz*, Reinecke's "Friedensfeier" overture, a Concert-overture by Gustave Erlanger (composed for the society), Rietz's Concert-overture, Op. 7, Schumann's overture to *Julius Caesar*, Gottfried Linder's introduction to *Roswitha*, and selections from *Lohengrin*. Should all these promises be fulfilled, abundant opportunity will be afforded of making an acquaintance with the productions of modern talent.

BACH's great Mass in B minor was performed at Leipzig by the Riedel'sche Verein on the 6th inst. in the Thomaskirche—the church at which Bach himself was formerly musical director.

M. STRAKOSCH's operatic company are to bring out *Lohengrin* at New York, with the following cast:—Elsa, Madame Nilsson; Ortrud, Miss Cary; Lohengrin, Signor Campanini; Telramund, M. Maurel; King, Signor Nannetti.

THE appointment of Herr Sucher, as the successor to Herr Hellmesberger in the conductorship of the "Hofopertheater" at Vienna, which was mentioned in these columns a few weeks since as probable, is now announced in the *Signale*.

PROFESSOR STERN, the conductor of the celebrated choral Society at Berlin, named after him the "Stern'sche Gesangverein" having resigned his post through failing health, has been succeeded, according to the same authority, by Herr Julius Stockhausen.

F. BURGMÜLLER, well known as a composer of light literature for the piano, has lately died in France at the age of sixty-seven.

THE death is also announced of Louis Plaidy, for twenty-two years professor of the piano in the Leipzig Conservatoire. His *Technical Studies* are well-known to and highly valued by pianists.

THE "Academische Gesangverein" at Vienna gave on the 8th inst. a grand concert in aid of the funds for the erection of Wagner's new theatre at Bayreuth.

FROM Paris comes a statement that more than 15,000 copies have been sold of the score of Lecocq's popular operetta *La Fille de Madame Angot*.

A NEW operetta by Johann Strauss, entitled *Doctor Fledermaus* is in preparation at Vienna.

IN Antwerp a new Flemish opera by J. Merten, named *Thékla*, has been produced with success.

MR. CARL ROSA has decided upon founding a scholarship at the Royal Academy of Music in memory of his late wife, Madame Parepa-Rosa, which will bear her name.

MR. W. CHAPPELL has finished the first portion of his *History of Music*, except the index. It will not include Dr. Ginsburg's *History of Hebrew Music*, as it was at first intended to do.

MADEMOISELLE DESCLÉE was buried on Wednesday last at Père-la-Chaise. M. Montigny, Director of the Gymnase, pronounced an *éloge*, followed by M. Alexandre Dumas, whose remarks are reported in the *Pall Mall Gazette* of the 12th (Thursday).

SATURDAY, MARCH 21, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER and not to the EDITOR.

LITERATURE.

The Life and Labours of Albany Fonblanque.

Edited by his Nephew, Edward E. Barrington de Fonblanque. (Bentley, 1874.)

SOME forty years ago there were in existence two weekly newspapers, under new and vigorous management, which produced a marked effect on the age, and even made a new era in journalism. In 1828, Robert Rintoul, an honest and resolute Scotsman, had started the *Spectator*. In 1830 the *Examiner*, which had already established a character for honesty and courage, under the management of the brothers John and Leigh Hunt, fell into the hands of Albany Fonblanque as editor, and soon acquired a brilliant reputation through his ability and wit and never-failing tone of conscientiousness and high breeding. Both journals were highly-instructed advocates of progress, and largely and wholesomely influenced the great Reform movement which began with Lord Grey's government. "There is one thing," Lord Durham wrote to Fonblanque in 1836, "which I admire even more than your rare wit, your irresistible humour, and fine scholarship, and that is the thorough healthiness of your political views." *Healthy* was an appropriate epithet for both journals. There was difference between them: Rintoul had less ornament and more vehemence, Fonblanque less energy. Rintoul plied his political adversaries with an organ more resembling the battering-ram; Fonblanque's weapon was a sharp and polished rapier. Both were equally true friends of reform, and averse to revolution. The ability and high tone of both journals brought them in those days admirers and subscribers from the enemy's camp. When, in 1834, a plan was started by Fonblanque's political admirers for enabling him to acquire new machinery for the *Examiner* through subscriptions to the paper of ten years in advance, the present Prime Minister, then a Conservative aspirant for the House of Commons, begged permission to join in the scheme.

Albany Fonblanque was son of a distinguished Chancery lawyer, who had sat in Parliament for Camelford, and was a stout Liberal in days of undisputed Tory ascendancy. On the father's death, in 1838, Lord Lyndhurst wrote to his son, Albany: "I have known jurists as profound as your father, but I have known no one who was so perfect a master of the philosophy of the law." Albany Fonblanque was first designed for the Royal Engineers, and went to Woolwich at the age of fourteen to prepare for that profession; but a dangerous attack of illness compelled him to abandon his military studies. He found use in these studies, later in life, when, as editor of the *Examiner*, he criticised engineering operations in the Crimean war. "Once upon a time," he

then wrote to his friend and coadjutor, John Forster, "when beasts could speak, I was intended for the Engineers, and then I was obliged to study Vauban, Cohorn, and Léchât." When recovered from the long illness which took him from Woolwich, he became a pupil of Chitty, the eminent special pleader, with a view to being called to the bar. But he did not take to the law as a profession; his heart was in politics, and journalism his ambition. He always afterwards acknowledged the value to him in his journalistic profession of his early legal studies.

Fonblanque's father was an intimate friend of Jeremy Bentham, and Albany early became an admirer of the law-reforming sage. Through Bentham he became acquainted with James Mill, and he soon yielded himself, like many others of marked intellect, to that remarkable power of will and fascinating impressive conversation to which Grote has borne such powerful testimony, and which Grote to the last remembered with grateful reverence. An intimacy arose between Fonblanque and John Stuart Mill, James Mill's more celebrated son. John Mill worked zealously with Fonblanque in the *Examiner* for the Reform Bill and subsequent reforms. In 1835, the *London Review* was started, Sir William Molesworth being the proprietor, and John Mill the editor. There had come together in the House of Commons, in the first reformed Parliament, a small phalanx of Liberals more decided and advanced, and more instructed than the generality of Whig politicians—men who, as Mill describes them in his *Autobiography*, "thought themselves, and were called by their friends, the philosophic Radicals," and of whom, in the same work, he enumerates as the most notable, Grote, Roebuck, Sir William Molesworth, John (now Lord) Romilly, Edward Romilly, Henry Warburton, and Edward Strutt (now Lord Belper). With these men in practical politics Mill in the *London Review* cordially co-operated. But in his "philosophy" there were many things which none of these had dreamt of, and he is careful not to give them the name, which they acquired, of "philosophic Radicals." Mill thus describes his position in his *Autobiography*:—

"With a keen, and, as I now think, an exaggerated sense of the possibilities which were open to the Radicals if they made even ordinary exertion for their opinions, I laboured from this time [1832] till 1839, both by personal influence with some of them, and by writing, to put ideas into their heads and purpose into their hearts. I did some good with Charles Buller, and some with Sir William Molesworth, both of whom did valuable service, but were unhappily cut off almost in the beginning of their usefulness. . . . What I could do by writing, I did. During the year 1833 I continued writing in the *Examiner* with Fonblanque, who at that time was zealous in keeping up the fight for Radicalism against the Whig ministry. . . . But an opportunity soon offered by which, as it seemed, I might have it in my power to give more effectual aid, and at the same time stimulus to the 'philosophic Radical' party than I had done hitherto."

Here Mill gives an account of the origin of the *London Review*, founded by Molesworth, "himself a laborious student, and a precise and metaphysical speaker, capable of aiding the cause by his pen as well as by his

purse," and Molesworth made it a condition that Mill should be the real, if he could not be ostensible editor.

"In the years between 1834 and 1840, the conduct of this *Review* occupied the greater part of my spare time. In the beginning it did not, as a whole, by any means represent my opinions. I was under the necessity of conceding much to my inevitable associates. The *Review* was established to be the representative of the 'philosophic Radicals,' with most of whom I was now at issue on many essential points, and among whom I could not even claim to be the most important individual. My father's co-operation as a writer we all deemed indispensable, and he wrote largely in it until prevented by his last illness. The subjects of his articles, and the strength and decision with which his opinions were expressed in them, made the *Review* at first derive its tone and colouring from him much more than from any of the other writers. I could not exercise editorial control over his articles, and I was sometimes obliged to sacrifice to him portions of my own. The old *Westminster Review* doctrines, but little modified, thus formed the staple of the *Review*; but I hoped by the side of these to introduce other ideas and another tone, and to obtain for my own shade of opinion a fair representation, along with those of other members of the party. . . . In this I partially succeeded, though my relation to my father would have made it painful to me in any case, and impossible in a *Review* for which he wrote, to speak out my whole mind on the subject at this time."—(Mill's *Autobiography*, pp. 199-201.)

The death of Mill's father, in 1836, relieved him from much restraint, and he now gave free scope in the *London Review* to new opinions which he had formed, greatly softening the rigid utilitarianism of Bentham and his father, and combining with respect for Bentham a catholic admiration of Coleridge, Carlyle, John Sterling, and Frederick Maurice.

"Deprived of my father's aid, I was also exempted from the restraints and reticences by which that aid had been purchased. I did not feel that there was any other Radical writer or politician to whom I was bound to defer, further than consistent with my own opinions; and having the complete confidence of Molesworth, I resolved henceforth to give full scope to my own opinions and modes of thought, and to open the *Review* widely to all writers who were in sympathy with Progress as I understood it, even though I should lose by it the support of my former associates. Carlyle, consequently, became from this time a frequent writer in the *Review*; Sterling, soon after, an occasional one; and though each individual article continued to be the expression of the private sentiments of its writer, the general tone conformed in some tolerable degree to my opinions."—(*Autobiography*, p. 206).

We have made this long apparent digression for the purpose of explaining some letters of Mill to Fonblanque, of 1838, printed by Mr. E. B. de Fonblanque, which will provoke surprise and probably criticism, which, as they are printed, are not intelligible, and which Mr. E. B. de Fonblanque has himself greatly misunderstood. Fonblanque, who was then doing his best to defend Lord Melbourne's government against the Conservatives, had written to twit Mill with too much disposition to sympathise with Grote, Roebuck, and others in Parliament, whose tone towards the Whigs was less friendly, and had come to regard the Whig Government as hardly preferable to a Conservative one. Fonblanque had spoken of "the Grote conclave." Then Mill wrote

to Fonblanque, speaking of Grote and his parliamentary associates as—

“persons whom I have nothing to do with, and to whose opinions you are far more nearly allied than I am. There may be such a conclave, but I know nothing of it, for I have never been within the door of Grote's house in Eccleston Street, and have been for the last few years completely estranged from that household.”

And again, in another letter to Fonblanque, Mill wrote:—

“What is the meaning of your insisting upon identifying me with Grote and Roebuck and the rest? Do you in your conscience think that my opinions are at all like theirs? Have you forgotten what I am? how you once knew what my opinion of their philosophy is, and has for years been, more unfavourable by far than your own, and that my Radicalism is of a school the most remote from theirs at all points which exist? They knew this as long ago as 1829, since which time the variance has been growing wider and wider.”

All this is completely misunderstood by Mr. E. B. de Fonblanque, who even refers to the last-quoted letter as proof that “Mill and his followers had already, as early as 1829, begun to secede from the more extreme Radical section represented by Grote and Molesworth.” In 1829, Sir William Molesworth was yet a minor, and had not become a politician. Mill, in 1838, when he thus wrote of Grote and Roebuck, was not less a Radical than they: he blamed them at that time for lethargy in Parliament, and was more hopeful of the Whigs than they, but having Radicalism as an end in view. It is distinctly within the recollection of the writer that Grote, after the appearance of Mill's articles in the *London and Westminster Review* on Bentham (August 1838) and Coleridge (March 1840), everywhere disclaimed his sympathy with Mill's new philosophy as strongly as Mill had repudiated agreement with Grote. There is something unexpectedly strong in the tone of these letters to Fonblanque, written in private confidence. It is, however, clear that there was at that time unpleasant feeling towards Grote. Mrs. Grote's Life of her husband amply proves that this passed away, and that the old friendship returned, and remained till death separated them. Grote's review of Mill on Sir William Hamilton's *Philosophy*, written in 1866, reprinted by Professor Bain in Grote's *Minor Works*, is an elaborate and affectionate testimony by Grote of admiration for Mill, and also for his father, from both of whom some anonymous writers are now endeavouring to represent him as latterly estranged. Mill was one of few remembered by Grote in his will in the manner which indicates real respect and friendship. His widow begged and pressed Mill's attendance at the funeral of his life-long friend. There are those who have thought that the feeble and spiteful endeavours to separate Grote in memory from the Mills, and to elevate him by depreciation of those whom he loved to the last to speak of as his chief instructors, have had the object of giving pleasure to Grote's distinguished widow and biographer; but it is known to the writer, on the very next best authority to that of the lady herself, that, as might be expected, they have only given her pain. It does not appear to have occurred to these

writers that, in representing Grote as seduced and conquered by bad Mill influences, they have argued him a weak man. But Grote is as far above the clumsy flatteries as Mill above the ignoble carplings of flunkeys and fashion-hunters.

For seventeen years Fonblanque was editor of the *Examiner*. In 1847 he was appointed Statistical Secretary to the Board of Trade, in succession to Mr. G. R. Porter. He then relinquished the editorship, but he continued, by permission of his official superiors, to be a constant contributor to the paper, and he went on contributing till after 1860. His writings had a brilliant stamp of their own. The *Examiner*, under his management, belonged rather to literature than to journalism. His abundant wit and consummate polish of style were not more remarkable than his careful adherence to proprieties and truth and high sense of honour. He could justly pride himself on the fact that for thirty years and more of his connexion with the *Examiner* it was never even charged with libel. There is a passage in Moore's *Diary*, giving a vivid account of the state of the English press in 1831, shortly after the beginning of Fonblanque's editorship: it is a conversation with Moore of one of the most liberal and large-minded of statesmen, Lord Holland, who dwelt on

“the great misfortune of the total severance that had taken place between those who conducted the press and the better rank of society—even from literature it had become in a great measure separated, instead of forming, as in France, a distinguished branch of it. ‘Now you,’ Lord Holland said, addressing Moore, ‘and all the other eminent literary persons of this day keep as much aloof from the ‘gentlemen of the press’ as we of the political world do.’”—(Moore's *Diary*, vol. vi. p. 190.)

More Fonblanques than one were wanted to achieve the desired general reform. He maintained his own elevation and that of his journal by boldly avowing his *personality*, and by rigorously acting up to the responsibilities of a scholar and a gentleman. He did, in fact, attain and grasp in England the position of a high-toned French journalist. M. Van de Weyer introduced him on one occasion in Belgium as the Paul Louis Courier of England. His friend John Stuart Mill likened him to Armand Carrel. We conclude by quoting from a review written by Mill of Fonblanque's *England under Seven Administrations*—the cream of his *Examiner* writings from 1830 to 1837—a character of Fonblanque which Mr. E. B. de Fonblanque might advantageously have introduced into his Memoir.

“A man of whom it is saying little to say that he is *facile princeps* among English journalists, since it is doing infinitely too much honour to English journalists as a body to speak of him as belonging to their craft. Mr. Fonblanque is something far higher than a great journalist; he is a great writer, who happens accidentally to be a journalist. Of the innumerable newspaper-writers in this age of newspapers, his writings alone will take a place among English classics. In a generation whose bulkiest volumes are meant only for the day, his ephemeral productions, by the carefulness of their composition, and the lavish expenditure of mental resources upon their substance, might seem to be designed for immortality.”—(*London and Westminster Review*, April, 1837).

This description by a severe critic applies

equally to the extracts from the *Examiner* from 1837 to 1860, which make the bulk of this volume. The short Memoir—too short—prefixed by Mr. E. B. de Fonblanque is written in a tone highly creditable to a nephew.

W. D. CHRISTIE.

The Dramatic Works of Richard Brome. Three Volumes. (London: John Pearson, York Street, Covent Garden, 1873.)

In this age of exhaustive study and antiquarian scholarship, when every hole and corner of our literature is being ransacked for forgotten curiosities, perhaps there is sufficient reason for reprinting the fifteen comedies of Richard Brome in the three bulky volumes before us. The cock in the fable scratched up a pearl from the dunghill, and it is possible that some ingenious student may discover pearls in what is certainly the rubbish heap of Brome's plays. At any rate his tedious, laboured, and oftentimes offensive scenes, contain much information about the vulgar amusements of old London which we should otherwise have lacked. *The Sparagus Garden*, for example, shows that long before Cremorne, Vauxhall, and Ranelagh were places of public resort, folly and fashion played into the hands of avarice and imposition in semi-suburban arbours.

What Brome says of himself, in the Prologue to *The Love-sick Court*, is strictly true:—

“A little wit, less learning, no Poetry
This play-maker dares boast.”

He began life as a lackey to Ben Jonson; and after scraping some acquaintance with the method of manufacturing Jonsonian comedies, he set up as a dramatist on his own account. But his old calling clung to him. His view of the world is that of a groom, rather than of a gentleman; and the scenes and characters which he depicts are drawn from the experience of a flunkey. All the coarse and gross and seamy side of human life is shown to us with a prosaic ruthlessness. Against this we should have no real ground for objection, if Brome had been a satirist like Swift, a humourist like Mandeville, or even a poet with some portion of his master's fire. *Bartholomew Fair* is gross enough in all conscience; it has the grossness of obtuse sensibility and studied filth. But it is witty. You cannot help laughing at its dialogue; and the characters, once learned, will never be forgotten. Brome, on the contrary, is almost always dull; and vulgarity allied to dullness must rouse disgust and ennui.

That Richard Brome was not other than a favourite with his contemporaries may be gathered from the numerous appreciative copies of verses appended to his plays. As a playwright he enjoyed a reputation at least equal to his merit. His comedies, though tedious to read from their lack of poetry and life, may yet have been good acting plays. Our drama was then in its decrepitude; and the taste of the town, surfeited with a continual feast of nectared sweets, turned with gladness to novelties, however rank, so long as they were piquant. About Brome's life we know nothing; and it may be said in passing that this reprint of his plays does not pretend to furnish any biographical

notice. One or two little details might be gathered by a careful perusal of his prologues, epilogues, and testimonials in verse. We discover, for instance, that he formed a curious link of connexion between Ben Jonson and Thomas Dekker, whose warfare, carried on in the *Poetaster* and *Satiromastix*, was one of the smartest literary quarrels of the so-called Elizabethan period. While Brome was Jonson's servant, he was also, according to the phraseology of that day, Dekker's son. To my *Sonne Brome and his Lasse* is the title prefixed to some commendatory couplets by Dekker on the *Northern Lass* in 1632. To my old faithful *Servant* and (by his *contin'd vertue*) my *loving Friend*, is Jonson's dedication of a similar poem on the same occasion. The term *son* implied a friendly relation between an elder and a younger playwright, the latter deriving so much profit from the precepts of the former that he was, as it were, new-born in literature and art. Thus Jonson dubbed both Cartwright and Randolph sons; and it is possible that the old scandal of Davenant being Shakspeare's natural son is due to a misinterpretation of the same phrase. Brome's relation as manservant to Jonson was, however, by no means merely metaphorical; and to rare Ben he owed far more in the practice of his calling as a playwright than to the author of *Old Fortunatus*. Thomas Randolph, in his answer to Jonson's *Ode on Leaving the Stage*, alludes to the former relation between the two dramatists in these lines:—

"And let these things in plush,
Till they be taught to blush,
Like what they will, and more contented be
With what Brome swept from thee."

It would appear from this that the man had superseded the master in the favour of the public. Brome himself never ceased to profess that any mastery of the dramatic craft he might have gained, was due to the instruction he derived from Jonson. In the Epilogue to the *Court Beggar* we read:—

"This small poet vents none but his own, and his by whose care and directions this stage is governed, who has for many years, both in his father's days and since, directed poets to write and players to speak, till he trained up these youths here to what they are now."

Again, in the Prologue to *The City Wit*, Brome writes:—

"It was written when
It bore just judgment and the seal of Ben.
Some in this round may have both seen't and heard,
Ere I, that bear its title, wore a beard."

Jonson's method is discernible in all the comedies of Brome. The plots are firmly traced, and sustained on one plan throughout, with less appearance of improvisation than is common in the careless work of more gifted playwrights. The characters are defined with a coarse outline and a hard rigidity that betray the artifice of their construction. They are not persons, so much as tricks and humours, noted for their effective salience by the author, and invested with a semblance of individuality. Jonson's weakness was to mistake oddities of various complexion for characters, and to think that he had drawn a person to the life when he had clothed some peculiarity of manner in petticoat or jerkin. But his gigantic grasp, his force of style and fulness, the fervour of his

genius and the breadth of his humour, saved him, in his really finest work—*Volpone*, for example, and *The Alchemist*—from that barren unreality which is so tedious in Brome. Nothing but excellent acting could give animation to *The New Exchange*. A comedy which, in some respects, forms an exception to these remarks is *The Merry Beggars*. It has a novel plot. Springlove, the hero of the piece, had been taken in his childhood from a roving crew of vagabonds into the house of a country gentleman, who gave him a good education, and eventually made him his steward. The young man behaves himself in a most exemplary manner, except that always when the spring comes round, he feels the stirring of the wild blood in his veins, longs to shuffle off respectability, and betakes himself to the companionship of the next band of gipsies who pass the gates. His patron, Oldrents, reasons with him in vain:—

"Can there be found no means to preserve life
In thee, but wandering like a vagabond?
Does not the sun as comfortably shine
Upon my gardens as the opener fields?
Or on my fields as others more remote?
Are not my walks and greens as delectable
As the highways and commons? Are the shades
Of sycamore and bowers of eglantine
Less pleasing than of bramble or thorn hedges,
Or of my groves and thickets than wild woods?
Are not my fountain waters fresher than
The troubled streams, where every beast does
drink?
Do not the birds sing here as sweet and lively
As any other where? Is not thy bed more soft,
And rest more safe, than in a field or barn?
Is a full table, which is called thine own,
Less curious or wholesome than the scraps
From other trenchers, twice or thrice translated?"

He cannot by this prosy harangue extinguish what Springlove describes as

"This inborn strong desire of liberty
In that free course, which he detests as shameful."

As soon as the voice of the cuckoo is heard, and the beggars' camp appears, off he darts to join their crew. The "Scène de la Vie de Bohème," which introduces us to the merry beggars, forms a good finale to Act I. In the next act two pairs of lovers, fine gentlemen and ladies, who have been somewhat crossed in their respective affections by a judicious father, appear upon the stage. They want to work off the dulness of their country-house existence. Springlove's passion for the fields infects them. They resolve suddenly to join the crew. Then follows an amusing contrast between the real enjoyment which Springlove takes in the thieving, whining, begging life of the gipsies, and the affected satisfaction of the fine folk, each of whom in his heart is sick of the whole escapade, and scandalised at the customs to which he must conform, while none is willing to confess the failure to his friends. Enough has been said about this play to indicate its motives. The situation is well sustained throughout, and the conclusion is agreeably romantic. The manners of the beggars seem copied from reality, and their language is an interesting repertory of Elizabethan slang. But what makes the comedy remarkable under another aspect, is its full expression of that delight in a free, roving life, the life of adventure and close companionship with nature—the *école buissonnière* of existence—which is so strong a

characteristic of the English. We find it in the Robin Hood ballads. We find it again in *As you Like it*. Brome in *The Merry Beggars* has adjusted it to the valet's point of view. This play is one of the few Jacobean comedies revived in the last century. To the comparative regularity of his plot, the sobriety of his language, and his knowledge of stage requirements, Brome owed an honour denied to far nobler dramatists of his time. The affinity between the comedies which were produced immediately before the closing of the theatres under the Commonwealth and the subsequent taste of the nation, involves a question of some interest which can here be only indicated. Are there not signs in the work of our last playwrights of the Elizabethan succession to make it probable that the drama of the Restoration would, in the natural course of evolution, have been produced out of the elements already developed on the stage, even without the intervention of French models, and supposing that the Puritans had never got the upper hand? J. A. SYMONDS.

History of Mary Stuart, Queen of Scots.

Translated from the Unpublished MS. of Professor Petit by Charles de Flandre, F.S.A.Scot., Edinburgh. (London: Longmans, Green & Co., 1874.)

THIS book has a curious history. Written in French, and encouraged by the Empress Eugénie, the fall of the Napoleon dynasty has led to its being first published in a well-done English translation by M. de Flandre. Rumour adds that it was intended as a preliminary to the name of Mary Stuart being placed as a saint in the Calendar of the Church of Rome. Not the less, though written from an avowedly Roman Catholic point of view, is it a forcible argument in favour of Mary's conduct generally, as well as her innocence from the four principal charges of undue familiarity with Riccio, of a criminal connexion with Bothwell, of being privy to Darnley's murder, and to Babington's plot. It certainly belies the motto which the ex-Empress contributes to it—"Quand on est malheureux on n'a pas beaucoup d'amis"—for it adds the translator as well as the author to the host of devoted partisans whom the misfortunes of Mary have attracted to her. There is little in it, and in particular no new documents of any importance, which may not be found in the recent works on the same side—Miss Strickland's full and able life, Mr. Hosack's masterly monograph, Mr. Caird's *résumé* of the leading points in the great controversy, and Mr. Meline's telling though intemperate dissection of the serious errors of Mr. Froude. But it possesses one advantage over these writers, except Miss Strickland—that it presents not merely a discussion of isolated points, but a continuous narrative of the romantic and mysterious life, about which men dispute as fiercely as when Buchanan wrote his *Detection*, and Lesley his *Defence*, whether it was that of a saint and martyr, or of a hypocrite and murderess. A Roman Catholic like M. Petit has a further advantage over defenders who do not believe her creed, that he is able and willing to support her general policy as well

as to acquit her of the special accusations. There are in his book many passages of sentimental commonplace which will delight writers, like Mr. Froude, who believe the controversy is kept alive solely by sentiment; but such is not its general tenor. On the contrary, whether we accept its conclusions or not, the impartial reader will admit that it contains both facts and arguments which well deserve consideration. The truth is—and it is the first step towards a correct estimate of this period of history, and of the character of Mary—her life has concentrated in it as many and as difficult questions of conflicting evidence as have been ever presented to the tribunal of history. Unfortunately no one—with the exception of Mr. Tytler, and perhaps of Mr. Burton—has approached the subject except as an advocate. The false and pernicious paradox of Bossuet, which M. Petit has the naïve candour to quote—“*D’aller faire le neutre ou l’indifférent sous prétexte que j’écris une histoire, serait faire au lecteur une illusion trop grossière*”—might be inscribed on almost every book connected with Queen Mary.

The general issue, to use a legal expression, is much simpler than the special issues raised with regard to her conduct. Her policy, almost from the cradle to the grave, was a Roman Catholic policy. It was determined for her, in the first instance, by circumstances beyond her control, which sent her, in 1548, a child of six, to France, the betrothed bride of the Dauphin. Educated in convents and palaces, she learnt the wisdom of the Romish Church and the Court of France, and, allowance made for the panegyrics of courtiers, there is as little reason to doubt her accomplishments as her personal charm. Brantôme celebrates her learning and natural talents, calls her a human goddess, and tells us that Charles IX. “counted his brother too happy in having enjoyed so beautiful a princess, and that he ought not to regret his death in the tomb, since he had possessed in this world this beauty, though for so short a time.” Her politic uncles, who planned the marriage, thought more of the three deeds she signed on its eve, by which she gave the kingdom of Scotland to her husband should she die childless; in case the Scotch should resist, assigned to him the possession of it until a million of pieces of eight were repaid him for her education; and declared that these deeds expressed her real mind, whatever she might afterwards publish by desire of Parliament. Though her youth is pleaded in extenuation for this treason to her people, the plea is scarcely consistent with the intelligence she showed in her letters of this period, and it will be remembered that shortly before her death she transferred Scotland to Philip of Spain, unless her son should embrace the Romish faith. She accepted with zeal the creed in which she had been brought up. She was forced by the death of Francis to return to Scotland, a land spoken of, in the language she was accustomed to hear, as a country of savages, although her beauty, according to Brantôme, made the uncouth dress of its inhabitants, worn by her, surpass the French or the Italian mode. Here she found the new doctrines of the

Reformation, which she told the Pope she regarded as damnable, making rapid progress. Her conduct towards the Protestants has been represented as an early example of enlightened toleration with as much reason as it has been denied that Knox and the Reformers were intolerant. The fact is that, as she never had it in her power to persecute, the credit of never having done so in such circumstances is not great. That, on the other hand, she was herself persecuted in the exercise of her religion is certain, and this persecution confirmed her in it. It is not, however, to be overlooked that she argued with Knox, despite his rudeness, in such a way as seems to have given him momentary hopes of a conversion, as she afterwards did with the dignitaries of the English Reformed Church; nor, assuming that her marriage with the Protestant Bothwell was against her will, that she was quite willing to marry the Protestant Norfolk. When we read in the letters that she was all the time writing to the Pope, cardinals and Catholic bishops, of her devotion to the Church, in which she would live and die, of her regret at being unable to send Scotch bishops to Trent, and the like, we are not, indeed, disposed to see in this part of her conduct profound dissimulation, but rather the policy of one who would yield even in religion a good deal, but not all, to gain her ends. To a Protestant it will appear that a creed which admits sacerdotal absolution affords temptations for such a policy; but if he is a fair observer, he must have noted instances of it where such temptations have not existed. If this, then, was her general policy, what light does it throw on the special charges? We think, with the doubtful exception of the Bothwell marriage, and her share in Babington’s plot, none whatever. That she was a professed and devoted, though not always a quite consistent Catholic, affords no presumption that she committed adultery or murder. But neither does it prove the reverse. There have been great criminals who have professed this as well as other creeds. The improbability of her submitting to marry a heretic of her own free will would have been considerable, had it not been that she certainly sought for such an alliance with Norfolk. Historians, therefore, will condemn or praise her policy according as they regard it as a good or a bad thing for mankind that the Reformation in England and Scotland succeeded; but each of the specific charges must be considered on its own merits.

The charge with reference to Riccio rests on evidence which lies in narrow compass. He was beyond doubt raised by Mary above his station, and became her favourite, a character of which the history of absolute monarchs has afforded too many odious examples. This was enough to account for the hatred of the Scotch nobles and the jealousy of Darnley. But when the monarch was a queen on bad terms with her husband, suspicion was certain to arise, as it did, that he was loved as well as favoured. Was this suspicion well founded? Darnley believed it, but afterwards disavowed his belief. His weak character renders his belief and his disavowal equally worthless. Ruthven asserted

it in the plainest terms in his narrative of the murder, but the obvious motive of shifting the guilt from himself and his fellow-conspirators makes his testimony untrustworthy. Bedford and Randolph reported it to Cecil from Berwick three days before the execution of the plot, but they also were by their own confession themselves privy to the general design, though not to the barbarous manner in which it was carried out. De Foix, the French ambassador in London, communicated it to his Court as one of the two principal causes of the murder told to the Queen of England. Mr. Froude, in quoting the analysis of his despatch printed by Teulet, alters its terms, and leaves his readers who do not consult the original, to believe that De Foix states this as his own opinion. Such a mode of dealing with authorities cannot be too severely censured. But De Foix accompanies his report with no indication of disbelief. The reasoning of M. Petit—that as the incident which De Foix reports of Riccio being found by Darnley in a closet off Mary’s bedchamber at one in the morning, “*en chemise convert seulement d’une robe fourée*,” is said to have occurred only a few days before the murder, it could not have been the principal cause of the murder, which had been undoubtedly planned some time before—does not appear to us conclusive against its truth. He derives a better argument from the fact that Knox does not directly charge her with guilt; but Knox’s references to Riccio are of an incidental character, and his declaration that Riccio was justly punished “for abusing the Commonwealth, and for his other villany which we list not to express,” is certainly not fairly represented by saying, as Petit does, that he merely calls Riccio “foolish.”

It is argued that all this is merely the suspicion of her enemies; but it is suspicion to which her own conduct gave rise. It certainly is not, however, proof of guilt, and grave suspicion is all that even hostile writers allege.

Her complicity in Darnley’s murder, and the charge of a guilty love for Bothwell, have usually been supposed to hang together. We cannot examine the complicated evidence upon which these accusations rest in detail. The external circumstances: her resentment at the authors of Riccio’s assassination, the favour she showed to Bothwell from that time forward, her evasive letters to Lennox, Bothwell’s pretended trial, her declaration before the Court of Session—which Petit by a strange mistake calls the ecclesiastical session—of his innocence, her hasty marriage, which she refused to repudiate until he could no longer serve her, the reluctance of her representatives at York and Westminster, while making a general denial, to enter into a special investigation of the facts—make so strongly against her, that had it not been for the production of the Casket Letters and the suspicious deposition of Paris, there would now have been little doubt of her guilt. But the proofs, which Mr. Hossack first completely collected, of the way in which this part of the evidence was tampered with or procured, and of the undoubted privy in the murder of Darnley as shown by the Craigmillar Bond, and the meeting at Ainslie’s supper of most of those

who afterwards accused her, have given room to the ingenious argument of her defenders, who, without paying due regard to these external circumstances, seem to think that they have established her innocence when they have shown that false evidence was adduced to prove her guilty.

The mystery of the Casket Letters has not yet been solved, but it is impossible to accept them in their present condition as valid proofs against the Queen. Hardly any one now does so except Mr. Froude, who wholly ignores the evidence against them. Even if the strange story of the capture of Dalglish, Bothwell's servant, "with the small gilt coffer, not fully a foot long, garnished in sundry places with the Roman letter F under a king's crown," by Morton, on July 20, 1567, and the manner in which some of them were first secretly shown to the Commissioners at York, and afterwards the whole, with the two doubtful pre-contracts of marriage with Bothwell and the sonnets, were produced at Westminster, but never shown to Mary's advisers, did not raise suspicions as to their authenticity, the contents of the copies which now remain have never been satisfactorily explained on the hypothesis that they were addressed by Mary to Bothwell. M. Petit, following Mr. Hosack, points out the internal evidence against them: the differences between the French and Scotch copies, as in the passage in the first letter, where "I am irkit" is translated "je suis toute nue" (naked); and the fourth letter, where the expression "mak gude watch" is inserted so as to completely change the sense; the anachronism of referring to Huntly as "your brother-in-law that was," in the eighth letter, before the divorce of Bothwell from his sister; the startling verbal agreement between Mary's account of a conversation with Darnley in the second letter, and Crawford's account of the same conversation in his deposition at Westminster; the extraordinary notanda in the middle and at the end of the same letter, one of which is "of the erle of Bothwell." On the other hand, no conclusive theory of what they really are has been proposed by Mary's defenders. The most ingenious certainly is that of Mr. Hosack, who believes that the first and second letters from Glasgow, and the sixth, seventh, and eighth from Stirling, are forgeries; while the third, fourth, and fifth, of which alone it appears probable that the French originals or direct copies are still extant, were written by Mary, not to Bothwell, but to Darnley. It is strongly in favour of this view that these three letters, with the exception of the interpolation of the words "mak gude watch" in the Scotch version of the fourth, contain nothing damnable, and are much more like letters to a husband than to a criminal accomplice; the reference to two marriages, a private and a public, in the third letter, agrees with what is ascertained to have been the fact as regards Darnley, who was privately married to Mary at Stirling, before her public marriage in Edinburgh, on July 29, 1565. M. Petit does not appreciate the force of this view, and rests too much on difficulties as to their exact dates, which, as the letters themselves are undated, cannot count for much. Mr. Hosack's hypothesis,

however, so far as we know never before stated, is not without its own difficulties. For if some of the letters are genuine, how are we to account for the denial by Lesley of the authenticity of any of them? and how did Mary's accusers procure her letters to Darnley? It may, however, be fairly argued that it is not incumbent on her defenders to show the origin of the fraud, or even its exact nature; it is enough for them if the letters are not worthy of credit, and so much we think they have proved. Nor is it possible to trust the depositions of Paris, which were not published till after his execution, and were taken when his life or death depended on the word of Murray. It is impossible to read these depositions without detecting in them the cowardly assassin ready to tell any story in the vain hope of saving his life. The deposition of Crawford is less suspicious. Even Mr. Hosack appears to credit it, and to suppose the passage in the Casket Letter relating Darnley's conversation with Mary to have been copied from it. M. Petit also uses it as genuine. Neither writer seems to observe that the conclusion of Crawford's deposition plainly incriminates Mary, for Crawford states in it, that having expressed his opinion to Darnley that the Queen took him away more like a prisoner than her husband, Darnley answered

"he thought little lesse himselfe, and feared him selfe; indeede save the confidence he had in her promise onelye, notwithstandinge he would goe wth her, and put him selfe in her hands, though she shoulde cutte hys throate, and besowght God to be judge unto them bothe."

Unable to accept the Casket Letters and the deposition of Paris as valid evidence, but equally unable to dissociate Mary from the charge of complicity with Bothwell, after, if not before, the assassination, her connexion with that "gallant, rash, and hazardous young man" appears to us to have been one of policy, and not of love. The attempt of M. Petit and her other vindicators to show that she was a passive instrument in his hands, cannot be maintained consistently with the facts, or with her resolute character at other crises of her life. On the other hand, apart from the Casket Letters, there is nothing to show that passionate love which her enemies then laid to her charge, and which has been the theme of the later romance of history. It seems fatal to this latter view that, though Bothwell survived till 1575, not a word of communication passed between them after the surrender at Carberry Hill, on June 15, 1567, put an end to her one month's marriage. What seems most probable is that she accepted Bothwell as the only man in Scotland able and willing to play an independent part, and save her from that fierce aristocracy which had determined that, though she might reign, she should not govern.

The recently-discovered papal dispensation which made his marriage with Lady Janet Gordon valid in the eyes of the Church, and consequently that with Mary null, is slightly touched on by M. Petit, as might be expected. It cannot, we think, have been unknown to Mary, who had taken an active interest in the marriage.

Babington's Plot is treated by M. Petit in a separate dissertation, but with less care than

the earlier part of Mary's history. He seems to think that her long captivity, Elizabeth's dissimulation, and the unfairness of a trial which allowed no proper defence to be made, and in which the evidence against her had been procured by Walsingham's spies, throw an onus of proof upon those who now accuse her which they cannot discharge. This position, however, cannot be conceded. The evidence, such as it is, exists, and must be considered. The point in dispute is narrowed to this: whether, besides the general knowledge and approval by Mary of Babington's plot for her own escape and the invasion of England, she was privy to his design against the life of Elizabeth. Her letter of July 17, 1586, exists only in the decipherment of Philips; and M. Petit, following the theory of Prince Labanoff, charges Philips with having interpolated the passage in the letter, as well as added the postscript, which alone refer to the Design of the six gentlemen. The postscript was not found along with the official copy of the letter, but is a separate paper, discovered by Tytler in the State Paper Office in 1842. Mr. Froude urges with force that it is extremely improbable that Philips would have preserved and endorsed a draft of a forgery which he did not afterwards use, for this postscript, unlike the letter itself, does not purport to have been acknowledged by Babington or by Mary's secretaries, Nau and Curle; and he makes the ingenious conjecture that it was an addition to the letter which Curle, in a note to Emilio, the carrier of the letter to Babington, requests him to forbear from using, until he should "put the whole at more leisure in better order." Mr. Froude also answers Prince Labanoff's argument as to the detention of the letter for eleven days, by showing it was due to Philips' absence from Lichfield, where it was sent to him. Neither of these things is, however, conclusive against the interpolation of the passage in the body of the letter, where certainly it appears not quite consistent with the context. Babington's acknowledgment of the authenticity of the letter is made without any qualification, but too much importance seems to be attached to the more qualified expressions of Nau and Curle. The strength of the case against Mary does not, however, rest on this passage nearly so much as on the fact that Babington had certainly communicated to her the design against Elizabeth's life, and that she gave him a general approval. Had he succeeded, it is scarcely to be doubted that Mary would have rewarded him, as she did Hamilton of Bothwellhaugh, the murderer of Murray. M. Petit remarks: "I cannot say if at heart Mary did or did not hate Elizabeth; this much, however, is certain, that she never spoke ill of her, while all her letters breathe gentleness and conciliation." In like manner Mr. Froude has tried to paint Elizabeth struggling as a woman and a queen to save her royal sister, whose death Burleigh and Walsingham felt to be necessary for the security of her throne; but the truth appears to be that, in an age in which dissimulation was deemed necessary to statecraft, both queens were adepts in the art of deception. Mary was, however, the more finished mistress of that art. Sixty different ciphers were found amongst her papers; for

twenty years she had been kept prisoner without power to escape, but with full opportunities for plotting. She plotted without ceasing, conscious that she was watched, and hence developed a wonderful skill in intrigue which has never been surpassed. To describe her during this period as a helpless innocent in the cruel grasp of Elizabeth, willing to kiss the hand that was ready to shed her blood, is a complete perversion of history. She was pulling the wires, not in Scotland and England only, but over all Europe, not merely for her own escape, but for the destruction of the Protestant queen and constitution of England. The selfish ends of the great Catholic princes, the feebleness of the Catholic party in England and Scotland, and the skill of Elizabeth's ministers baffled her. At last, in Babington's plot and the prospect of the Spanish invasion, she seemed to secure the realisation of her hopes; but the detection of that plot brought her own ruin, and the wreck of the Armada that of the Roman Catholic cause in Britain. Caught in the toils of Walsingham, she played the part of a martyr in a way that has deceived more than half the world. She has still almost all Catholics, most women and a considerable number of men who are not Catholics, on her side. But the student who reads history to discover truth cannot pronounce her innocence proved either of Darnley's murder or of the attempt on Elizabeth's life. Æ. J. G. MACKAY.

The Heart of Africa: Three Years' Travels and Adventures in the Unexplored Regions of Central Africa, from 1868 to 1871. By Dr. Georg Schweinfurth. Translated by Ellen E. Frewer. With an Introduction by Winwood Reade. In Two Volumes. With Maps and Woodcut Illustrations. (London: Sampson Low, 1873.)

(First Notice.)

It was perhaps inconsiderate in a savant like Dr. Schweinfurth to give his book a popular title, but it really is a good one. He could not possibly have chosen a truer. If the outline of Africa may be likened to the section of an irregularly-shaped pear, the region to which Schweinfurth penetrated—and which he has been the first to thoroughly explore and fully describe—is the core of the pear. This region, extending over 75,000 square miles, lies between 3° 30' and 8° N., and 26° and 30° E., and is conspicuous on recent maps, particularly French and German, by a gridiron-like patch of rivers all running side by side together north-westward to the Bahr el Arab and Bahr el Ghazal, which hold their straight course from west to east, between the eighth and tenth parallels of north latitude. The Bahr el Ghazal, receiving in its course the Bahr el Gebel and Giraffe, which drain the Albert and Victoria lakes and southern Nile region generally, flows on due west to its confluence with the Gobat, where, striking northwards, the united rivers flow on as the White Nile to Khartoom, where, joined by the Blue Nile from Abyssinia—the eastern Nile region—the main stream of the Nile begins. "The Heart of Africa" is the western Nile region therefore—in which arise the springs of the head waters of the numerous affluents of the

Bahr el Ghazal, the only westward tributary of the Nile—"the river of Egypt." The Bahr el Ghazal was first entered, in 1854, by a native merchant of Khartoom. He was followed, in 1856, by Petherick; and in 1863 Mlle. Tinné, with Von Heuglin and Steudner, extended their explorations from the landing place of Meshera el Rek across the Dinka country and across the affluents of the Bahr el Ghazal westward along 8° N. as far as the Dyoor, and the Dembo. The Italian Piaggia had also obliquely traversed this Western Nile region to its south-west limits, to the country of the Niam-Niam, among whom he lived for a year. Schweinfurth, after leaving the Bahr el Ghazal at Meshera, went south-west eighty miles to Ghattas Seriba; whence he explored the country in a general southerly direction 250 miles across the confluent of the Welle to the Seriba of Munza, the King of the cannibal Monbuttoos in 3° 30' N. and 28° 10' E.; and returning to Ghattas Seriba, he wandered rather than explored westward, 150 miles, to Gudyoo in 26° E. and 7° 15' N. It was thus the western and southern confines of the great basin of the tributaries of the Bahr el Ghazal which Schweinfurth actually traversed, and it is no exaggeration to say that there is scarcely a single stream of the Nile, of this Western Nile region, which he did not cross, and was not able to map in the course of his two journeys. This is the most interesting of the many valuable geographical results of his travels.

Schweinfurth (ii. 113) expressly disclaims having found any new source of the Nile, and yet he is the only European who has ever seen a living fountain of the White Nile:

"Mount Baginze (20° 15' E. and 4° 30' N.) is only four miles to the SSE. of Damvo, but this short distance has to be accomplished by a circuitous and troublesome route leading across deep fissures and masses of loose rock, and often through grass of enormous height. Half-way we came to a rapid brook hastening along through a deep cleft, which we were able to leap across. This was the source of the Dyoor. It was the first actual source of any of the important affluents of the White Nile to which any European traveller had ever penetrated. My Niam-Niam escort, who were natives of the district, positively asserted that this brooklet was the Sway, and thus plainly demonstrated that, however insignificant this little vein of running water might appear, they were accustomed to consider it as the highest section of the waters that contributed to the formation of the Dyoor. The Sway, they said, was the largest and loftiest river of their land; Baginze was their loftiest mountain; and this was the most important stream that issued from its clefts." (ii. 213, 214.)

But his greatest geographical discovery was of that part of the watershed of the Western Nile basin inhabited by the Niam-Niam, and of the water-parting defined by the westward flow of the river Welle. He had reached the water-parting between the Lendukoo and Mbwole, about 28° 30' E. and 4° 30' N., on his first route southward to Munza's Seriba:—

"The direction which the river Lindukoo was taking appeared to me to be exactly the reverse of that in which flowed the current of the Yabboo; and in spite of the positiveness on the part of the guides, all their statements left my mind unconvinced, and in a state of considerable perplexity. But two months later, when I had again to cross

the river some distance further to the east, my presentiment was thoroughly confirmed. The formation of the land just here is very uneven and irregular; quite in contrast to what it was observed to be both previously and subsequently upon our progress. With the Lindukoo, then, I was bidding farewell to the district of the Nile. Many as there had been before, who had undertaken to explore the mighty river to its fountain-head, here was I, the first European coming from the north, who yet had ever traversed the watershed of the Nile. Upon this memorable day of my life I confess I had no real knowledge of the significance of the soil upon which my steps were tarrying, for as yet I could know nothing of the configuration of the country before us. The revelation of the truth about this watershed only became apparent to me after I had gathered and weighed the testimony of the Niam-Niam, which sufficiently demonstrated that the next river, the Mbwole, belongs to the system of the Welle. This river now was an enigma to me; and to unravel the hydrographical perplexities which surrounded it, continued throughout my journey to puzzle my brain; certainly I was satisfied it could never be brought into unison with any of the tributaries of the Sway." (i. 493-494.)

A little patience and the problem was solved.

"At length the attainment of my cherished hopes seemed close at hand. The prospect was held out that on the 19th of March we might expect to arrive at the Welle. The way to the river led us due south, and we went onwards through almost uninterrupted groves of plantains, from which the huts, constructed of bark and rotang very skillfully sewn together, again and again peeped out. A march of scarcely two leagues brought us to the bank of the noble river, which rolled its deep dark flood majestically to the west, in its general aspect suggesting a resemblance to the Blue Nile. For me it was a thrilling moment, that can never fade from my memory. My sensation must have been like Mungo Park's on the 20th of July, 1796, when, for the first time, he planted his foot upon the shore of the mysterious Niger, and answered once and for all the great geographical question of the day—as to whether its waters rolled to the east or to the west. Here, then, I was upon the very bank of the river, attesting the western flow of the water, about which the contradictions and inconsistencies of the Nubians had kept up my unflagging interest ever since we set out from Khartoom. Whoever has any acquaintance with the indistinctness that ever attaches to the statements of those who would attempt to describe in Arabic the up-current or the down-current of a river, will readily comprehend the eagerness with which I yearned to catch the first glance of the waters of which the rippling sound, as they washed the stony banks, came through the bushes to my strained and listening ear. If the river should flow to the east, why then it solved the problem, hitherto inexplicable, of the fulness of the water in Lake 'Mwootan [Baker's Albert Nyanza]; but if, as more likely, it should go toward the west, then, beyond a doubt, it was independent altogether of the Nile system. A moment more and the question was set at rest. Westerly was the direction of the stream, which consequently did not belong to the Nile at all; it was in all likelihood not less than 186 miles distant from the north-western coast of Lake 'Mwootan [Albert Nyanza], and at the numerous rapids which are formed in its upper course, it rises almost to the level of the lake, even if it does not attain a still higher altitude." (i., 548, 549.)

The Welle had all the character of a mountain stream, and the result of Schweinfurth's enquiries seemed to demonstrate most satisfactorily that to the south-west of Munza's Seriba the land takes a decided rise, breaking into hills and isolated mountains, and that

these are none other than the western fringe of the "Blue Mountains," which Baker observed from the farther side of Lake Mwootan, or Albert Nyanza, and of which, as he saw them from the north-west side of the lake, he reckoned the height to be 8,000 feet. Schweinfurth identifies the Welle as the tributary of the Shary, the river discovered by Denham in 1824, flowing into Lake Tsad.

The discovery of the Welle of course explodes the hypothesis that the Lualaba may be a source of the Nile. This is the river which forms itself in the great region of water-springs to the west of Lake Tanganyika, and Livingstone thought might be a source of the Nile, a supposition (ii. 186) that might have some semblance of foundation from its northward course, and the inexplicable volume of water in the Albert Nyanza, but which was negatived completely as soon as more ample investigation had been made as to the comparative level, direction, and connection of other rivers, especially of Schweinfurth's Welle.

Although animated by the simple enthusiasm of all true explorers, Dr. Schweinfurth is the most modest of discoverers, and the most generous in his recognition of the work done by others. This, therefore, makes his utterly unjust and unworthy attack on Bruce, one of the most learned and accurate of the innumerable explorers of the Nile basin, all the more pointed and painful. It is thus he writes of the sagacious philosopher of Kinnaird:—

"One of the objects contemplated in my journey was to show the importance of the Western affluents of the Nile which unite in the Gazelle; and I have given evidence that one way and another they traverse a region of not less than 150,000 square miles. When I mention that in 1863 Speke called the Gazelle 'an unimportant branch,' and, moreover, that Baker has spoken of its magnitude with great depreciation, in reply, I might allude to another interesting fact in geographical annals. Not only did Bruce a hundred years ago suppose that he had discovered the sources of the Nile in Abyssinia, just where a hundred years previously they had been marked upon the Portuguese maps; but he represented the Bahr el Abiad as an inconsiderable stream, which joined the stream of his discovery at Halfaya, Khartoom at that time not being in existence. But it is absolutely impossible that Bruce could have returned from Senaar to Berber along the left bank of the Blue Nile, and could have crossed at its mouth from the very spot where Khartoom now stands, without being aware that close behind him there was rolling its waters a stream as broad again as the Blue Nile. The plain truth is that the White Nile was overlooked and disparaged because it would have thrown his Blue Nile in the shade. Ismail Pasha was quite right in saying that every fresh African traveller had his own private sources of the Nile; but for my part I am not at all ashamed to confess that I have not found them."

Undoubtedly one of the first thoughts which spontaneously occur to the reader of Dr. Schweinfurth's great and most interesting explorations of the Nile is that after all we are as far off as ever from the true sources of the Nile. The *Caput Nili* in fact continues to be as great a mystery as in the days of Herodotus. Schweinfurth has now as completely and exhaustively explored the Western Nile basin as Bruce did the Eastern—or Abyssinian; while Burton, and Speke, and Grant, and Livingstone have

brought back to us a sufficient knowledge of the extreme southern limits of the Nile basin to prove that neither is the *Caput Nili* there. But Bruce always said that the true headwaters of the Nile would be found in the mountainous wilds of Kaffa and Narea—which remain unexplored to this day, and to which he showed that the phenomena of the inundation also pointed as the source of the Nile ("the river of Egypt"). In vol. iii. p. 333 (3rd edition), he says that the mountains of Kaffa are the highest land in Africa; and at page 105 of vol. vii. that the White Nile (*el Aice*) rises in the country south of Narea "supplied with perpetual rains," and therefore the White "never diminishes as the (Blue) Nile does, in the latitude of whose fountains the rains prevail only at stated times." In vol. v. p. 370, he accounts for certain appearances of the Nile inundation by the bursting of immense marshes in the country about Narea; and further on, at page 384, he remarks that in latitude 9°, in the kingdom of Guigiro (east of Limmon), the Zebee runs south or south-east into the inner Ethiopia, as do also many other rivers, and, "as I have heard from natives of that country, empty themselves into a lake, as those on the north of the line (Blue Nile, &c.) do into Lake Tzana." In the same volume, at page 332, he says, before March "green boughs and leaves appear floating on the Bahr el Abiad;" and at page 370, "the true reason of this appearance is from those immense marshes spread over the country about Narea and Kaffa . . . where the water accumulates and is stagnant before it overflows into the river Abiad, which rises there."

The annual inundation of the Nile of itself would appear to force us to accept whatever river or rivers may arise in Kaffa and the Galla country as the true sources of the Nile; whether they empty into the Nile direct, as the Sobat, or indirectly through the Victoria Nyanza, or any other of its system of equatorial lakes, as the unknown Asua is said to flow, in its course to the Nile, through Lakes Zamburu and the Bahri Ngo. The inundation of the Nile begins in Egypt in June, about St. John's Day, and continues to the end of September. The rains on the plateau of the network of the Victoria Lake system fall from November 15 to May 15. The phenomena seem quite unrelated; and it is evident that the complete explanation of the inundation of the Nile necessitates the supposition that there are some feeders of the White Nile, the flooding of which is complementary to the overflow of the equatorial Nile lakes. These feeders must also needs be in the Tropic of Cancer, in which the rain falls in summer and autumn, as it falls in the Tropic of Capricorn in winter and spring; and where can we look for them but in the unexplored part of the Nile basin lying wide extended between Abyssinia and the Equator? In his passage through Capricorn, the sun surcharges the equatorial lakes with the rains which fall from November to May; in his passage through Cancer, the rivers of Kaffa, Narea, and Galla in turn become swollen, and, descending into Egypt on the crest of the flood of the Victoria and Albert lakes, constitute there the annual inundation. In

the passage of the sun through Cancer the greatest fall of rain in these regions takes place where the moisture which the sun draws in his course is condensed against mountain ranges; so that the further we travel westward from the highlands of Abyssinia, more and more to the south lie the limits of the summer rains in Africa. It is clear, therefore, that we must look for the rivers which complete the annual inundation of the Nile in Egypt, not in Schweinfurth's Western Nile region, but amongst those lofty mountains of Ganka, Audak, and Narea, to which Bruce pointed as the true shrine of the inviolable mystery of the *Caput Nili*.

Bruce knew perfectly well, and states it, as has been shown, over and over again, that the perennial stream of the Nile was due solely to the White Nile; and that the Blue Nile, even in its summer flood, was but a tributary. Had an Ainsworth been at his elbow, indeed, the map to his travels would even possibly have anticipated the discovery of the great southern Nile lakes, as the Portuguese maps, according to Schweinfurth, anticipated Bruce's own discovery of the Blue Nile by a hundred years! Dr. Schweinfurth has been thoughtlessly assailed by Mr. Stanley, because he has proved, by his discovery of the Welle, that Livingstone was manifestly in error in supposing that the Lualaba flows to the Nile; and at least this might have warned him to show a larger consideration to the memory of a true man whose declining life was embittered by the sneers of the inventive author of *Baron Münchhausen*.

GEORGE BIRDWOOD.

Robert Greene's Leben und Schriften. Eine historisch-kritische Studie. Von Wolfgang Bernhardi. (Leipzig: Verlag der Volksbuchhandlung, 1874.)

HERR BERNHARDI'S *Life and Works of Robert Greene* is a critical arrangement of such biographical and literary notices of the poet, as the biographers, especially Dyce, have brought together. Unfortunately for him, he has had to trust to deductions and statements not his own, which have often led him astray. Thus when Greene says to Marlowe,

"Is it pestilent Machivellian policy that thou hast studied? . . . The broacher of this diabolical Atheism is dead . . . ended in despair . . . inherited the portion of Judas . . . perished as ill as Julian,"

Malone, followed by Dyce, interprets this to be Francis Kett, burnt at Norwich as a heretic in February, 1589, who had been fellow at Bennet College at Cambridge while Marlowe was there, and therefore had very likely been the teacher referred to. This is nonsense. The broacher of the Machiavellian doctrine was Machiavelli, who in Greene's day was generally believed in England to have perished, like Judas, by his own hand. But Herr Bernhardi adds to the error by inferring that it was Kett also who persuaded Greene to adopt the temporary atheism which he confesses. Kett was a thoroughly earnest Unitarian. Marlowe and Greene were not of Kett's school, but of that of Hariot, Raleigh, and the Earl of Northumberland, which all the old women

of the day accused of atheism. No doubt they were *politiques*, and being so, were held in about the same estimation as Freemasons are now at the Vatican. It is not the special error, but the philosophical spirit, the supposed source of all errors, which is obnoxious to religious prejudice. Raleigh in this respect was more odious than Kett. Andreas Philopater in 1591 tells us of the much-frequented "atheistical" school of Walter Raleigh,

"quam modo ita notam et publicam suis in aedibus habere dicitur, Astronomo quodam Nicromanceo praeceptore, ut juvenitulis nobilioris non exiguae turmae tam Moysis legem veterem, quam novam Christi Domini . . . irridere didicerint."

The Astronomer and Necromancer is, of course, Harriot, who, according to Richard Bame, was Marlowe's idol.

"He affirmeth," says Bame, "that Moses was but a juggler, and that one Harriots can do more than he."

Then with respect to dates. Herr Bernhardt gives the date of Greene's *Menaphon* and Nash's first coming to London as 1587, instead of 1589, not knowing the absolute proof of the latter date given by Mr. Petherham in his edition of Nash's *Almond for a Parrot*, and places the writing of the epistle prefixed to Greene's *Farewell to Folly* in 1587, when the novel was written, instead of 1591, when the book was first published. The latter date is absolutely proved by the phrase, "I cannot Martinize," which occurs in the epistle. As *Martin Marprelate* first appeared in 1589, the verb derived from the book cannot be older than that date.

The import of these errors is that they have led Herr Bernhardt to give quite unproved dates to Greene's plays. Thus, the preface to Greene's *Farewell to Folly* refers with the bitterest sarcasm to the play of *Faire Em* and its author. But the first scene of *Faire Em* is a palpable imitation of the first scene in Greene's *Friar Bacon*. Therefore *Bacon* is the older of the two plays. But the preface in question cannot be shown to be earlier than 1591, instead of 1587; therefore *Friar Bacon* cannot thereby be proved to date from 1586.

Another chain of reasoning is this: *Locrine* was written in 1587, perhaps before the execution of the Queen of Scots, or even before the Babington conspiracy in September 1586. (It must have been so, for it was written by one of the then executed Babington conspirators, Charles Tylney, and edited by W. S. in 1595.) But *Locrine* has a passage imitating some lines in Greene's *Alphonsus*, and *Alphonsus* is a kind of parody of *Tamburlaine*, and, especially in these lines, directly follows some lines of Marlowe's in that play. Therefore *Alphonsus* is before *Locrine*, and *Tamburlaine* before *Alphonsus*; and *Tamburlaine* must be dated very early in 1586.

But *Locrine* also contains two lines extracted from Peele's *Farewell to Norris and Drake* in 1589. I do not therefore say that *Locrine* is later than that. I imagine that W. S., the "ironical censurer" of other men, who had been accused of stealing from Marlowe and Greene and Peele, was willing to show what manner of plays his would be if he imitated those models; and therefore that he interpolated passages from Greene and Peele into the stilted and tedious old tragedy

of *Locrine*, and so set it forth "overseen and corrected by W. S." And at the same time, by a double irony, that he wrote a comedy in Marlowe's style, who had no comedy in his composition, and stuffed it full of lines taken bodily out of Marlowe's plays, and put into the most incongruous company. And thus we have the first sketch of the *Taming of a Shrew*. But to return to *Locrine*. It is difficult to believe that such a couplet as the following was written seriously:—

"For with my swor[r]d, this sharp curtle axe,
I'll cut asunder my accursed heart—"

which Thackeray unconsciously imitated in his ballad—

"Meagher of the Sword,
'Tis he will steep that battle-axe in Saxon gore."

In putting forward this hypothesis, I am not bringing myself within the danger of Mr. Fleay's tests, which only apply to Shakespeare's natural offspring—not, I presume, to his parodies and pilferings. At any rate *Locrine*, though substantially written before September 1586, was subsequently enriched with lines taken from Greene's *Orlando* and *Alphonsus* and Peele's *Farewell*; and so it cannot be used to prove that the purloined passages were in existence before September 1586, and Herr Bernhardt's careful erection falls to the ground.

It is not satisfactory to have to make these objections. They suggest to us that it is we English who are answerable for all this loss of time and wasted industry of our German fellow-workers. Without careful reprints of Greene's, and Nash's, and Chettle's, and Harvey's, and Lodge's books, the German workers on Shakespeare are forced to depend altogether on the notices and extracts which we give them. And if their defects are only due to their defective materials, the fault is ours, not theirs. So far as Herr Bernhardt has sufficient materials at his disposal, so far he is generally right. His exposition of the parallelism between *Alphonsus* and *Tamburlaine* is manifestly correct, and his guess that *Locrine* must be dated before the Queen of Scots' death or the Babington conspiracy, though he does not give the grounds of his opinion, is a curious approximation to the truth. Also his discovery that Greene attacks *Faire Em* in his *Farewell to Folly*, is an evidence of his careful reading; while his conclusion that the author of *Faire Em* was one of the "gentlemen poets" who attacked Greene on the stage seems a fair critical deduction. It is hardly fair to say that "the English strangely regard *Faire Em* as Greene's." Dyce did not include it in Greene's works; and if Philipps, in his *Theatrum Poetarum*, attributed it to Greene, on the other hand the librarian of Charles II. labelled it as Shakespeare's. *Faire Em* is a play which deserves much more attention than it has yet had on the part of those who undertake to investigate the relations between Greene and Shakespeare.

R. SIMPSON.

MINOR HISTORICAL BOOKS.

History of the English Institutions. By Philip Vernon Smith, M.A., Barrister-at-Law. (Rivingtons, 1873.)

THIS is one of a series of "Historical Handbooks for use in Schools," and is of a higher character than many books of similar design. It includes

the period from "the settlement of the Angles and Saxons in this island" to the present time; and the manner in which the various subjects have been selected shows a just appreciation of the task which the author had before him. He makes no claim to original research (though he appears to have consulted the statutes for himself), but professes to have compiled his work from "standard" authorities, of which he gives a short list. It is hardly to be expected that handbooks should be written on any other principle. They cannot be more correct, and must almost inevitably be a little less correct, than their sources. They are also apt to show some little inconsistencies, through the necessity of following one authority in one place and another in another. From such blemishes Mr. Smith's work could not be entirely free; nor is it his fault if, when the guides disagreed, he has not always followed the best. In treating the earlier history he would have done better to trust Mr. Stubbs, one of whose works he mentions, than some other writers. In his preface, for instance, Mr. Smith says he has adopted the "modern spelling of Teutonic proper names," by which expression he appears to mean that he spells Edward Eadward, and Ethelred Æthelred. Mr. Stubbs, the only one of Mr. Smith's "authorities" who has shown any intimate acquaintance with ancient MSS., does not commit himself to the many inconsistencies involved in this change; nor would any palaeographer allow that there was a fixed orthography of proper names in England till long after the invention of printing. The question is, indeed, one of no real importance to scholars; but it seems a pity that boys should learn to pride themselves on superior accuracy in spelling when they are only being crammed with a crotchet, and a still greater pity that they should have all their ideas on the subject unsettled by being taught to read about Alfred in Mr. Stubbs' *Select Charters*, and Ælfred in Mr. Smith's *English Institutions*. It ought also to be mentioned that, from Mr. Smith's essentially Teutonic point of view, the Latinised form "frithborga" is somewhat out of place in his pages; and, considering the works he has consulted, it is not easy to understand his statement that, when the Teutonic invaders came, "the territory occupied by each tribe was called a *scira*." There are two or three other slips which show that Mr. Smith has not studied the earlier period for himself; but, as a whole, the book may, nevertheless, be described as a useful compendium conscientiously put together. The plan upon which it is written is to give, in the first instance, a continuous narrative of each institution or group of institutions; but there are sections numbered in each chapter to correspond with the six periods into which the work is divided. A student can, therefore, very readily obtain a general glance at the whole of the institutions of any one period by reading the whole of the sections which bear the same number. He finds (to give an example) a sketch of the history of local government by itself, and a sketch of the history of imperial or central government by itself; but by a simple mode of reference he can easily compare any feature in the one with any feature in the other, as it appeared during any of the six periods.

A Glossary of Cornish Names, ancient and modern, local, family, personal, &c.: 20,000 Celtic and other Names now or formerly in use in Cornwall, with Derivations and Significations for the most part conjectural, suggestive, and tentative of many, and Lists of unexplained Names about which information is solicited. By the Rev. John Bannister, LL.D., Vicar of St. Day. (Williams and Norgate, 14 Henrietta Street, Covent Garden, London; and 20 South Frederick Street, Edinburgh. J. R. Netherton, 7 Lemon Street, Truro.)

The recent death of Dr. Bannister recalls to our recollection the above work, which we have not hitherto noticed. Dr. Bannister's design has been to show how much of the old and but recently extinct vernacular of Cornwall is still preserved in its

local names, as regards the names of places, family names, and personal names, as found upon inscribed stones and other ancient records. Old Dolly Pentreath has had the reputation of having been the last who could speak the Cornish language. She died in 1778, and that eminent philologist, Prince Lucien Bonaparte, a few years ago, in conjunction with the Vicar of the parish of St. Paul, Cornwall, where she died, erected a monument to her memory. Dr. Bannister, however, has shorn poor Old Dolly of her glory by calling attention to a later Cornish-speaking inhabitant in the person of one William Bodenner, who lived until 1794. The latest, therefore, is nearly a century ago; and seeing that the literary remains in the Cornish language are exceedingly scanty, Dr. Bannister has done well in his endeavour to excite an interest in this ancient Celtic dialect, and to preserve from oblivion such words and names as yet remain. He has with much zeal taken up the subject as a labour of love, and his work exhibits considerable learning and ingenuity, and marvellous industry and perseverance. It does not pretend to be exhaustive or complete. Many of the definitions are merely tentative, and some it is difficult to accept. This could scarcely be otherwise in a work of this nature, as in numerous instances the names have become so corrupted as to render it almost impossible to discover their original roots. It is, however, a work which should have a place in the library of every philologist. At the time of Dr. Bannister's death he was engaged in the preparation of a larger work, entitled *The Nomenclature of Cornwall*, which was almost ready for the press, and we are glad to hear that the MS. has been secured by the authorities of the British Museum.

Loudon's Letters. By Karl Bachberger. (Vienna, 1873.) 76 pp. 8vo.

LAUDON—or, more strictly, Loudon—was one of the generals of the time of Maria Theresa and Joseph II., whose memory is still popular with the Austrian people. Yet, in his lifetime, the ambition of Joseph II. for warlike laurels thrust him back from the foremost place. The letters now published are twenty-five in number, mostly addressed to a friend, Baron von Hochstätter. Though of no special historical importance, they are not without interest, as the writer does not conceal his opinions on the operations of the Seven Years' War. One letter too, from the General to Maria Theresa, should not pass unnoticed, as it contains a proposal that a pension destined for himself should be transferred to a comrade who had been overlooked.

EDITOR.

NOTES AND NEWS.

MR. W. R. S. RALSTON is about to publish the course of lectures on Early Russian History, which he recently delivered at Oxford.

MESSRS. MACMILLAN have in the press a volume of Essays by Professor Blackie, to be called *Horæ Hellenicæ*. Several of the essays are directed against some of the views of Grote and Max Müller; and the volume treats of many of the disputed points of Hellenic philology and antiquity.

THE Manchester branch of the New Shakspeare Society held its first meeting on Monday last, in the rooms of the Literary Club. Mr. Joseph Thompson, a member of the City Council, and one of the governors of Owens College, presided, and in the course of his opening address, said it was peculiarly fitting that a branch of the New Shakspeare Society should be formed in Manchester, whose citizens, in the tercentenary year, instead of favouring the project of a statue on the Thames Embankment, or caring for pageantry at Stratford-upon-Avon, had preferred to perpetuate the memory of the poet by founding two Shakspeare scholarships for the encouragement of the study of English literature—one in its ancient grammar school,

and the other in its new Owens College. The Rev. T. G. Fleay's paper on "Metrical Tests as applied to Dramatic Poetry" (sent in proof from the Society in London), was read by Mr. J. H. Nodal, and a brief conversation followed, in which Mr. George Milner, the Rev. A. S. Steinthal, and Mr. Charles Hardwick, author of *The History of Preston*, took part. Mr. Steinthal made an eloquent reference to the chief promoters of the Society in London, to whom, he said, the country owed a debt of gratitude for their services to philological research and to the study of the older language and literature of England. The names of the Mayor of Manchester (Alderman Watkin), Sir Joseph Heron, Town Clerk of Manchester, and Mr. Hugh Mason, late President of the Chamber of Commerce, were given in as members of the Society during the evening.

Fall of Prince Florestan, of Monaco: written by Himself (Macmillan & Co.). The framework of this pleasant *jeu d'esprit* is as follows. By an odd concatenation of circumstances, a Württemberg cadet educated at Cambridge succeeds to the principality of Monaco. He drills all his subjects of military age, which is a popular measure, as it gives the young married men a holiday from their wives every week; begins a picture gallery out of the profits of the Casino; and alienates the Jesuits by trying to introduce lay instruction. Consequently when he receives Garibaldi, there is an *émeute*, and he abdicates rather than use force or promise to obey the Jesuits. By an informal vote Monaco is annexed to France, and we should have heard more about it but for the general election. The humour of this kind of thing depends upon the ingenuity with which the writer can invent fictitious situations to throw light upon the logic of real ones. "Prince Florestan's" ingenuity is in danger of being pointless for want of application, as it is impossible to guess what real situations, if any, were in his mind; but the odd audacity of the invention will most likely be sufficient to attract readers. Individual touches are good, e.g. the description of M. Blanc, who in twenty years will resemble M. Thiers as much in personal appearance as he does already in tact, power of talking, and the combination of a complete absence of fixed opinions upon any subject with a decided manner. He wishes, we learn, to attract the English, and hesitates between a Protestant church and pigeon shooting. There is a materialistic doctor quite content to be tolerated on condition of always voting with the Jesuits, who can quite understand that the Prince "should wish to be thought to wish to make changes," but not that he should wish to make them. "Prince Florestan" is not an Anglomane; he thinks our constitutional monarchy is a democratic republic, tempered by "snobism and corruption." Our "materialistic world of fashion goes alternately to Mr. Wilkinson and Canon Liddon, Mr. Haweis and Mr. Stopford Brooke, and does not believe a word that any of them says—unless it is Mr. Haweis; but then, doctrinally speaking, he says nothing." Lest the reader should find "Prince Florestan" too like Mr. Haweis, he is careful to intimate that French Radicals had better pretend to believe in the immortality of the soul.

THE German Government have informed Lord Derby that they will allow the Early English Text Society to keep the Göttingen MS. of the *Cursor Mundi*—which the society is printing side by side with three other copies of the work—till December 1 next, being a year beyond the first six months for which the loan of the MS. was granted. The time needed for copying all the four MS., of over 20,000 lines each, composing them, printing, correcting and revising proofs by each of them, has been, and is, so great, that not more than a third of the work is yet done. The book, when finished, will be the largest the society has undertaken, and contain more comparative matter. The Chaucer Society's "Six-text" *Canterbury Tales*, and the Clarendon Press Wycliffite Versions of the Bible are the only books to be compared with it.

A NEW volume of Sermons, by the Rev. H. R. Haweis, of St. James's, Westmoreland Street, Marylebone, called "Speech in Season," will shortly appear (H. S. King & Co., publishers). It is divided into three books:—I. *New Readings*—which reverse a great many of the popular notions about Christianity, showing by a reference to history how largely the words of Christ have been misunderstood; and attempting, by a similar method of criticism, to define the relations between dogmatic theology and the liberal theology of the day. II. *Old Problems*—in which such matters as "Hell," "Insanity," etc., are discussed; and III. *Special Occasions*—including the sermon preached at Westminster Abbey on the death of the late Bishop of Winchester.

Thoughts for the Times, by the same author, published 1873 (H. S. King & Co.), is reprinting for a sixth edition.

WE understand that Mr. James Sully has just completed for publication a series of psychological essays, which discuss, among other subjects, the aesthetic principles of music and of the arts that embody human character. The work will be issued by Messrs. H. S. King & Co.

MR. MORFILL, of Oriel, will print, in his forth coming volume for the Ballad Society, a work of George Puttenham (the author of the well-known *Arte of English Poesie*, 1589), which, from the neglect of the compilers of bibliographical handbooks, has been supposed to be lost, namely, his *Partheniades*, a series of MS. verses, written probably for New Year's Day, 1578, in honour of the Virgin Queen, Elizabeth, whose beauty, cleverness and goodness he praised highly. The first of the series is headed: "The principall addressee in nature of a New Year's gifte, seeminge therebyve the Author intended not to have his name knowne," and runs thus:—

[Side Note] Parthe: 1. Thaleia.

"Gracious Princesses, where princes are in place
To geue you gold, and plate, and perles of price;
It seemeth this day, saue your royall aduice,
Paper presentes should haue but little grace.
But sithe the tyme so aptly serues the case,
And, as some thinke, youre highness takes delighte
Oft to perue the styles of other men,
And oft your selfe, with Ladye Sapphoes pen,
In sweet measures of poesye t'endite
The rare affectes of your hevenly sprighte.
Well hopes my Muse to skape all maner blame,
Vttring your honours, to hyde her owners name."

How then has Mr. Morfill identified this work with Puttenham's Poem? By finding that its sixteenth set of verses contains the line quoted by Puttenham in the following extract from his *Arte of English Poesie*:—

"This considered, I will let one figure enjoy his best beknowen name, and call him stil, in all ordinarie cases, the figure of comparison, . . . as when we sung of our Soueraigne Lady thus, in the twentieth [16th in MS.] Partheniade:—

'As faulcon fares to bussardes flight,' etc.

The original is in the Cotton Collection in the British Museum, Vespasian E viii., beginning at leaf 169, was printed in the first edition of Nichols's *Progresses of Queen Elizabeth*, and reprinted in Haslewood's *Ancient Critical Essays*, 1811; but these prints are not entered in Bohn's *Lowndes*, or Hazlitt, nor does the British Museum catalogue of MSS. notice them. Puttenham's authorship of the *Partheniades* was known to his contemporaries, as the name occurs in the "list of his works taken by mister Steevens from a MS. memorandum of Ben Jonson," printed in note † on p. 304 of Ritson's *Bibliographia Poetica*. Puttenham was proud of "Thames' two sides," that "lovely Londone," whose praises our old poets always sang, and the Queen's palaces:—

. "tems to sydes;
Tems easy for hys easye tydes,
Built all along with mannours riche,
Quinborow salt sea. brackish Greenwich;
Then that where Britton raygne beyond,

The Tower of lously Londone;
Westminster old and new Pallace;
Richemounte, not great but gorgias;
Huge Hampton court, that hath no peere
For stately roomes and turrets cleere,
Save Windsor, sett on Barrockes border,*
That temple of thy noble order,
The garter of a lovely dame,
Which gave yt first device and name."

The date of the poem seems to be 1578, twenty years after the Queen left her studies to ascend the throne in 1558:—

But O now twentye yeare agon,
Forsakinge Greece for Albion,
Where thou about doost rule and raygne.

PROFESSOR NERUCCI and Professor Comparetti are going to publish a complete collection of Italian popular stories, after the pattern of Grimm's *Mährchen*. The work will consist of three volumes; two volumes of text containing numerous specimens of Italian dialects, and one volume of notes, chiefly by Comparetti. The first volume is in the press. The work will be published by Loescher, Venice.

FROM a batch of numbers just received of *Unsere Zeit, Deutsche Revue der Gegenwart*, published fortnightly at Leipzig, by F. A. Brockhaus, we select an article by Georg Honegger on "Der Moderne Englische Sensationsroman," as likely to prove of most interest to readers in this country. According to this writer, the history and development of English fiction in the present century must be sought for in the works of the three great authors, Walter Scott, Lord Lytton, and Charles Dickens. To the consideration of them, however, but little space is given, for, after a brief summary of the peculiarities of each, which does not differ much from the views entertained by some of our best critics over here, Herr Honegger invites his readers to follow him in the study of the most modern sensation novels. Mr. Harrison Ainsworth is designated as the father of this school of literature, whose not inconsiderable talent, as displayed in his early works, speedily sank into a "charakterlose Vielschreiberei." It is curious to find Thackeray the next author to be reviewed as a sensationalist, but such is the case in this article, though the estimate placed upon him is as high as his warmest admirers could wish. Thackeray depicted the habits of the English gentry; Mrs. Beecher Stowe those of the slave-holding aristocracy of the Southern States—a sufficient reason in the eyes of our writer to place the two in juxtaposition. After *Uncle Tom*, however, nothing is to be found to admire in this lady's writings, and he adds that she has irreparably damaged herself by the hideous Byron controversy stirred up a few years ago. Foremost in the school of Dickens is placed Mr. Wilkie Collins, and three or four pages are devoted to a careful analysis of the *Woman in White*; next in the same school figures Mr. Edmund Yates, whose merits and defects are illustrated by an analysis of *Land at Last*. "An equally-matched rival in the reading world of circulating libraries" with Mr. Collins and Mr. Yates is Miss Braddon, whose *Doctor's Wife* is taken as a sample of her powers. Herr Honegger's judgment on this entire phase of literature is anything but favourable. It is distinguished, he writes, neither by novelty, originality, nor by any marked degree of inventive power; and the highest effect is attained, when the dexterous author, by the ingenuity of his plot, can make a sensitive woman's heart beat. "Im ganzen ist's doch wieder eine Literatur der Verzweiflung."

THE chief point of interest about Mr. Fleay's first paper before the New Shakspeare Society last week, was, whether the Ryme-test was alone sufficient to determine the chronological order of Shakspeare's Plays. Mr. Fleay never said that it was; but as he used it as the chief test to settle his scheme of the succession of the plays, men

* The edge of Berkshire.

naturally desired to know what the result of applying the test by itself would be. That result could not be got from the tables printed in Mr. Fleay's paper, of which copies were distributed at the meeting.* The chief table contained only numbers of lines from which the result could be worked out. Mr. F. D. Matthew, a member of the Society's Committee, has now worked out the proportion of rymed 5-measure lines to blank-verse 5-measure lines (excluding short lines like those of Berowne's praise of Rosaline, and the casket verses in the *Merchant of Venice*) in all the genuine and unmixed Plays, with the following result, showing, that however valuable the Ryme-test may be—as it is—when used jointly with other tests, it alone cannot be trusted to settle the right order of Shakspeare's plays.

Proportion of Ryme to Blank-Verse, 5-measure Lines.

Love's Labour's Lost	1 in .56
Midsummer Night's Dream	1:2
Comedy of Errors	3:02

Sketch Quartos.

Merry Wives	3:7
Romeo and Juliet	5:0
Henry V. (a pirated copy)	25:0
Hamlet	27:0

That the *Two Gentlemen* and *Macbeth* are brought next to one another, *Henry V.* put after *Henry IV.*, while *Richard III.* is after both, and *Cymbeline* only three places from it, of course proves the untrustworthiness of the test as a sole guide. But let no one think that it is, therefore, without very great value when used judiciously with other tests, regard being had to the nature of the Plays. Every Shakspeare student is deeply indebted to Mr. Fleay for his work at this and other tests; and that they will ultimately lead to the establishment of greater certainty as to the order of Shakspeare's Plays, we do not doubt. Professor ten Brink has just declared his agreement with Mr. Furnivall, in believing that the end-stopped line test is the most trustworthy general one. But, till the table of its results is produced, we can only accept the words of the New Society's Prospectus, that this test has "exceeding value . . . though, of course, it alone is not conclusive."

THE *Globe* took us to task the other day for contradicting a statement made by a contemporary about Mr. Gladstone, which has since been acknowledged to be inaccurate. But why is the press to play fast and loose with the private affairs of public or eminent persons? The *Globe* itself,

* Mr. Fleay desires us to state that his calculations are based on an incorrectly printed table, of which he has not had an opportunity of revising the proofs; and that the obvious precaution was not taken of separating the verse and prose scenes, and calculating from the former only.

for instance, has recently stated that the Lord Chief Justice's work on Junius is finished and will be out in September; this is, of course, utterly untrue. The Chief Justice is occupied with the correction of the proofs of his judgment in the Tichborne case; and the manuscript of the ACADEMY articles on Junius is in the state of readiness in which it was when the work was broken off by the Geneva arbitration.

In *Fædrelandet* for March 11, Dr. C. Rosenberg, the distinguished Danish writer, gives a detailed criticism of Mr. Gosse's recently-published volume of poems.

THE following extract from a letter written by one of the leaders of the conservative Brahma-Samāj, Rajnarain Bose, after reading Professor Max Müller's Lecture on Missions, in Westminster Abbey, will show that at present the conservative party of the Brahma-Samāj exercises a more powerful influence on the native mind than Keshub Chunder Sen and his more progressive friends:—

"It gives us great satisfaction to see that justice is done in the lecture to Babu Debendranath Tagore and the old Brahma-Samāj, a thing rarely done by European writers.

"If the Christian missionaries of our country acted up to the advice given them by the lecturer in the spirit of true religion, Christianity would be presented in a more favourable aspect to the natives of India.

"The perusal of the lecture gives rise to one reflection, which is, that the phenomenon of true believers in God, calling themselves followers of the true form of the old religion, is occurring in every country. The lecturer calls himself a true Christian; we call ourselves true Hindus; the theists of Persia, among whom the ex-Grand Vizier was one, call themselves true Mohammedans; but whether we call ourselves Christians, or Hindus, or Mohammedans, in the above sense of each of these terms, we all agree in the opinion that the essentials of religion are 'loving God and doing the works He loves,' and are therefore all one.

"Although we have not organised a party like Babu Keshub Chunder Sen (we are of opinion that true believers in God should not form themselves into a sect or party), yet we have been able to influence the general Hindu community better than he. The Dharma Sabha, or the Society of Orthodox Hindus, now called the Sanātan Dharma Rakshini Sabha, lately gave their opinion in favour of orthodox Hindus drinking city-water, and not losing caste thereby. They lately petitioned Government against Kulinism, and are thinking of allowing Hindus to visit Europe. This present liberal spirit of orthodox Hindus is owing partly to the effects of English education, and partly to the imperceptible influence of the old Brahma-Samāj, but more to the latter. The principal cause of the influence of the old Brahma-Samāj is its not cutting off all connexion with the old religion. Although some of us have done things very repugnant in the eyes of orthodox Hindus, we are not looked upon with such disfavour by the general Hindu community as Babu Keshub Chunder Sen and his party. Although Debendranath Tagore has renounced the sacred thread, and has not taken it up again, like some so-called progressive Brahmins; although I have introduced widow-remarriage into my family; and although Babu Satyendranath Tagore, C.S., is a practical follower of the principle of personal liberty of females, we have not ceased to be held in much regard by orthodox Hindus."

WITH reference to the publication, at the expense of the Government, of the *Fac-similes of National Manuscripts* of England and Scotland, to which we lately drew attention, it is gratifying to be able to state that the undertaking has met with ample support from the public. The demand for these volumes continues to advance, and a second edition is wanted. The sale of the Scottish series is especially satisfactory; the first edition of the first and second volumes being now exhausted. The last few copies of the first volume have been sold by a bookseller, who had secured them in time, at an advance of four guineas upon the price—one guinea—at which each was published.

THE second volume of *Registum Palatinum*

Dunelmense, in the Rolls Series of Chronicles and Memorials of Great Britain and Ireland, edited by Sir Thomas Duffus Hardy, D.C.L., will very shortly be published. It forms a portion of the earliest register extant belonging to the Episcopal Palatinate of Durham, commonly called "Kellawe's Register," because it contains the proceedings of the prelate, both lay and ecclesiastical, from 1311 to 1316, the period during which Richard Kellawe presided over the see of Durham. The original manuscript became the property of the Crown by the separation of the Palatinate and Episcopate of Durham, by an Act passed 6 Wm. IV., and was, with the other muniments belonging to the Palatinate, removed from the late Cursitor's Office in Durham to the Public Record Office in London in the year 1868. It abounds in striking and valuable materials illustrative of the general history of England, especially of the northern counties. An index to the first and second volumes will enhance the value of this new issue; but the preface to the third volume is delayed for publication in the second, which is in a forward state of preparation, and will complete the work.

It is stated that M. Henri de Vartebelle, whose death is announced, has left an unpublished biography of Charles X., which will be shortly published.

It is anticipated that there will be great excitement in Iceland this summer in duly commemorating the thousandth year jubilee of the colonization of the island. In strict conformity to history, the year 1873 would have seemed the more correct period for such a celebration, since it was in 873 that the first settlers, Ingolf and Leif, after a search of three years, found the sacred seat-posts (*setstokkr*), which they had brought with them from Norway, and thrown into the sea, when they first approached the shores of the island in 870. These venerated objects, after having been left to drift along with the waves and currents under the guidance of their tutelar deities, as was supposed, were traced by Ingolf and Leif to the fjord, subsequently known as Reykjavík fjord, where they founded the settlements which gave origin to the town of the same name.

AN interesting volume, under the title of *Facsimiles of Ancient Charters in the British Museum*, has lately been published by order of the Trustees of the British Museum, edited by the Keeper of Manuscripts, Mr. Bond. It contains twenty-three plates, representing seventeen charters in all, which are accompanied by exact copies in modern type. As in the recently issued *Facsimiles of the Palaeographical Society* (see ACADEMY, January 17), the autotype process of photographic printing has been employed, and the result in both cases proves how admirably it is adapted for the reproduction of manuscripts. All the nicer characteristics of the writing are brought out with perfect fidelity, with the further advantage that the facsimile may be considered as permanent as any ordinary print. The charters given range in date from A.D. 679 to 833, and, with one exception, which is a fine specimen of English, are written in Latin. They have been selected, as Mr. Bond states in his Preface, from those of the series preserved in the Museum which are at once the oldest and of worst condition, the immediate object of the publication being to reproduce in exact imitation, before it is too late, those originals which, from the fading of the ink and disintegration of the vellum, show most unmistakable signs of progressive decay. Most of the number formerly belonged to the Monastery of Christ Church, Canterbury, and, passing thence into the hands of Sir Robert Cotton, were transferred with the rest of his library to the British Museum. The names of the royal and other donors, with the actual or approximate dates, are as follows:—1. Hlothari of Kent, May, 679; 2. Oethilred, March, 692 or 693; 3. Suaebræd of Essex, June 13, 704; 4. Uuihtraed of

Kent, July, 700 or 715; 5. Berctuald, Archbishop, 693-731; 6. Aethilberht of Kent, February 20, 732; 7. Aethilbald of Mercia, 736; 8. Aethilberht of Kent, 740; 9, 10, 11. Offa of Mercia, 767, 779, 780; 12. Coenuulf of Mercia, 798; 13. Aethelheard, Archbishop, 805; 14. Coenuulf of Mercia, August 1, 811; 15. Wulfred, Archbishop, Osuulf and Beornthryth, 805-831; 16, 17. Ecgberht of Kent, 833, 838. It should be observed that No. 11 is plainly a copy of the eleventh century, and is only included because of its faded condition. No. 3, too, appears to be later by a century than the date it bears; while the year 833, assigned to No. 16, is deduced from the names of the witnesses, the charter itself being dated 773. Unlike the rest, which are grants of land to individuals or monasteries, No. 5 is a letter from Uuualdhere, apparently a bishop, to his metropolitan Berctuald, asking his advice as to whether he should attend a conference between the kings and magnates of Wessex and Mercia, to be held at Brentford. Among other points of historical interest, too, may be noticed the style assumed by Aethilbald in No. 7, viz.: "Rex non solum marcersium sed et omnium provinciarum quae generale nomine sutangli dicuntur;" and again in the subscription, "Ego Aetdiltalt rex britanniae." As regards the palaeographical value of the volume, there is force in Mr. Bond's remark, that "the variations in the style of writing of documents so nearly of the same age point to the prevalence of special forms in the different divisions of the island;" but to determine whether this was the case would require many more facsimiles than are given, if not more than are to be obtained. Original charters of so early a period are, of course, rare, as may be inferred from the fact that of the 1,369 documents of the kind given by Kemble in his *Codex Diplomaticus Aevi Saxonici* (to which this volume may well form an illustrative appendix) not more than 160 profess to be printed from extant originals. The great majority of these are now in the Museum, and the few reproduced in the present volume, which, fine as they are, are the most decayed, show how worthy the whole series is of being published in facsimile. If, too, their condition is deteriorating, the sooner this is done the better.

NOTES OF TRAVEL.

It is reported by the American papers that Dr. Bessels, during his recent Arctic voyage with Captain Hall's expedition, has conclusively proved the existence of an open polar sea, connecting the Atlantic and Pacific oceans, and has thus verified the earlier conjectures of Franklin, Kane, Hall, and Petermann. According to Dr. Bessels the tidal wave which washes Cape Hatherton on the north coast of Greenland comes from the Pacific Ocean. In Newman's Bay, near the polar entrance into Smith Sound, the tidal flow is regularly in advance of that in the more southern Polaris Bay. If the wave come from the Atlantic, it must be an equatorial current going north and south, and would in that case strike Polaris Bay before it could be observed in Newman's Bay. From Dr. Bessel's observations, it follows either that Greenland must be an independent island, washed by the Atlantic, or that the coasts of Greenland form the point of junction between the Atlantic waves and the currents coming from the Pacific and passing through Behring's Straits into an open polar sea—a conjecture which seems the more probable.

THE winter in Iceland has been more severe than any since 1822. The west coast has been invaded by quite unusual numbers of polar bears, unwilling visitors, drifted thither on floating ice from Greenland.

THE German Polar Navigation Society has bought a station on the island Averö, on the west coast of Norway; this harbour, named Kristvig, is commodious enough to protect all the largest ships of the Society, and will in future be the

starting-point for the German scientific expeditions to the Arctic Regions.

DR. KIRK writes to the *Times* that Lieutenant Murphy, in a note written from Mpwapwa, a place about ten days' journey from the coast, and dated January 20 last, says that he was then accompanying Dr. Livingstone's body, and expected to reach Bagamoio, a seaport, on or about the 14th ult. Captain Shelle, of the Austrian ship-of-war *Heligoland*, had proceeded to the coast, and would at once convey the body and Lieutenant Murphy's party to Zanzibar on their arrival. Lieutenant Cameron had set out for Ujiji to recover papers left there by Dr. Livingstone. Lieutenant Murphy had been in communication with him subsequent to the death of Dr. Dillon, and was sorry to find that great difficulties impeded his onward progress, owing to the antagonism of native chiefs and the desertion of many of his followers. Chuma, who for eight years accompanied the Doctor in his wanderings, had been into Zanzibar. He seems to place the position of Dr. Livingstone's death at the north of Lake Bangweolo, on or about May 4, 1873. He was probably on his way westward. A reply to the official telegram, regarding the disposal of the body on arrival, was anxiously expected.

THE *Times* of the 18th instant gives a summary of an important paper read by Mr. McKellar, of Fort William, on the gold mines of Lake Superior, which were first heard of in 1871. Mr. McKellar holds that these mines might be worked very economically, and that they would yield as large profits as those of Australia or America, if not larger. The difficulties in developing them are due to the unwillingness of the Indians to work till some settlement is effected with them, and to the absence of a line of communication between Lake Superior and the high lands.

THE weather appears to be the chief subject of interest in Greece at present. The weather, writes the Athens correspondent of the *Levant Herald* on the 17th ultimo, has again become extremely cold, and it is now snowing within the limits of the town with a violence and a continuity seldom, if ever, witnessed in Athens. This unprecedented severity of the winter has prevailed all over Greece. In many parts of the country the roofs of houses have given way beneath the weight of snow. In Atilla, the village of Idyllia, or Villia, has been completely buried in snow. So has, to a certain extent, the town of Thebes, where the Government has despatched in all haste a body of troops with money and food to help the discomfited inhabitants. In Calamata, the river Daphnon has been frozen for some distance. From Lamia they write that the river Sperchius has flooded the surrounding country to an unprecedented extent, doing great damage to the seed in the ground. We also hear that the islands of the Archipelago, generally noted for the mildness of their climate, have suffered from the severe cold. Syra and Corfu, where snow is hardly ever seen, are now completely snow-clad. The suffering, especially amongst the peasant and the poorer classes, consequent upon this sudden cold is very great. In Athens all articles of food have risen enormously: meat is now at 1 dracham the oke; charcoal has also risen from 15 to 50 leptas the oke. Barring, however, these temporary inconveniences and the damage done to the flocks of sheep, the snow is gladly welcomed by all as a sure token of a rich and abundant harvest of cereals, olives, and grapes. The same story reaches us from Crete, where the weather is very severe. Whole districts of the island appear to be threatened by the calamity which has befallen Bengal; the whole of Cydonia especially Keramia, and Assigonia, Selinos, and Kissamos, are suffering severely from famine. Communication in Crete is very difficult, owing to the want of bridges over the numerous and rapid rivers. Things are not, or rather were not, at the date of our advices, much better in Thessaly.

MANY shocks of earthquake were felt on and

after January 14, at Kharpoat, continuing for several days. The central point of the disturbance was the Mostar Dagh, twenty miles eastward of Kharpoat. The village of Sarakamush, situated at the foot of the mountain on the east side, was reduced to a heap of ruins.

News has been received by the French Geographical Society from the expedition to Terra del Fuego, under M. Pertuiset. The landing was effected on December 7 last, and the members of the expedition, armed to the teeth, at once proceeded inland in the direction of Cape Horn. Their first discovery was an exquisitely beautiful lake, from twenty to twenty-five kilometres round, covered with thousands of small birds, ducks, and geese. The party gave it the name of their leader. At its south extremity a group of Fuegians was discovered, all of whom escaped, with the exception of a woman and two children. In return for some presents the woman gave M. Pertuiset "a piece of tin from a box of sardines;" she was, adds M. Pertuiset, "belle pour sa race." The Fuegians appeared to be hostilely disposed according to last accounts. Only one native hut was discovered, lately abandoned; it contained nothing but dead rats.

The report of the expedition is accompanied by some details from the French Consul at Valparaiso, relating to the territory of Magellan. That territory includes all the southern part of Chili, from ocean to ocean, from the isle of Chiloe to Cape Horn. The climate is cold in autumn and winter, but in the other seasons either great heat prevails or violent west winds, blowing for whole days together, which render it impossible to get out of doors.

The Chilian colony of Punta Arenas, founded in 1843 in the peninsula of Brunswick, has been very flourishing for the last four or five years. Its proximity to Terra del Fuego will allow M. Pertuiset's expedition to find a refuge there in case of necessity. Its chief wealth is its mining industry; gold is found in the river in considerable quantities, and the supply of coal is very abundant. The Fuegians, as well as most of the natives of the islands in the Straits of Magellan, are savages; but the Patagonians, though nomads and hunters, faithfully observe their treaties. Their number is decreasing every day, but from what precise causes does not appear to be known.

WE recently mentioned that the Macao Coolie trade, which has long been a scandal to the civilized world, is to be officially abolished next week. The dealers in human flesh seem to be making the best use of the small time left for their detestable traffic, for a Hong Kong paper, just received, mentions that

"the Peruvian ship *Luisa Canevaro* has sailed from Macao with 736 coolies for Peru."

We are further told that

"the Governor has issued a notification requiring all coolie-brokers, without other means of subsistence, to leave Macao within three days after the 27th of March next, the day fixed for the entire abolition of the coolie trade. Those wishing to reside in Macao will be called upon to produce sureties for their good behaviour. The last number of the *Independente* has four full columns devoted to a lamentation in memory of the defunct coolie trade, interspersed by some vile abuse against English philanthropy."

LETTERS have been received at Augsburg from Dr. Zittel, dated January 30, and written in the Libyan desert, in which he gives a description of the districts near the oases of Kasr Dachel and Farafreh, to which he had proceeded in advance of the rest of the expedition, and accompanied only by Professor Jordan and a German servant. He had succeeded in the object of his special mission, which was to establish a water-depot in anticipation of the expected arrival of Dr. Rohlfs with the men and camels, and he intended to join the main expedition in its advance westward whenever the necessary preparations for its departure could be made.

THE Geographical Society of Berlin has received later news from Drs. Rohlfs and Ascherson, dated February 5. The caravan was about to cross the Libyan desert from Dachel to the oasis of Kufra, or Kufara. Its chief difficulty was the complete absence of forage for the fifty camels which Rohlfs had brought with him; not a blade of grass was to be found in the desert, and forage had to be fetched from Sint, and transported on the backs of animals. The escort which attended it across the desert arrived on the same day as the courier left with Rohlfs' despatches, and the travellers hoped to reach Kufra without further hindrance.

ACCORDING to a communication received direct by the editor of the *Cosmos* from Dr. Eduard Beccari, the new expedition which that distinguished oriental traveller is directing exclusively on behalf of the Museum of Genoa, is now about to penetrate into the interior of Sumatra, for the purpose of studying the local fauna. Dr. Beccari's exploration of the Aru and Celebean Archipelago has contributed much important information in regard to the animal and vegetable life of those insular groups, and he is so well known by his expeditions into the north-western districts of Borneo, that we may anticipate the most important additions to our knowledge of the fauna and flora of Sumatra from the expedition on which he is to proceed early in April, and for the prosecution of which the Genoese municipality have granted a sum of 15,000 lire. The traveller speaks encouragingly of the state of his own health and that of the expedition generally, and gives it as his opinion that excesses and imprudences in diet and modes of living are in general a more prolific source of illness than the unhealthiness of the air, and that suitable, good, and abundant food constitutes the best preservative against the attacks of fever, not even excepting quinine.

ATTEMPTS are being made, with some success, to introduce the tea-shrub into Penang. The *Gazette* of that colony states that the Alma estate, which is situated about fourteen miles from Penang, has decidedly gained a name in the province as being the first estate on which tea has been planted and successfully cultivated.

CORRESPONDENCE.

DR. SCHLIEMANN'S DISCOVERIES IN THE TROAD.

London: March 9, 1874.

I have read with the keenest interest Mr. Newton's report on Dr. Schliemann's excavations at Hisarlik; and I am happy to find such complete conformity between his judgment, based on the examination of the originals, and the impression left on my own mind by the sight of the photographs. After Mr. Newton's expression of opinion, there remains nothing more to be said as to the authenticity of the objects discovered, and the reality in the main of the results of the excavations, of which Dr. Schliemann's high character and reputation constitute an additional guarantee. It is only, therefore, to the character of the works discovered, their date, and the epoch of civilisation represented by them, that any further discussion can and must be directed.

Here also I entirely agree with all Mr. Newton's views. I believe that he was wholly in the right in using with regard to these objects the vague and elastic terms "pre-hellenic," and even "pre-historic," which are alone applicable. The similarity which he points out between them and the earliest antiquities of Cyprus, Rhodes, Santorin, and the Greek Archipelago generally, appears to me to be beyond a doubt, and full of fruitful results. My object in taking up my pen, therefore, is not to contest the views and the conclusions of the eminent English scholar, but rather to confirm them to the best of my power by completing them with some new considerations.

Now I am of those who believe in the historic reality of the siege of Troy. Not that I go for history properly so-called to the Homeric poems; as well might one expect to find the annals of the Carolingians in our French *chansons de geste* of the cycle of Charlemagne. But though poetry has given a wholly imaginary physiognomy to "l'empereur a la barbe fleurie," and exploits

which are absolutely fabulous, Charlemagne none the less remains a historic personage; and if his legend alone had survived the loss of authentic writings like those of Eginhard, yet criticism would have had to take account of it, and to regard it as a proof of the great deeds of the restorer of the Western Empire, as well as of the prodigious impression which they had left upon the minds of men. What is the historical element in the *Chanson de Roland*? Nothing but the fact of the death of Roland, Count of the Marches of Brittany, in an unlucky rear-guard encounter in the midst of the defiles of the Pyrenees. But it is this fact which gave birth to the epic by furnishing it with a subject which it has overlaid with rich ornament. The *Iliad* may be compared to the *Chanson de Roland*, and I hold that the same mode of reasoning applies to both poems. Perhaps there is not in the sublime songs which bear Homer's name one single word more of positive history than in the rude and grandiose *Geste de Theroude*; but we should no more have the *Iliad* if there had been no siege and no destruction of Troy by the Greeks, than we should have the *Chanson de Roland* if that disaster had not happened to Charlemagne's rear-guard in the Pyrenees.

The taking of Troy is one of the five or six primitive recollections of the Greeks which seem to refer back to real facts, and which, beneath the exuberant mythological vegetation in the midst of which they appear, yet give us a glimpse, in the night of the heroic ages, of the successive phases of a growing civilisation. Such are the foundations of the kingdom of Argos by the Achæo-pelasgic dynasty of Inachus, the substitution in its place of the new dynasty of Danaus, then the power of the monarchy of the Pelopidae, and, in another part of Greece, the Phœnician colony of Thebes. The Greeks themselves always recognised a special and distinct character in these events, and viewed them as marking the principal and decisive epochs of their primitive annals, of their prehistoric traditions. For the Trojan war in particular there is a remarkable unanimity in tradition, a unanimity too marked not to rest on a foundation of fact. And, above all, I am struck by the constancy with which, in the midst of the infinite divergence of the Greek heroic tales, the same space of time is maintained between the taking of Troy and the invasion of the Dorians—this latter being a perfectly historic fact—which is set down as less than a century later, and which opens the ages of history, as the fall of Ilion closes the ages of fable.

Moreover, it seems to me no longer possible at the present day to contest the existence of Troy and of the Trojan kingdom, in face of the evidence of Egyptian documents. Beyond all doubt we must recognise a predecessor of the Homeric Priam in the Chief of the Dardani (Dardanians) of Iluna (Ilion), and of Padasa (Pedaasus), who figures with the chiefs of Leka (the Lycians), of Masa (the Mysians), and of Akerit (the Carians), in the tale of the "Sallier" hieratic papyrus, preserved in the British Museum, among the confederates who came to the help of the Khitas or Hittites under the walls of Qadesh on the Orontes in the fifth year of Ramses II. The distinguished and lamented Vicomte de Rougé was the first to recognise the mention of the Dardanians and of Ilion, with that of other peoples of Asia Minor, among the adversaries of the Sesostri of the Greeks, in this poem of Pentaur, composed on the morrow of the events, and engraved on the walls of the temples of Luxor and Carnac, as well as written on the fragile leaves of papyrus which have passed through so many centuries to find a refuge on the banks of the Thames. All Egyptologists now admit the interpretation given by de Rougé, and we may consider it as henceforth a permanent gain to science. There was therefore, in the 15th century before the Christian era, a kingdom of the Dardanians, one of whose principal towns was Ilion, a kingdom which ranked among the most powerful of Asia Minor, and which sent

its warriors into Syria to do battle with the Egyptian troops for the defence of Asia. This squares admirably with what Greek tradition says of the power of Troy, and with the two limits between which it ranges the date of the destruction of this great city, that is, according to different estimates of the length of a generation, in the 12th or the 11th century.

I believe then in the reality of the existence of Troy, and in the fact of the Trojan war. I should not even venture to deny absolutely the correctness of the name of Priam, preserved by tradition as that of the last king of Troy. There are very good reasons, to which I shall take another occasion to advert, for believing that the Trojans, Dardanians, or Teucrians spoke, like many other populations of Asia Minor, a language very closely allied to the Greek. The form of the name Priam, therefore, has nothing improbable in it, and the memory of the people has oftentimes preserved certain real names, while making them the centre of purely fabulous traditions. Certainly the reader of the legend of the ring of Gyges, or the tale of King Candaules and his wife, as told by Herodotus, was fully justified in considering Gyges a wholly mythical personage; nay, the principles of rigorous criticism seemed to render such a view even necessary, until the day when the name of Gugu, King of Ludi (Gyges, King of Lydia) was read in the Assyrian prism of Assurbanipal, as that of a real prince contemporary with the Ninevite monarch. After this striking instance, it is well to beware of advancing with too rapid steps in the path of negation.

But it is precisely because I hold the taking of Troy a real event, to which may be assigned, if not a fixed date, at least an approximate period, and a determinate place in the succession of the primitive phases of Greek civilisation; it is, I say, for this very reason that I cannot, from the archaeological point of view, admit Dr. Schliemann's theories respecting the objects which he has discovered, and connect them with the city taken by Agamemnon. I see in them—and I think I may say that my view is shared by Mr. Newton—objects much more ancient, belonging to a stage of culture less advanced than was assuredly that of Homeric Troy. The earliest date assigned by the Greek writers for the taking of Troy is the beginning of the 12th century; the most recent, which Menander claimed to have found in the Tyrian annals, which he had certainly consulted, and from which he had made very accurate extracts, the end of the 11th century, the age of Hiram and Solomon. We cannot suppose the fall of Ilion more ancient; for in the 15th century we saw the Dardanians of Iluna fighting against the Egyptians, and at the end of the 14th century, or the beginning of the 13th, under the reign of the pharaoh Ramses III., in the sculptures of the palace of Medinet-Abou, the Teucrians still appear as one of the most powerful peoples on the coast of the Mediterranean, in close alliance with the Pelasgic nations, and possessing a large fleet. Now it is to me impossible to admit that in the 12th or 11th century before the Christian era, this powerful people, or even any people of Asia Minor, could still have been in the really barbarous state disclosed by the remains discovered by Dr. Schliemann. The Teucrians figured in the bas-reliefs of Medinet-Abou are already much more advanced than those whose traces have just been discovered.

As Mr. Newton has remarked, all the objects met with at the greatest depth in the excavations of Hisarlik have their counterparts in the antiquities before collected at Cyprus, Rhodes, Santorin, and generally in all parts of the Greek Archipelago. The collections of the British Museum, the richest in Europe in this class of antiquities, furnish an infinite number of such resemblances. Mr. Newton has pointed out some, and I could add many more. But I will confine myself to pointing out the close analogy, in the mode of representing animals employed as orna-

ments, between the Trojan spindle-whorls, and the most primitive among the ancient engraved stones of the Archipelago, in which the natural form of the pebble, a lentil irregularly flattened, has been preserved without any attempt to give it artificially a more regular form. The British Museum possesses an important series of these gems, and it will be easy to establish the analogy which I am pointing out with those in which the engraving was produced by repeated friction with a pointed flint before the introduction of the wheel, an instrument of oriental origin, known at a very early date at Babylon, but which only appeared among the Greeks at a later date, and whose first use was attributed by Hellenic tradition to Rhoecus.

We find again, that in whatever locality they have been dug up, the objects which admit comparison with Dr. Schliemann's treasures are always among the most primitive of that locality. The town whose remains have been discovered beneath the hill of Hisarlik belonged to the very earliest period of the civilisation which grew up round the basin of the Aegean Sea, and succeeded the age of the exclusive use of stone.

Among the remains found by Dr. Schliemann stone instruments are still very numerous; their use was far from abandoned, but it was combined with that of metals—gold, electrum and copper. It has been chemically proved that in the treasures of Dr. Schliemann the copper is always pure, without a trace of tin alloy; a very important fact from a chronological point of view. European and Asiatic Greece is one of the very few regions where the existence of an age of pure copper previous to the bronze age is capable of positive proof. Dr. Schliemann finds it at Troy; M. Gorceix has proved its existence at Santorin beneath the bed of pumiceous tufa produced by the last eruption of the great central volcano of the island; and lastly, Mr. Finlay and myself have recognised traces of it in Attica. The various successive phases of metallurgy were developed in a peculiar manner in Greece; the Aryan tribes which peopled that country had scarcely any knowledge of metals whatever on their arrival. This is proved by their language, in which the names of metals are not those which are found among other peoples of the same race, and are common almost to all, but are for the most part derived from a foreign source. Thus χρυσός is clearly Semitic, *khuratz*, and was undoubtedly introduced by the Phœnicians. No satisfactory Aryan etymology has been found for χαλκός, while this metal is naturally connected—and such is the view even of such a severe philologist as M. Renan—with the Semitic root *khalak*, meaning the metal which is worked with the hammer. Thus the very origin of the word χρυσός seems an index of the source from whence the Graeco-Pelasgic populations received the knowledge of bronze alloy, after a first and purely native age of work in pure copper. It is the civilisation of this copper age that Dr. Schliemann is bringing to light in the Troad, as MM. Fouqué and Gorceix have disinterred it from the old volcanic deposits of Santorin; but we must necessarily assign to it a very high antiquity, and it brings us back in the course of the centuries to a period far earlier than that of Homeric Troy.

For the most part Dr. Schliemann's discoveries represent precisely the same stage of civilisation as the villages swallowed up by the great eruption which, before even the semi-historic epoch, and the establishment of the Phœnicians in the Isle of Strongyle or Thera, ended the period of activity of the primitive volcano of that island, and preceded by a very short time the gigantic subsidence of its central tract. The buildings are in the same style, of stones roughly hewn, and joined with mud instead of mortar. We find in both stone instruments mixed with those of pure copper, and also the same rude carvings, formed by rolling up a gold wire, irregularly shaped by means of the hammer. Lastly, the pottery, without paintings, but having the surface glazed by means of a stone

polisher worked by hand (the British Museum possesses specimens of such instruments from Camirus), and decorated with compartments, or *chevrons*, cut in the paste while still fresh, have been met with alike in both places. But this is the only kind of pottery which occurs among Dr. Schliemann's treasures, while at Santorin it is found in conjunction with first attempts at a native painted pottery, consisting in a peculiar type of *oinochoe* with two great eyes near the mouth, carvings on the two sides where the top spring of the handle begins, a collar at the base of the neck, the whole roughly drawn in brown; and lastly, two women's breasts, projecting from the upper part of the body of the vessel. The general design strongly recalls that of the Trojan vases, which are merely barbarous attempts to represent the human countenance, but in which Dr. Schliemann and M. Burnouf think they see owls' faces. These first attempts at painted pottery, of which, more fortunate than Mr. Newton, I can speak from personal examination, seem such as to incline one to believe that the prehistoric villages of Santorin belong to an epoch a little later than that of the town in which Dr. Schliemann would recognise the Troy of Priam, and to a stage of civilisation already somewhat more refined. This also appears to me to follow from the circumstance that the inside of the rooms there was coated with coloured plaster, while nothing of the kind as yet appears in the buildings discovered at Hissarlik. Now M. Fouqué, my fellow-traveller to Santorin, relying on a series of geological considerations, and also on historical grounds, thought that he might place the eruption which covered the prehistoric villages of Santorin at from 2,000 to 1,800 years before the Christian era. So we have now gone back far past the Troy of Homer and Priam.

If the ruins covered by ancient volcanic deposits at Santorin present specimens of the most ancient painted pottery of the Archipelago, together with the continuation of the previous ceramic ware, such as Dr. Schliemann has met with at Hissarlik, they have also furnished examples of a third class of pottery, vases decorated with paintings, of much finer earth, and far more perfect execution, than those which we must assign to native workmanship. In these vases we have the models, brought by commerce from beyond the seas, which the islanders rudely imitated, and the models are found in the midst of the same dwellings as the imitations of them. Their ornamentation and shapes are very peculiar, particularly the funnel-shape, like a greatly elongated cone turned upside-down, with a little round handle at the side of the mouth. We have here precisely the vases which in the paintings of the so-called "Hoskins" tomb at Thebes, the inhabitants of the country of Kefta are bearing as a tribute to pharaoh Thouthmes III. (17th century B.C.). Now the country of Kefta is not, as was at first believed, Cyprus or Crete; it is important that an incorrect notion—the reappearance of which I notice in some of the discussions to which the excavations of Dr. Schliemann have given rise—should not be allowed to go unchallenged in connexion with this question. The bilingual decree of Canopus gave us, some years since, the recognised Greek translation of the Egyptian name of Kefta; it is Phoenicia. The vases of foreign workmanship found in the prehistoric villages of Santorin associated with native pottery—painted or simply polished, with incised drawings—are, therefore, properly Phoenician vases. And indeed they are, in all respects, similar to the painted pottery of the country of Moab, fragments of which are preserved in the British Museum and the Louvre, or to the priceless remains of vases of the same kind with Phoenician inscriptions, discovered by Mr. Layard at Nimroud, which may be seen in the cases of the Assyrian room at the British Museum. Hence I conclude that the buried villages of Santorin date from the times of the earliest relations of the inhabitants of the islands of the Archipelago with the Phoenicians, from the very

beginning of the voyages of the Sidonians, whose culminating epoch, as I have elsewhere sought to prove, is contemporaneous with the reign of Thouthmes III. in Egypt. The bulk of the objects dug up by Dr. Schliemann, in which no imitation of the painted potteries of Phoenicia is found, is a little more ancient.

One more circumstance, partly connected with this, confirms the very high antiquity of the remains of Hissarlik, and scarcely allows us to bring them lower down than nineteen or twenty centuries before our era; namely, the want of any trace of influence, however distant, of the arts of Egypt and Assyria. The inscriptions of Thouthmes III. attest in formal terms the frequent relations which existed in the reign of that prince between Egypt and the inhabitants "of the isles and the coasts of the Great Sea," that is, the Mediterranean; relations of which we have material proofs in the great number of Egyptian *scarabaei*, bearing the first name of Thouthmes III., which are met with in the isles of the Archipelago. A little later, in the time of Ramses, the instances of contact, both hostile and pacific, were still more frequent; the Dardanians or Teucrians in particular had direct and repeated relations with the Egyptians, and it would be improbable that no trace of such relations should have been left in the industrial products of this people, had the objects discovered at Hissarlik been subsequent to this period of intercourse with Egypt. Nay more, if the remains of the Troy of Priam, of the city destroyed during the 12th century of our era, had been discovered by Dr. Schliemann, these remains would certainly have borne the imprint, not only of Egyptian, but also, and above all, of Assyrian influence. The Empire of Assyria was then in the first phase of its power, and it was towards Asia Minor that its warlike energies were principally directed. We have positive evidence of this in the inscribed prism of King Tiglathpileser I., who lived at the end of the 12th century: on that monument he recounts his numerous campaigns in almost all parts of Asia Minor, how he warred there against the Muskaya (Moschians), then occupying a great part of Cappadocia; how he made a first expedition into the country of Khurkie (Corycus) or Cilicia Trachea, penetrating into the mountains beyond Selgu (Selge in Pisidia), then a second more to the north, beginning at Pontus, where he conquered the people of Kumani (Comana), afterwards proceeding to Karusa (Carissa), gaining the Canton of Asia (which is undoubtedly the Phrygian Asia proper) and the country of Asani (Aezani), and lastly reaching the district of Musri, further to the west, which may very well be Mysia. Such details of information as these, read in this cuneiform inscription, give great value to the tradition preserved by Herodotus of the establishment of an Assyrian dynasty in Lydia precisely in the 12th century, and all the more so as the names quoted by this tradition are genuinely Semitic names, and as Lydia is one of the principal seats in Asia Minor of the worship of the god Sardon, the Samdan of Assyria. But from all this it appears a necessary conclusion that, in the true remains of the Troy destroyed by the Greeks in the 12th century, a portion at least of any objects found must have borne that stamp of imitation of Assyrian art which is so striking in the sculptures left by the native populations of Asia Minor before the foundation of the Ionian cities on certain rocks in their country, as at Nymphri near Smyrna, and at Ghiar Kalessi.

The antiquities discovered in the isles of the Archipelago will furnish me with a last comparison before ending this somewhat long letter. I would speak of those statuettes in Parian marble, representing nude female forms, with the arms crossed beneath the breasts, instances of which are found everywhere in the most ancient tombs of the Cyclades, and of which again the British Museum possesses a rich collection. They are the almost shapeless works of a more than barbaric art; but,

in spite of the rudeness of the work, it is impossible to mistake in them an imitation of those figures of the Asiatic Venus, in the same attitude, which are met with in such numbers from the banks of the Tigris to the island of Cyprus, over the whole extent of the Chaldaeo-Assyrian, Aramaic and Phoenician world. Its first type is the Babylonian Zarpanit or Zirbanit, frequently represented on the cylinders, and terra-cotta images of which may be seen in the Assyrian basement-room at the British Museum. The statuettes of nude female figures from the Cyclades seem, therefore, to be rude copies made by the natives at the very birth of their civilisation, in imitation of the images of the Asiatic goddess brought by the Phoenician merchants; and in a terra-cotta figure which I myself picked up in a pre-hellenic tomb at Santorin, and which is now in the British Museum, I think I recognise oriental workmanship, though in a more advanced stage of art. I should therefore regard it as one of the models brought from Asia, and imitated in the marble figures above described. And, however barbarous these latter be, they are almost true works of art compared to Dr. Schliemann's Trojan idols; which are still more rude, still more shapeless, and appear to me the first attempts of native populations at representing the human figure, before being guided by the models of the more experienced peoples of Semitic Asia.

I have here principally rested my case on the comparison of the antiquities of Santorin, because in this island a great geological convulsion determines the division of the various epochs, and allows us to establish a chronology, which it is almost impossible to do with the same precision in the case of Cyprus and of Rhodes. But, to justify my view of the antiquity of the objects discovered by Dr. Schliemann, I can bring forward yet other points of comparison, taken from the representations of the peoples of Greece, of the Archipelago, and of Asia Minor, in Egyptian monuments of the 15th and 14th centuries before the Christian era, as well as from the antiquities of Mycenae. This I shall venture to ask your permission to do in a second letter.

FRANÇOIS LENORMANT.

SHAKSPERE'S "RUN-AWAYS- EYES."

3 St. George's Square: March 16, 1874.

An enormous amount of needless difficulty has been made over this comparatively simple passage by so-called emenders of Shakspeare. These folk have first created the puzzle, and then puzzled themselves and their readers over it. Juliet says:

"Spred thy close curtain, Love-performing night,
That run-aways eyes may wincke, and Romeo
Leape to these armes, vntalkt of and vnscene."

These "run-aways" are therefore beings who can see and talk, who are on the look-out for material for scandal, and who'll give tongue freely as soon as they spy it. Was the word "runaway" then ever used in Elizabeth's or James's time as equivalent with the gadabout, prier, or runagate, or vagabondizer, that Juliet alludes to? It was. Cotgrave, in 1611, gives—

"Fugitif . . . gadding, flitting, runneaway, runagate, quickly gone, of no continuance."

"Roder. To roame, wander, vagabondize it, rogue abroad, run up and down, flit here and there, trot all the country over."

"Roder les rues. To jet, walke, trot up and down the street (especially nights), to see the town served."

"Rodeur: m. A vagabond, roamer, wanderer, street-walker, highway-beater; a rolling stone, one that does nought but run here and there, trot up and down, rogue all the country over."

"Vagabond. A vagabond, roamer, earth-planet, wandering idlesbie, ranging or gadding rogue."

"Trotteur . . . an earth-planet; a roamer, gadder, wanderer up and down."

"Een Vagabondt, a Vagabond, or a Runnegate." (Hexham, 1660.)

Shakspeare's runaways, runagates, or runabouts, were the *rodeurs des rues* with a different object, men who'd leave no young lovers 'vntalkt of and vnscene,' while the light lasted.

F. J. FURNIVALL.

Trinity College, Dublin : March 16, 1874.

In Mr. Furness's *Romeo and Juliet*, the notes upon this chief textual *crux* of the play occupy twenty-eight closely printed pages. Warburton (1747) noticed that in *Merchant of Venice* (II. vi. 47) night is called a runaway. But I do not see that any of the commentators have noticed that the passage in the *Merchant of Venice* is a clear echo of the passage in *Romeo and Juliet*. First, it is a transposition of the thought. Compare

"Lovers can see to do their amorous rites
By their own beauties; or, if love be blind,
It best agrees with night," R. & J.

with

"I am glad 'tis night, you do not look on me,
For I am much ashamed of my exchange;
But love is blind, and lovers cannot see
The pretty follies that themselves commit."

M. of V.

Secondly, it is an echo of the words. Compare

"Spread thy close curtain, love-performing night,
That runaway's eyes may wink," R. & J.

with

"For the close night doth play the runaway."

M. of V.

The reading "Runaway's," or "Runaways," is thus confirmed. EDWARD DOWDEN.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Mar. 21,	1 p.m.	Sale of old China at Sotheby's.
	3 p.m.	Mr. Newton on "Ephesus." II. Royal Institution.
	"	Crystal Palace Concert (Joachim).
	"	Saturday Popular Concert. (Hallé, Néruda).
	8 p.m.	First Night of <i>Queen Mab</i> at the Haymarket.
MONDAY, Mar. 23,	"	First Performance at the Criterion Theatre.
	"	M. Gounod's Concert.
	1 p.m.	Sale of old English China at Sotheby's.
	8 p.m.	Monday Popular Concert (Hallé, Joachim).
	8.30 p.m.	London Institution. Medical. Geographical.
TUESDAY, Mar. 24,	3 p.m.	Royal Institution: Prof. Tyndall on "Physical Properties of Liquids and Gases."
	8 p.m.	Mr. Leslie's Choir, St. James's Hall. Anthropological.
	"	Institute of Civil Engineers: Continued discussion on Gun-carriages, &c.
	8.30 p.m.	Medical and Chirurgical.
	1 p.m.	Sale of the late Tipton's Engravings at Christie's.
WEDNESDAY, Mar. 25,	"	Sale of Coins at Sotheby's.
	"	Sale of Hon. Mr. Forbes's collection of China, &c., at Christie's.
	"	Sale of Mr. Koekkoek's Pictures at Foster's.
	7 p.m.	London Institution.
	8 p.m.	Society of Arts: Lieut. Cole on "The London International Exhibition of 1874." Geological. Archaeological. Association. Royal Society of Literature.
THURSDAY, Mar. 26,	"	First Philharmonic Concert.
	1 p.m.	Sale of Engravings, &c. at Christie's.
	"	Sale of Engravings at Sotheby's.
	3 p.m.	Royal Institution: Prof. Williamson on "Ferns and Mosses."
	6 p.m.	Philosophical Club: Willis's Rooms.
FRIDAY, Mar. 27,	8 p.m.	British Orchestral Society.

SCIENCE.

JOHANNES BRANDIS AND THE CYPRIAN INSCRIPTIONS.

Johannes Brandis, *Ein Lebensbild*. Von Ernst Curtius. (Berlin, 1873.)

DR. JOHANNES BRANDIS, the worthy son of a most worthy father, Professor Brandis, of Bonn, died on the 8th of July, last year, regretted not only in his own country, but by his numerous friends and acquaintances in England, France, and Italy. Though he died at the early age of forty-three, he may have honestly felt *non omnis moriar*, for he left behind him not only his published works, but likewise, though not yet finished, the manuscript of an essay on the decipherment of the Cyprian Inscriptions, which will not soon be antiquated. That last work of his has since been published in the *Monatsberichte* of the Berlin Academy, and the same kind hand which superintended its publication has now given us a sketch of the life of Brandis, for which all who knew the excellent man, and the excellent work which he did in his short life, and in spite of many difficulties with which he had to struggle, will feel most truly grateful. That sketch is written by a friend, by Professor Ernst Curtius, the author of the best German history of Greece; but though written with all the warmth of friendship, and with an intense feeling of the loss he himself had suffered, there is not one word in it that could be called exaggerated, not one judgment to which those who knew Brandis best would not readily subscribe.

Brandis was born in 1830, at Bonn, then a rising and flourishing university, an advanced post of German culture, as Curtius calls it, intended to do the same work for the newly-acquired Rhenish provinces which Strassburg is meant to achieve at present in Alsace. The men who went there as professors were conscious of the greatness of the task entrusted to them, and such names as Niebuhr, Bethmann-Hollweg, Nitsch, and Brandis, show that Germany had then given her best sons to act as pioneers in the intellectual reconquest of the half-frenchified Rhineland. The elder Brandis, the father, who in 1816 had been Secretary of Legation under Niebuhr at Rome, and who in 1837 migrated for several years with his family to Athens, to act as an unofficial Minister of Instruction under King Otho, maintained the traditions of Niebuhr's school at Bonn, so that Johannes, his third son, imbibed the spirit of that school from his earliest youth. During his stay in Greece, though a mere boy, his mind was impressed with the reality of Hellenic greatness, and under such guides as his father and his tutor, Ernst Curtius, he soon acquired not only a knowledge of Greek and Latin, but, what is far more important, a real love of classical literature, which never left him during his whole life. As a student at Bonn he was again brought together with his former tutor, Ernst Curtius, who was then staying there as private tutor to the Crown Prince of Prussia. He there attended the lectures of Welcker, Ritschl, Bernays, and others, and very soon, attracted by a prize offered by the University for the best essay "On the Statements of Ancient Writers on Assyria, compared with the recent Discoveries of

Botta and Layard," devoted himself with great ardour to the study of Assyrian antiquities. He gained the prize—at least half of it—and published his essay under the title of *Assyriarum rerum tempora emendata*, in 1852. He then went to Berlin, partly to teach at one of the gymnasia, partly to attend lectures in the University. From there he went, in 1854, to London, as private secretary to Bunsen, who was then finishing the last volumes of his work on Egypt, and wanted the assistance of a young scholar to collect for him the newly-discovered materials for settling the chronology of Babylon and Assyria. Though Bunsen's recall in June, 1854, put an end to this engagement, Brandis had during his short stay in London derived great advantage both from his intercourse with English scholars, and from a study of the original monuments of Assyria in the British Museum. The fruits of these researches were published, in 1856, in his work *On the Historical Results of the Decipherment of the Assyrian Inscriptions*, the first attempt of a German scholar at showing the solid character of the discoveries made by Rawlinson and others in the study of the Assyrian cuneiform language and literature. Brandis then established himself at Bonn as a privat-docent, at the same time superintending the education of several young gentlemen who lived as boarders in his father's house. In 1857 he published an academic program, *De temporum graecorum antiquissimorum rationibus*, an essay which Curtius considers of permanent value, as establishing for the first time the origin of the lists of the ancient kings of Greece from local traditions kept up in different Greek towns. At that time his university career was cut short by his appointment as private secretary to the Princess of Prussia. Many of his friends regretted his accepting such a position, but owing partly to the highminded character of the Princess, partly to the iron will of Brandis himself, the current of his scientific work, though narrowed, was never entirely interrupted by his official duties. He sur-rendered his Assyrian researches, because he felt that, not being an Oriental scholar, he could not advance in them independently; but he began to devote all his leisure to a careful examination of the influence which Assyrian civilisation had exercised on Asia and Europe. Concentrating his attention on the ancient arts of measuring, weighing, and coining, he arrived at results as unexpected as they were certain. During ten years, whether at home, or travelling in France, Spain, Italy, and England, he worked at tracing the migrations and modifications of the Babylonian weights and measures on the Asiatic continent, and he collected every remnant of early Asiatic coinage that was to be found in public or private collections. The results of these researches are laid down in his great work on measures, weights, and coins*—a work which, as he said himself, attracted more attention in England than in Germany, and secured to him, once for all, a respected position among scholars and antiquaries.

* *Das Münz-, Mass-, und Gewichtswesen in Vorderasien*. Von J. Brandis. (Berlin, 1866.)

More than 5,000 coins are carefully described in that book, and this alone would secure to it a permanent value. He hoped to follow up the history of these early arts from Asia and the isles to the continent of Greece, and while engaged in these researches, the discovery of the Cyprian inscriptions—or, rather, of the first bilingual Cypro-Phoenician inscription—at once roused his liveliest interest. Many of the threads that bind Europe to Asia and Africa passed through Cyprus, many riddles in the earliest history of the world must find their solution there. Brandis came to England last summer, and he saw at once that the spell of the Cyprian inscriptions had been broken by the clever guesses of Smith and Birch. They had established the value of thirty-three letters, they had proved that the language of the inscriptions was Greek. The Brandis carried on their work, and in paper published after his death, he fixed the value of the remaining letters, he showed the peculiar character of the Greek dialect spoken in Cyprus, and by a translation of the large inscription of Idalion, he proved that it contained a lease between a landlord and a farmer, fixing the amount of corn which the farmer was to retain for himself. Soon after his return to Germany he died at Linz. He had accompanied the Empress of Germany to the Vienna Exhibition, and while looking forward to a quiet summer in his own villa on the Rhine, the thin thread that bound him to this life snapped. His death was no surprise to his friends. They knew that for years he had lived under the shadow, or, we should rather say of him, in the very light of death. They knew, and he knew, that a heart complaint from which he suffered might terminate his life and his labours at any moment. This feeling gave a kind of solemnity to his life, but it never marred the joyousness of his character. Few men enjoyed society, in the best sense of the word—a free intercourse with friendly spirits and intellectual peers—more than he did. A Symposium, more or less Platonic, was the place to see him and appreciate him. All that is gone, but while it lasted it was full of happiness. "Every life," as Ernst Curtius truly says, "remains a fragment, whatever its length in years; while even a short life, like his, has a completeness of its own, when it is held together by a constant purpose, and directed to nothing but the noblest aims."

A few more words on his posthumous essay. Short as this paper is, it establishes facts of the greatest importance. It shows that the alphabet of Cyprus is not Phoenician, but an independent offshoot of a cuneiform alphabet, therefore ultimately coming from Assyria, where we are told that inscriptions written in the Cyprian alphabet have lately been discovered. (See *ACADEMY*, March 7, Letter from Mr. Sayce.) Whether the few letters found on some of Dr. Schliemann's Trojan antiquities show more similarity to the Cyprian than to the Phoenician alphabet, must for the present remain an open question, considering how like several of the Cyprian letters, as pointed out by Dr. Brandis, are to Phoenician letters. This essay further shows that the language of the inscriptions has those very peculiarities which Greek

grammarians ascribed to the Greek dialect of Cyprus, some of them so incredible that but for the evidence of these inscriptions no one would have believed in them. This is a subject which deserves the greatest attention on the part of comparative scholars. Who would have believed that Hesychius was right in stating that *καί* in the Cyprian dialect was *κάς*? Yet, wherever *καί* occurs in these inscriptions, it is *κάς*, except in one place where we find *κα*. Bopp identifies *καί* with Sk. *ket*, which means, if; but in order to bring *κάς* and *καί* together, we shall have to admit an original form *καρί*, the Sk. *kati*, formed from the base of the interrogative pronoun *ka*, like *iti* from the base of the demonstrative pronoun *i*. The phonetic changes would be analogous to *φαρί*, *φής* or *φής*, for *φάς*, and to *γέλα* or Lesb. Aeol. *γέλαι*. Thus *καί* would originally have been an interrogative particle, meaning how, or how much, a very primitive, though by no means unnatural way of connecting two sentences, and afterwards two words. In modern Sanskrit *kimka*, (originally meaning, and what? cf. *quodque*) is a very common conjunction. Bopp also derives both *que* and *re* from the root of the interrogative pronoun *κίς*, *τίς*, quis, a conjecture which is confirmed by the Cyprian form *κι* in *τάκι* for *τάσε*. "He came and he spoke," would therefore have been expressed originally, "He came, what next? he spoke," a clumsy proceeding, no doubt, yet not more clumsy than other expedients which language had to adopt for similar purposes.

Who would have believed that dialectic variety could go so far in Greek as to place *go* and *gos* by the side of *πρό* and *πρός*? Yet these forms occur in the Cyprian inscriptions, and must be explained by the analogy of *πори* (Cyprian *pali*) for *πρός*, as far as the loss of *ρ* is concerned, and then by softening of *π* into *β*, and transition of *β* into *γ*. The softening is the most exceptional process, but it occurs again, in *gotolis*, the Cyprian form of *πρόλις*, *βοτολις*, *γυτολις*, in *αυι* for *ἀπό*, in *καγος* for *κίπους*, in *αγοί* for *ἀκού*, and in *ἐνέτασαν* for *ἐπενέτασαν*. Seeing this softening of the tenuis in the Cyprian inscriptions, we can now understand how ancient lexicographers came to mention *ἐντροπασσθαι* as a Cyprian form for *ἐπιστρέφειν*. The curious point is, that the Cyprian inscriptions contain likewise cases where the media has become tenuis, as in *kasikintos* for *κασιγνήτος*, *apas* for *ἀπάθ*. Here, however, further researches may bring out more minute distinctions in the phonetic powers assigned to the Cyprian consonants and vowels.

The grammar of the inscriptions is clearly Greek, and in cases where we have at present some irrational forms, we must wait for better readings. The nature of the alphabet requires a more careful investigation, particularly the influence of the vowels on the consonants, and again the coalescence of the inherent with the written vowels. But even now we can arrange a number of grammatical forms without much difficulty. We have *basileus*, *basileos*, *basilei*; we read *paidēs*, *paidou* (*παίδων*), *paisi*, *paidas*. For bases in *o*, we find Nom. -*ος*, Gen. -*ου*, Dat. -*οι*, Acc. -*ο*, or -*οο*; Plur. Dat. -*οις*; Acc. -*οος*. Feminine and masculine bases

in *a* appear in Nom. -*ας*, fem. *a* (voc.); Gen. -*αν*, masc., *ας* fem.; Dat. -*αι*, Acc. -*α*; Acc. Plur. -*ας*. As neuters we have *ta* = *ρα*, *pata* = *πάρα*, *ta epi* = *τὰ ἐπι*.

Verbal forms are not so frequent, yet some of them deserve to be mentioned, such as *emi* = *εἰμι*, *tiitemi* = *τίθημι*, *eki* = *ἐχει* and *ἐχειν*, *ekni* = *ἐκρί*; *ekiossi* = *ἐχῶσι*. There are optatives, such as *agoioi* = *ἀκούοι*, *kinoian* = *κινῶν*; futures such as *ounisi* = *ὀνήσει*, and aorists like *kateslas* = *κατέστασε*, *euenetasan* = *ἐπενέτασαν*.

There is no doubt much left to be done before these inscriptions can be read even with that degree of accuracy which has been reached in the Persian cuneiform inscriptions. There will be mistakes to correct, as, for instance, in the case of the name of *Pythagoras*, which Mr. Smith thought he had discovered in the Cyprian inscriptions, but which turns out to be *Philagoras*. Yet a good beginning has been made. Champollion, when he died at the age of forty-one, called his Hieroglyphic Grammar his *carte de visite à la postérité*. We cannot ascribe the same importance to the essay on the Cyprian Inscriptions which Johannes Brandis left at his death; yet we feel that it also will be a *carte de visite à la postérité*, and that whenever Cyprian antiquities are studied, the name of that ingenious and ingenuous young scholar, who has just been taken from us, will be remembered with regret and well-deserved respect.

MAX MÜLLER.

Feng-Shui; or, the Rudiments of Natural Science in China. By Ernest T. Eitel, M.A., Ph.D., of the London Missionary Society. (London: Trübner & Co., 1873.) "WHAT is Feng-Shui?" asks Mr. Eitel, both at the beginning and at the end of his work. Basil of Glemona, in his dictionary, published at Paris, in 1808, under the name of De Guignes, gave to this question the following answer: "Bona vel mala vis influens, quaedam superstitio in eligendo situ fortunato ad aedes extruendas vel cadavera humanda." This definition is confirmed by Mr. Eitel; and it is true that the main object for which Feng-Shui is employed is to make a happy choice of an abode both for the living and the dead. But Feng-Shui is not confined to this; it embraces a vast collection of rules and of principles relating to the Chinese notions of the order and constitution of Nature. This is what Mr. Eitel has undertaken to explain.

The author divides his work into four sections—the laws of Nature (*Li*); the numerical proportions of Nature (*Su*); the breath of Nature (*K'e*); Nature's forms of appearance (*Ying*). He owns that this classification is not in use in native Chinese books; but he states that they all mention these four principles. Nobody will blame him for having made use of the plan which afforded the best opportunity for explaining the system as a whole, especially as the idea of this plan is supplied by the preface of a Chinese work (page 9). But perhaps he does not sufficiently explain the reason why this fourfold plan is generally absent from the native treatises. He tells us (page 77), that Feng-Shui is divided into two schools, those of Foh-Kien and Kwang-Si, the former being specially devoted to the first two

divisions (Li and Su), the latter to the remaining divisions (K'e and Ying). It is evident that the Foh-Kien is an elevated and learned school, and the Kwang-Si an inferior and popular school; there must be therefore in some sort two Feng-Shui. This is hinted at in Mr. Eitel's treatise, but is not made sufficiently plain.

The heavens and the earth, the latter being only a reflection of the former, the five planets, and the five, or in the earliest systems, the six elements, the twelve signs of the Zodiac; the twenty-eight lunar constellations, the Great Bear and the imperfectly defined constellation called the Bushel, are the principal objects whose isolated or combined influence acts on human destinies. To these must be added the influence of the dead upon the living, and the ties which unite one generation to another. This is what is contained in the section named Li. What follows belongs to the section Su. To define general ideas, the Chinese have invented diagrams to represent certain fundamental notions, such as the male and female principles; they first formed four, then eight, and then by combinations, sixty-four diagrams, each having its special name and qualities. Moreover, as they held the number of the planets to be five, and that of the terrestrial elements six, they agreed that celestial arithmetic was based on the decimal system, and terrestrial arithmetic on the duodecimal, the uneven numbers being always connected with the female principle, the even numbers with the male. The multiplication of the elements of the two systems by one another gave sixty cyclical characters, which multiplied by six, give the 360 degrees of the Ecliptic. A compass containing eighteen concentric circles which correspond with the different elements of the system, and are themselves divided into various sections, is used by the adepts of Feng-Shui. It is by taking account of the data furnished by the use of this instrument that they solve the problems put to them. This compass is the weapon of the Chinese geomancer, provided he belongs to the school of Foh-Kien.

The sections K'e and Ying do not possess the same learned apparatus. The world, according to the Chinese, is animated by a vital breath; there is in nature, as it were, a great movement of inspiration and expiration. Mr. Eitel at first thought that he could see in this theory a vague consciousness of the existence of magnetism; but he finally decided to the contrary, and rightly so. We may indeed see in it the notion roughly sketched in of the circulation of our atmosphere. The theory of the direction of the wind is connected with that of the direction of the waters, and as both depend on the configuration of the earth's surface (Ying), it is on this latter part that the practical application of the system rests. The theory of K'e and Ying is, as we have said, the principal subject studied by the school of Kwang-Si, and this is, to all appearance, the true Feng-Shui. The very name of Feng-Shui, which means wind-water, seems to be derived from it, and the native explanation of the word, given by Mr. Eitel (page 3), is too subtle and too Chinese to be true.

Mr. Eitel closes his work with a sketch of the history and literature of Feng-Shui. According to him, if the origin of this "science" dates from the origin of Chinese society, the definite form which it has since received is comparatively modern. It was only after the time of Confucius that it was constituted, without opposition from, and almost with the tacit consent of his followers. The first exponent of Feng-Shui, the Tsch-king (canon of the dwellings), appeared under the dynasty of Han. The Tsang-Shoo (book of interment), published under the Tsin (A.D. 265-419), dates from a period when Feng-Shui assumed an expanded form. The dynasty of Tang (A.D. 618-905) gave a new impulse to the system, which enriched itself with new notions, and to illustrate these several works were composed. Finally, under the dynasty of Sung (A.D. 960-1126), the various theories which had been held from the very earliest times were collected and put in order, and the system was completed.

Mr. Eitel finds in Feng-Shui traces of nearly all the religious and philosophical schools of China. Monotheism, which, as Mr. Eitel believes (and in this he does not stand alone), primitively existed in China, is no longer recognisable, but the influence of Tanism, of Buddhism, and of the modern Choo-he, may be easily perceived. These points, as well as several others insisted upon by the author, require a more complete demonstration, such as could only find place in a more extensive work. Mr. Eitel's pamphlet is a simple sketch; but it is complete in itself, and furnishes the ground-plan of a vast and important work on one of the most curious portions of Chinese literature and civilisation.

LEON FEER.

NOTES AND NEWS.

On the Formation of Glycogen in the Liver.—B. Luchsinger, in a paper contained in the 6th part of *Pflügers Archiv*, 1873, states, as the result of his observations on the effects of feeding animals on different diets, that glycerine increases the proportion of glycogen contained in the liver, not, however, because it easily undergoes combustion, and thus spares glycogen, but because, escaping (*entrinnend*) oxidation, it reaches an organ in which its conversion into sugar is rendered possible. He believes, therefore, that glycogen originates from glycerine as well as from the carbo-hydrates.

Anatomy of the Nervous System.—Axel Key and Retzius, in a recent number of Max Schultze's *Archiv* (1873, b. ix. p. 308), give the result of their enquiries into the anatomy of the nervous system. Their account of the subarachnoid trabeculae is important in relation to recent views upon the structure of connective tissue and tendon. They find these trabeculae are composed of fine fibrils, and are always, whether coarse or fine, completely invested by a delicate sheath, which is in more or less close contact with them. The sheath is homogeneous except for the presence of a few nuclei, and they regard it as being composed of endothelial cells, the contour markings of which can be brought beautifully into view by staining with nitrate of silver. On treatment with acetic acid, the sheaths break up, roll back, and form the so-called elastic or spiral fibres. They describe the pia mater as consisting of two layers, of which the internal is uniform in most mammals, whilst the external varies greatly in thickness. The external is composed of fibrillar connective tissue, and with it the *lig. denticulatum* is connected. The internal layer is itself compound, consisting

of a layer of circularly arranged connective tissue fibres, covered on both sides by an endothelium with firm elastic fibres. The inner surface of the dura mater is invested by an extremely thin membrane, which is formed of two layers corresponding to the two internal laminae of the pia mater. In their researches on the peripheric nervous system, Key and Retzius find that the nerve fasciculi which compose any large trunk, as the sciatic, are each surrounded by a more or less broad ring, formed by a perineurium, from the inner side of which are given off connective tissue fibres which penetrate the nerve, and are called endoneurium, whilst from the outer surface other fibres pass off between adjoining fasciculi, and are called epineurium. Injections seem to split the perineurium into two delicate membranes, which are prolongations of those of the arachnoid.

Formation of Pepsin.—Ebstein and Grützner, in an article contributed to *Pflügers Archiv* (1873, viii. p. 122), state that their investigations have led them to the conclusion that pepsin exists in the chief cells ("Heidenhain's Hauptzellen") of the fundus of the pyloric glands, not in the pure state, but in combination with albumen. It can be extracted in this form and combination by water, in which it is soluble, but then possesses no digestive activity. But when the compound is broken up, the pepsin, freed from the albumen, exerts its ordinary action. In the fundus ventriculi, the mucous membrane of the gland-cells is covered, in addition to the Hauptzellen, by investing cells (Beleg-zellen), the contents of which, when discharged, act, like common salt or hydrochloric acid, in decomposing the combination between pepsin and albumen. In fact, they believe the investing cells contain chlorides, which exert the influence in question.

Influence of Morphia on Nutrition.—An important paper appears in the last part of the *Wiener Sitzungsberichte*, by Kratschmer (Band lvi. Heft iii. iv. and v.), on the Influence of Morphia, and of Carbonate and Sulphate of Soda on the Formation of Sugar and the Excretion of Urea in Diabetes. The most interesting point to the general reader is the conclusion at which he has arrived, from his very careful and prolonged series of observations, that we possess in morphia a means that not only very materially reduces the excretion of sugar by the urine in this disease, but materially diminishes the metamorphosis of tissue in the body generally. In a broad point of view, therefore, morphia resembles alcohol and tobacco in this respect, and would form a valuable means of making up for an imperfect supply of food.

Digestion of Albuminous Compounds.—During the last few years it has come to be very generally held by physiologists, that one of the principal functions, if not the principal, of the stomach is to reduce albuminous compounds to the condition of peptone, that is to say, to change a colloid and undialysable substance to a crystalloid and dialysable substance. M. Leven, in a paper read, on Feb. 21, before the Society of Biology, in Paris, combats this view, and has been led from an extensive series of researches to agree with MM. Claude Bernard and Blondlot, who believe that the essential function of the stomach is the mechanical one of diminishing the bulk of the alimentary mass, and reducing it to a uniform consistence. M. Leven's experiments were made on eggs, meat, and milk. He first introduced into the stomach of a dog 88 grammes of hard-boiled eggs. An hour afterwards the white was intact, but the yolk had disappeared. The gastric secretion had in some way liquefied the fatty matter of the yolk, reducing it to a finely granular condition, and the granules were found distributed over the small intestine. The white of egg when hard boiled was not reduced to a finely granular condition until the lapse of three hours, when 31 grammes were found to have thus disappeared. Fluid white of egg was much more rapidly dis-

posed of, 50 grammes disappearing in the course of an hour. Milk passes very rapidly into the small intestine, so that 100 grammes of milk leave little but an inconsiderable quantity of coagulated casein. Meat, according to M. Leven, is only partially, if at all, digested in the stomach; if a ligature be passed round the pylorus after 35 grammes of meat have been introduced into the stomach, there still remain, after the lapse of twenty-four hours, from 25 to 30 grammes of meat broken up into fibrils, which preserve their transverse situation, and very little peptone is present.

Function of the Semicircular Canals of the Ear. Professor E. Cyon communicates to *Pflügers Archiv* (Band viii., Hefte vi. and vii.) the results of experiments he has undertaken to determine the function of the semicircular canals. He finds that in the first place it is absolutely necessary for the preservation of its equipoise that the animal should possess an accurate knowledge of the position of the head. 2. The semicircular canals, by means of a series of unconscious perceptions, supply or furnish the animal with the knowledge of the position of its head in space—each canal having relation to one dimension. 3. The disturbances in the muscular movements which occur after section of the semicircular canals are of three kinds: (a) Disturbances of equilibrium consequent upon the direct injury; (b) Compulsory movements consequent upon excitations arising from abnormal auditory sensations; and, finally, Consecutive phenomena consequent upon inflammation of the cerebellum. These occur a few days after the section.

THE fifth number of the *Journal d'Agriculture Pratique* for the current year contains an interesting article by Colonel Pearson on the Forests of Central India. Formerly the ownership of all the soil was vested in the Government. The inhabitants had no right of property in the forests, although they were allowed to drive in their cattle at certain periods of the year, and also to collect wood. A tax was payable by the commune or individual proprietor in return. These privileges had, however, assumed the character of rights, and stood in the way of any effective measures for forest conservation. The Government therefore assigned to the various proprietors under the new settlement a proportionate share of forest in extinction of the former rights, and so obtained complete control over the remainder.

The two most important timber trees are teak and saul (*Shorea robusta*). The former mainly occupies the western and the latter the eastern forests. The saul grows more actively than the teak, and where they come in contact appears to be displacing it. Teak is an extremely valuable wood, but it is difficult to manage. It gives very little shade, yet it is necessary to have sufficient to protect the young seedlings which are to renew the forest when the parent trees are cut down. Bamboo is very suitable for the purpose, but its culture presents enormous difficulties. Other plants would grow so rapidly as to overpower the seedlings they were intended to protect. The management of saul forests is also not unattended with difficulties. The trunk yields a resin called dammar, and the branches, in common with those of some other trees, produce under the attacks of a *Coccus* the substance known as stick-lac. It is necessary to restrain the collection of these products in the reserved forests. Then the seeds lose their germinating capacity after twenty-four to forty-eight hours. They cannot therefore be sent from one place to another, and it is necessary to trust to spontaneous sowing for the renewal of the saul forests.

THE great Geological Survey of the Austrian Empire has been completed, and we now have in twelve folio plates the results of this important undertaking. The whole is divided into 102 sections, arranged in reference to definite geognostic formations, and distinguished by various shades of colour. The survey and the elaboration

of its results have been under the direction of Herr Franz Ritter von Hauer, who has been ably seconded by the very efficient staff of the Imperial School of Mines at Vienna, and by their joint labours they have succeeded in giving to the world a work which will rank as one of the most important contributions to the science of European topography, and cannot fail to earn the grateful appreciation of all geologists. The maps of Bohemia, Dalmatia, and the Alpine districts were published some years ago; and by the publication of those sections of the work which include the Carpathian mountain system, the entire series is now completed.

The scientific investigation of the important region of the Carpathian mountain system is not only calculated to exert a powerful influence on the material prosperity of the Austrian Empire generally, but will probably also have a marked special bearing on the ethnological character and future social condition of the inhabitants. The Carpathian range, which is intersected at three distinct points by the Danube, forms a widely opening arc around the fruitful basins of Hungary and Transylvania, and may be regarded, both geognostically and geographically, as a continuation of the Alps. Hitherto the nations occupying the area enclosed by this mountain rampart have lived an isolated existence, content with the scanty resources at their command, and indifferent to the world beyond their Alpine barriers; and as an inevitable result of these conditions, they have remained stationary, while the nations around have advanced. The newly-completed survey of this region, by revealing its true resources and teaching Austria where to seek with a good chance of success for its metallic treasures—which undoubtedly include zinc, lead, copper, cobalt, nickel, antimony, mercury, gold and silver, some iron, and probably potash and soda—has already, we may safely assume, put in the thin end of the wedge which will open the way to the advance of civilisation and progress.

AN interesting paper on the "Reindeer of Thaugen" was read, by M. Bertrand, on the 16th instant, before the Académie des Inscriptions. At the beginning of the present year some school-children from Thaugen, in the canton of Schaffhausen, when out on a botanical excursion, discovered a bone-cave, full of bones and flint implements, a great quantity of which they sent to Dr. Keller and Herr Heim, at Zürich. On examination, these savans discovered numerous bones, bearing drawings executed with a sharp flint; among these was the subject of M. Bertrand's paper, the picture of a reindeer browsing, remarkable for precision of drawing and delicacy of execution. M. Bertrand believes these remains to be upwards of 4,000 years old; and suggests that the contribution of the Troglydite populations of Gaul to European civilisation may have been the arts of design.

THE *Times* quotes from the *Brisbane Courier* of December 30, 1873, the following official telegram from Mr. Walter Hill, the Government botanist, dated from Cardwell on the 27th, and received by the Queensland Secretary for Lands:—

"Since November 20, we have examined the banks of the Mulgrave, Russell, Mossman, Daintree, and Hull rivers, and have been more or less successful in finding suitable land for sugar and other tropical and semi-tropical productions. The ascent of the summit of Bellenden Kerr was successfully made by Johnstone, Hill, and eight troopers. At 2,500 feet in height we observed an undescribed tree with crimson flowers, which excels the *Poinciana regia*, *Colvillea racemosa*, *Lagerstroemia regia*, and the *Jacaranda mimosifolia*. At 4,400 feet a tree-fern, which will excel in grandeur all others of the arboreous class. A palm tree at the same height, which will rival any of the British-India species in gracefulness. On the banks of the Daintree we saw a palm-tree cocoa, which far exceeds the unique specimens in the garden of the same genera from Brazil in grandeur and gracefulness. While cutting a given line on the banks of the River John-

stone for the purpose of examining the land, an enormous fig tree stood in the way, far exceeding in stoutness and grandeur the renowned forest giants of California and Victoria. Three feet from the ground it measured 150 ft. in circumference; at 55 ft., where it sent forth giant branches, the stem was nearly 80 ft. in circumference. The River Johnstone, within a limited distance of the coast, offers the first and best inducements to sugar cultivation."

THE annual meeting of the Woolhope Field Naturalists' Club was held at Hereford on the 2nd instant. The Rev. James Davies, M.A., of Moorcourt, President for 1873, delivered his retiring address, in which he reviewed the operations of the club during the previous twelve months. The weather had been unfavourable at nearly every field meeting, and had interfered with the due execution of the club programme; but, in spite of all drawbacks, the work accomplished had been satisfactory, and, in particular, the great gathering of mycologists in October had been signally successful. A detailed account of this so-called "Fungus Foray" will be given in the forthcoming volume of the *Transactions* of the club, in which also will be included some valuable contributions made by various members to the natural history and archaeology of the district. A passage in Mr. Davies' address, on the scene of the last struggle of Caractacus, called forth considerable discussion, but it was at length agreed that Breidden Hill, near Welshpool, seemed to satisfy the requirements of the historian better than either Coxwall Knoll or Caer-Cardoc. Camden, indeed, argues strongly in favour of the last-named place, and it must be admitted that there is much probability that the British chieftain's name would be associated with the site of his final battle with the Roman general. But, on the other hand, we can find nowhere else than at Breidden the "annis vado incerto," which Tacitus (*Ann. lib. xii. cap. 31, et seq.*) describes as flowing in front of the British position. And although it is somewhat strange that the historian should not have called the river by its proper appellation, it is quite possible that in early times its lower section only was known as the Severn or Sabrina, or that the notions of Tacitus as to the course of the stream were not less inaccurate than those which he held with regard to the Thames.

The field meetings of the Woolhope Club during the current year will be as follows:—May 15, Church Stretton, Shropshire; June 19, Bulth, on the Upper Wye (a district of rare interest to the botanist and geologist); July 17, the Downard Caves (which recent researches have shown to be rich in palaeontological remains); August 18, Lydney and the Forest of Dean.

MR. EDWARD ATKINSON, an American writer on *Cotton Culture in the South*, once predicted that cotton would be sown in hot-beds and planted out. A recent official report from Georgia tells us that an experiment of this kind has been tried by a planter there with perfect success. He dug long pits about three or four feet deep, and had a number of boxes made with shavings, larger at the top than at the bottom, placed them on planks at the bottom of this pit, filled them with manure and soft earth, and planted his seed in January. He covered the pits with canvas at night and in very cold weather; and in April, when people were preparing to plant, he had stalks a foot high. He then carried them out on their planks to the field, dug his holes, slipped his plant down, and raised his box out, and thus the plant never felt the change. He made nearly two bales to the acre, and contends that it was easier to do this than haul out his stable manure. "He is a very practical man," adds the chronicler of this apparently well-authenticated piece of intelligence, "and has made a fortune, which is pretty good evidence of his good sense." The same report states that it is likely that cotton will be grown in California to a certain extent. Some experiments in 1871 were so favourable, that in 1872 a crop of 1,500 bales was expected, which would be

a crop of about one bale per acre. Last year, it was thought, the average would be more than doubled. The Californian cotton had a ready home market, being found to possess a remarkable fitness "for combination with wool in various fabrics."

In a lecture on *Vestiges of Antiquity*, delivered before the New York Geographical Society, in January, 1873, by Dr. A. Le Plongeon, resemblances are pointed out between the architectural ruins of South America and those of Assyria and Egypt. Coincidences, also, in the religious symbols, rites, and beliefs of the inhabitants of the Old and the New World are brought together in great abundance. Such coincidences have been dwelt on so often by travellers and historians that we should not have called attention to Dr. Le Plongeon's lecture for their sake alone. They are curious, and nothing more. They are generally exaggerated, or, at all events, placed in a false light by being taken out of a mass of evidence which ought to be considered as a whole. Nothing has done more mischief in Comparative Archaeology than these vague comparisons. To call all upright stones with a slab on the top a *Cromlech*, every stone chamber a *Kist-van*, and every stone with a hole a *dolmen*, is not much better than if we were to call every blue flower a blue-bell, or go into raptures because some flowers have red blossoms not only in Cornwall but in Hawaii. There are stone chambers in Hawaii, very like the Cornish *Kist-vans*, but so far from this being startling, it would be much more startling if it were otherwise. The same applies to many of the archaeological coincidences pointed out by Dr. Le Plongeon. Comparative researches must be preceded by discriminating study. Nothing that can be explained rationally in the Old or in the New World can be used as evidence for a prehistoric intercourse between the different races of mankind. Only what is irrational, accidental, or individual, if it occurs in exactly the same form among widely distant nations, can be admitted as *prima facie* evidence for a real historical contact. Hence the great value of words and grammatical forms in settling the historic and pre-historic relationship of nations; though here, too, a discriminating study of each language must needs precede a comparative study of many, as the only security against our being surprised, for instance, at such coincidences as Etruscan *Klan*, Turkoman *oglan*, son, and Gaelic *clann*, children, which is the Welsh *plant*. Long lists of similar coincidences have been collected with the sole object of their serving as a warning against too hastily admitting a relationship between languages that may have a few words in common. There is, however, one piece of linguistic evidence brought forward by Dr. Le Plongeon in support of the often asserted communication between China and America, which deserves attention. He writes:—

"That some of the inhabitants of these countries (China and Japan) landed in South America is certain; but it is certain, also, that they did not influence the civilisation or religion of the population among which they commingled; nay more, they even retained their own habits and language. To-day, on the northern coast of Peru, exists a small village called Eten, the dwellers of which speak a language that their neighbours are unable to understand, but they find no difficulty in holding communion with the Chinese coolies, who of late years have been imported thither. Besides, in searching among the ruins in the Grand Chimú's City, situated between Trajillo and the pool of Huanchaco, some silver idols have been found, inscribed with very ancient Chinese characters. Some have likewise been dug up from the mounds in the Valley of Chincha Alta, 400 miles to the southward. I have examined these idols carefully. They bore marks of being very ancient. Two that were in my possession represented a man sitting cross-legged on the back of a tortoise. The head was shaved except the top, from which depended, hanging on the back, a lock of long hair braided Chinese fashion. In one of them the heads were wanting. This was placed between two pillars, surmounted by a perfect arch. The

characters, sculptured in *alto relievo* on the pillars, were so time-worn and defaced as to be illegible. Not so with the other. The arms of the figure were extended; the hands rested on short pillars. There was no arch. And notwithstanding this relic was very much eaten by the rust and the salts contained in the earth, where for centuries it had lain undisturbed, some signs were plainly visible on the pillars. They somewhat resembled the Chinese writing, but seemed somewhat different from those in use to-day.

"The finding of these relics was quite important in my estimation. I set forth in search of a person who could interpret them for me and dispel my doubts. I knew a very intelligent Chinaman, acknowledged to be by his countrymen a gentleman of great literary attainments. He examined the queer object for a long time; looked at it on every side; then, without speaking a word, looked at me—looked at my relic again, his features betraying astonishment, nay, veneration, not altogether free from awe. He was evidently overcome by a strange feeling. 'Very old,' said he at last. 'These are very ancient characters, used in China thousands of years ago, before the invention of those now employed. They mean Fo-Hi.' This was sufficient. In remote times the Chinese had visited this country, and no doubt the present dwellers of Eten are some of their descendants."

What the intelligent Chinaman intended was, probably, not that these characters meant Fo-Hi, but that they were the characters invented by Fo-Hi, Fo-Hi being a mythical person who is believed to have invented not only the Chinese letters, but Chinese music, law, marriage, and several other things. But however that may be, the two statements that idols made of silver found in South America contain ancient Chinese letters, and that the inhabitants of Eten speak a dialect intelligible to Chinese coolies, deserve attention and—verification.

A PORTION of the first part (A. to E.) of the *Lancashire Glossary* is completed, and will be sent to press immediately. It is believed that the whole of this first part will be ready for publication by the end of the year. The question of the method of marking the pronunciation has at length been settled, Mr. Thomas Hallam, who prepared the Derbyshire varieties for Mr. A. J. Ellis's collection, having prepared a Glossic table on Melville Bell's system, which, it is thought, will be at once scientific and sufficiently understandable by ordinary readers. Mr. Hallam has kindly undertaken to mark the pronunciation and superintend this portion of the work. Two considerable manuscript collections of words have been placed at the service of the editors—one by the Rev. John Davies, author of *The Races of Lancashire* (Philological Society's *Transactions*), which comprises his own lists and those of two friends living at Warrington in the extreme south, and Oartmel, in the northern or Furness district of the county; and the other by the Rev. Addison Crofton, sometime of Walmersley, near Bury, and now of Levenshulme. The Earl of Derby, Mr. Francis Espinasse, and Mr. John R. Wise have added their names as subscribers to the guarantee fund.

A PHOENICIAN inscription of unusual interest has been recently procured by M. de Sainte-Marie, the French Consul at Tunis, and will be published, together with a careful commentary on it, by M. Derenbourg, in the next number of the *Journal Asiatique*. It has been, unfortunately, broken off on all its four sides, the portion remaining (viz., parts of six lines of the column to the right, and of ten of that to the left) having originally formed nearly its centre. No single line is complete except the first and the seventh of the left-hand column, which contain the words "Fourth day" and "Fifth day" respectively, and these only.

The left-hand column appears to be part of a daily ritual for the offering of first-fruits at some autumnal festival; and, as the offerings of the Fourth day (consecrated bread, figs, and incense) occupy all that is preserved of six lines, it is probable that the whole number of lines on the stone,

when entire, was forty-two. The column on the right hand may have contained a hymn or a prayer which was chanted at the time the offerings were made. There is reason also to suppose that the individual lines were shorter than those in the other column, and they had a rhyming termination.

It will at once be seen that this inscription is one of great importance as well as curiosity; it is, indeed, unique both in subject and style. We have no other instance in Phœnician of a ritual for the offering of first-fruits, and the language employed is graver and more ornate than is usual. One or two words, new in Phœnician, have been detected in it, but no proper names.

DR. TISCHENDORF has recently brought out, in conjunction with Baer, the eminent Masoretic scholar, and Delitzsch, the Biblical commentator, a convenient edition of Jerome's own version of the Psalter, with the Hebrew text opposite (Leipzig: Brockhaus). Both the Latin and the Hebrew are revised in accordance with the best MSS. As is well known, the new version was not admitted into the Vulgate, the elder one (corrected by Jerome) having been already set to the Church music.

THE *Nation* states that Professor Whitney's *Language and the Study of Language* is to be published, in German, at Munich, Dr. Jolly, of the University of Würzburg, being the translator.

A SOCIETY for the Encouragement of Oriental Studies has recently been formed at Lisbon, under the presidency of the Duke of Coimbra, brother of the King.

THE *Corpus Inscriptionum Semiticarum*, the publication of which was voted by the Académie des Inscriptions in 1867, will appear shortly.

PROFESSOR A. B. DAVIDSON, of Edinburgh, author of perhaps the most scholarly work of Old Testament exegesis which has appeared of late years on this side the water (*Commentary on the Book of Job*, vol. i., Williams & Norgate), has just published *An Introductory Hebrew Grammar* (Edinburgh: T. & T. Clark). Its design is twofold—"first, to present in short compass the main principles of Hebrew grammar; and, secondly, to accompany the principles with progressive exercises for the practice of the learner." It is decidedly more successful than any of the shorter grammars, in combining theoretic accuracy with a regard for the practical requirements of beginners.

MEETINGS OF THE WEEK.

ENTOMOLOGICAL SOCIETY (March 16).

SIR SIDNEY SMITH SAUNDERS, C.M.G., President, in the chair.—Mr. Champion exhibited specimens of *Euryporus picipes*, taken near Chatham. Mr. Edward Saunders exhibited a box of *Buprestidae*, collected by Professor Semper in the Philippine Islands; and read notes and descriptions of the new species. A paper was communicated by Professor Westwood on several additional species of *Lucanidae* in the collection of Major F. J. Sidney Parry.

ROYAL ASIATIC SOCIETY (March 16).

MR. T. W. RHYS DAVIDS exhibited a collection of coins made by him during his residence in Ceylon, consisting of ancient Singhalese, as well as of Dutch and English gold, silver, and copper pieces struck in the island. Several of these were found to be of extreme interest, especially a lion coin of Parākrama the Great (A.D. 1153-1188), and a gold coin bearing the name of Lakshmi, of probably about the same age, the only specimens known to exist in Europe; besides two gold coins of Parākrama bearing the legend *Lankesvara*. This is presumably the most complete collection of its kind. It also includes a number of more modern coins of various other Eastern nations. At the same meeting, Dr. Leitner, of

Lahore, gave an account of his philological materials on the dialects of the Dard tribes, consisting of comparative vocabularies, legends, manuscripts, and inscriptions.

SOCIETY OF ARTS (Tuesday, March 17).

VICE-ADMIRAL ERASMUS OMMANNEY, in the chair.—Two interesting papers on the Geographical and Physical Character of the Diamond Fields of South Africa were read. The first, by the Hon. Theophilus Shepstone, the Secretary for Native Affairs in Natal, described the conditions under which the diamond is found on the Vaal River. He pointed out that Africa south of the equator consists of a great central irregularly shaped basin, the outer edges of which varied in height from 4,000 to 10,000 feet above the level of the sea, and that through this river the Orange River to the south-west and the Limpopo river to the north-east cut their way. It is near the exit of the former from the enormous basin that the Diamond Fields lie, while gold in large quantities is being obtained from the north-eastern district. The author of this paper conjectures that this basin is the dry bed of an enormous inland sea, and that the diamonds which are found in it were formed by carbonic acid gas ejected by the action of subterranean heat through fissures in the earth's surface into the bed of the dried-up sea, the water of which was sufficiently deep to imprison and liquefy the gas after its evolution. The discovery of the process by which this liquid gas became crystallised, whether by electric or magnetic current, or by the potent influence of iron in some of its numerous forms, must be left for future scientific investigation. The second paper, by Dr. Robert Mann, late Superintendent of Education in the colony of Natal, dealt principally with the commercial aspects and influences of the South African diamond and gold fields. Since the first serious working of the Diamond Fields in 1871 large numbers of diamonds had been obtained, and it was estimated that in 1872 there were no fewer than 20,000 miners engaged in searching for them. So large has been the yield that a very material diminution has been brought about in the value of the larger gems in the home market, and the diggers are now leaving the Diamond Fields for the more profitable north-eastern gold-fields. The result of the discovery of these fields has been to develop South African commercial enterprise, and to civilise the wild tribes in that part of the continent. In the course of the discussion which followed the reading of the papers, Mr. Reightheil expressed his deep regret that the diggers at the diamond and gold fields of South Africa were in the habit of selling guns and ammunition to the natives who worked for them. Mr. Cooper, who had been a digger for three years, thought that the blame attached rather to the British Government, who permitted the arms to be sold, than to the diggers, who merely paid the natives for their services. Mr. Sopen, a diamond merchant, stated that the number of diamonds of the purest water received from the Cape was very small, not amounting on the whole to more than 2 or 3 per cent., while of ten-carat stones not one in 10,000 was perfect. In consequence of the large quantity of second-class stones received from the Cape, such gems were now 60 or 70 per cent. cheaper than they were three years ago. Stones which some time since would have realised 1,500*l.* would now only fetch 200*l.* The first class diamonds, however, were rather dearer than formerly. Professor Tennant, in reply to a question, said that there was no truth in the report that Cape diamonds gradually lost their brilliancy after being cut and polished.

LONDON ANTHROPOLOGICAL SOCIETY (Tuesday, March 17).

DR. CHARNOCK, F.S.A., President, in the chair. The papers were:—1. "Spiritism among Uncultured Peoples compared with Modern Spiritualism," by

O. Staniland Wake, V.P.L.A.S. After referring to the influence which spirit belief has always exercised over the uncultured mind, and giving particulars of various phenomena occurring among savages, which resemble those of modern spiritualism, the author considered some of the phenomena of the latter, which were, he thought, capable of a natural interpretation, even according to the spiritualists themselves; 2. "Opinions of the Brahmins as to Spiritualism and Supernatural Phenomena," by G. Mohun Tagore. The idea of good spirits being possessed is peculiar to the Hindus, and is not traceable to either Christians or Jews. The doctrine that an essential body survives the destruction of the present body throws considerable light on Corinthians, chap. xv., and may be a prelude to acceptance of Christianity by the Hindu race; 3. "Interpretation of Mythology," by Dr. Kaines. The author believes the physical theory to be the only true interpretation of mythology, inasmuch as it shows that it consists mainly, if not entirely, of the later personifications of Fetichism transformed.

SOCIETY OF ANTIQUARIES (March 19).

A. W. FRANKS, Esq., Vice-president, in the chair. A paper was read by Major Heales, on "Sepulchral Brasses at Paderborn and Seville," rubbings of which were exhibited. Of these, one represented an archbishop of Paderborn, who died in 1340. The brass is cut out in the shape of the figure as is common in English brasses, while the continental brasses are more usually engraved on a rectangular plate. The attitude is uncommon, for, instead of the usual position of repose, the bishop holds his pastoral staff in the left hand, while the right hand is uplifted in the act of benediction. Portions of another brass were exhibited which covered the tomb of Archbishop Rupert, who died in 1394. The head of the figure is supported by angels, and surmounted by a canopy of great beauty. The brass over the tomb of Rivera, Viceroy of Naples, who died in 1571, which is now at Seville, is the only one known to exist in Spain. The figure stands in an easy attitude, with the left hand resting on his sword. Although the execution is fine, the attitude is singularly inappropriate for a sepulchral monument in a horizontal position. In the course of the discussion which followed, it was stated by Mr. Franks that brasses were largely imported from Flanders into England, already fixed in their stone beds, which has been proved by a geological examination of the stones in several churches in England. Another paper was read by Mr. Price concerning some pottery found in a Roman cemetery, which has been discovered during the excavations for the railway in Liverpool Street. Among other articles exhibited, were some early charters—one of Archbishop Dunstan—which were sent by the Rev. Canon Robertson from Canterbury Cathedral; and some specimens of Roman pottery found near Derby.

NUMISMATIC SOCIETY (Thursday, March 19).

A PAPER by Mr. F. Conder was read on the Jewish Coinage, in which the writer overturned, or conceived himself to have overturned, a large proportion of the received opinions on the different questions involved. For example, the word *she'mon*, hitherto supposed to represent the proper name Simon, is, according to Mr. Conder, to be understood as meaning "legal," "authorised," as compared with unauthorised issues. In a similar manner Mr. Conder dealt with other words occurring on the coins, such as *lucheroth*, *ligullath*, in every case demonstrating to his own satisfaction that the explanations accepted by such scholars as De Saulcy and Levy are erroneous. Mr. Conder also set forth a new theory of the sequence of the types, which, however (as Mr. Evans afterwards remarked), is effectually upset by a *surfrappé* coin in the British Museum. Most of Mr. Conder's

hypotheses were supported by a vague reference to the Talmud, the authority of which in numismatic matters is, to say the least, questionable, notwithstanding its learned disquisition on the coin of Abraham.

PHILOLOGICAL SOCIETY (Friday, March 20).

MR. HENRY SWEET read the first of his three papers on "The History of English Sounds," of which the following is a brief summary:—

Two methods of studying the phonetic history of a language are open to us: (1) the comparison of older forms preserved in living languages belonging to the same family; and (2) we may trace the various sounds through the successive stages of one and the same language. But this last method, being based chiefly on the study of dead languages, postulates a preliminary investigation of the signification of the written symbols in which these dead languages are alone preserved for us. It is evident that the value of these symbols as representing the actual sounds may vary indefinitely, from the comparative perfection of Hungarian and Finnish to the utter barbarism of the present English orthography, whose value as phonetic evidence is simply *nil*. The investigator of the changes in English sounds during the last few centuries must, therefore, fall back on the external evidence afforded by contemporary phonetic treatises and comparisons with foreign languages. Of this method the well-known work of Mr. Ellis is an illustrious example.

Unfortunately this external evidence is always of an extremely defective and inaccurate character, owing to want of proper phonetic knowledge among those who wrote on pronunciation. Much more accurate results may be obtained by combining a comparison of the often very archaic sounds preserved in the living Teutonic languages with a study of the written forms of the oldest English and its contemporaries, for the want of external evidence in these early periods is fully compensated by the accuracy and delicacy with which the various sounds were written down.

The great difficulty that confronts us in comparing the sounds of the modern languages is that of determining which of the various sounds is the oldest, and how the others arose from it, also what intermediate stages there were. This necessitates a preliminary study of the general laws of sound-change. They are of three kinds: (1) organic, (2) imitative, (3) inorganic. Organic changes are those which are the direct result of certain tendencies of the organs of speech: all the changes commonly regarded as *weakenings* fall under this head. Imitative changes are the result of an unsuccessful attempt at imitation: their results are often directly opposed to those of organic change. Inorganic changes, lastly, are caused by purely external causes, and have nothing to do with weakening or imitation. It would, for instance, be entirely misleading to explain the change of the Old English *bær* (preterite of *beran*) into the modern English *bore* as an organic phenomenon, for the preterite *bore* is simply the result of confusion with the participle *borne*.

But the investigation of these changes leads us to wider generalisations of the highest importance. Language agrees with the other manifestations of organic life, not only in its unceasing alternations of decay and regeneration, but also in its progressive complexity, shown in the large number of vague vowel-sounds in English as compared with the clear simplicity of the Gothic and Sanskrit triad *a, i, u*. Hence follows another law, namely, that the changes in early languages are not gradual, but *per saltum*.

After determining approximately the values of the Roman alphabet, Mr. Sweet discussed the Old English sounds in detail, giving a summary of the evidence afforded both by the graphic forms of the MSS., and by the sounds still preserved in the living language.

FINE ART.

Catalogue of Prints and Drawings in the British Museum. Division I. Political and Personal Satires. Vol. II. Printed by order of the Trustees.

IN reviewing the first volume of this valuable work (ACADEMY for March 1, 1871), we called attention to its leading features, which may be thus summarised: the ability and industry shown by its compiler, Mr. Frederic G. Stephens; the great quantity of curious and interesting matter which it embodies, in the way of historical, social, and general elucidation of the periods covered by its contents; the arrangement of the items according to historical rather than artistic convenience, *i.e.*, in the order of date pertinent to their principal or earliest subject-matter; and the careful but sometimes needlessly tautologous system of its cross-references. The present volume is on the same plan, and has a like worth of substance and of execution. It is considerably the larger of the two. Vol. i. contained 1,235 entries in 752 pages; vol. ii. presents only 780 entries (going up to No. 2,015), but these occupy 868 pages. The former volume, beginning at the earliest date, went on to April, 1689; the latter only continues as far as 1733: so vastly does the ratio of satirical prints and drawings per year increase as we advance in date. The collapse of Walpole's Excise scheme, in April, 1733, may be regarded as the latest distinct limit of date in vol. ii. Vol. iii. is to begin with 1734, and with the *Harlot's Progress* by Hogarth; truly an "epoch-making" work, as the Germans would say, and as Mr. Reid, the Keeper of the Prints, points out in his Introduction.

The question which of the two volumes is the more interesting for readers must be settled according to individual predilections. Some people will prefer the era of the Gunpowder Plot, or the Parliamentary struggle and the Commonwealth; others, that of Louis XIV., the South Sea Bubble, the Walpole ministry, and the beginnings of Hogarth's art. It may truly be said that one can hardly open a page in either section of the work without finding some detail worthy of catching and fixing the attention. As Mr. Reid observes, the art-satires produced in England were mostly of a very simple kind until past the middle of the seventeenth century; they then began to progress in elaboration of matter, and sometimes in keenness of point. In the present volume there are several citations of sharp things cleverly said, as well as descriptions of effective hits by the designer. Yet, taking them generally, we cannot say that the tone of the satires is much more refined or subtle than in the previous volume. Bluntness, doggedness, and spite, are the rule; light but cutting *persiflage*, the elegant handling of a deadly weapon, is the exception.

Mr. Stephens has certainly taken a great amount of pains with his task, which, if attractive and diverting in some respects, must none the less have been highly laborious in others. He explains all sorts of subjects definitely and succinctly, and in numerous instances makes plain to the reader

what must have been very obscure to himself until careful and independent research enabled him to thread the mazes of the old caricaturist's intention. The business of the critic, however, is not so much to follow Mr. Stephens in the hundreds of cases where there is nothing to express save thanks for his pains, and acquiescence in his conclusions, as to indicate some few points here and there where demur may be apposite, or rectification practicable.

In the first place, then, we must repeat, as in reference to vol. i., that several of the designs here registered are not satirical at all; and, where the multiplicity of truly satirical subjects is so enormous—almost too great for the biggest catalogue or the most strenuous compiler to overtake—it seems a pity to weight the work still further with extraneous matter. The *Medal on the War in Ireland*, 1690 (No. 1,252), is in no way a "political or personal satire;" on the contrary, it is in the nature of an encomium or glorification of the sovereign in whose behalf it was struck, William III. The like remark applies to the *Medal on the Battle of La Hogue* (1,277); to *The Upper and Lower Houses of Parliament in England* (1,424), where Queen Anne is represented supported by Prosperity, Justice, and Commerce, labelled "Hinc gloria regni," and "Hinc felicitas publica;" to the *Carte du Gouvernement Ecclésiastique d'Angleterre, L'Ordre de cette Assemblée, accompagné de Trophées à la gloire des Savans et des illustres Corps qui font honneur à la Grande-Bretagne* (1,428); to the *Portraits of Six Bishops and Dr. Sacheverel* (1,524); to *The Unfeigned Respect of an English Tory to the Queen of Great Britain* (1,547), portraying "Queen Anne borne by Fame towards a meridian sun;" to *Jacques III., Prétendant d'Angleterre* (1,637); to the print of a medal *Serenissimo Walliae Principi Friderico* (1,820); and to many others as well. After such examples as these, it is difficult to see why some of the drawings belonging to Hogarth's MS. *Peregrination of Five Persons* should have been "omitted as not satirical," while others of those designs, which have a more or less humorous character, are catalogued. Not that we dispute the rightfulness of the omission: but then all the more should numerous other items, whose exclusion would not even have broken the continuity of any series, have been left out.

The translations which appear *passim* throughout the book (and for which, very likely, Mr. Stephens is not personally responsible), are scarcely up to the mark. A large number of them are from lively (or deadly-lively) sallies in the Dutch language, and are meagre and jejune, where something of idiomatic raciness would be in demand. One of the mottoes to No. 1,471, *L'Electeur Banni*, runs thus:—

"K zal strylen als een Alexander
Met dese schroosten-vegers stander."

This is translated:—

"I'll fight like an Alexander
With his chimney-sweeper's stick (standard)."

The words "his chimney-sweeper's stick" are neither correct nor relevant; the "his" ought to be "this;" nor does the parenthesised "standard" appear to be at all appo-

site. In No. 1,589, *Joyes de Paix entre l'Espagne et l'Holland*, the words "waar van men leefd," meaning "whereon people live," are translated "that makes me live." A Spanish quotation to No. 1,338, the Italian etching by Mitelli named *Pace*, fares still worse. In this print, a statue of Peace is represented as tottering on its plinth; four men endeavour to secure it, one of whom, a Spaniard, says: "Y en mis manos, no tengo miedo." Of this speech the etching itself supplies a correct (though misprinted) version in Italian, of which the English equivalent is—"She is in my hands; I feel no fear." The translator gives a very different phrase—"When in my hands, you need not be afraid," which is simply unmeaning. It seems strange that such an institution as the British Museum should not command the services of some person capable of translating aright this very easy Spanish phrase, especially as the correct Italian is there to boot.

In such a book as this, some misprinting of dates is certain and inevitable. Mr. Reid, who signs the introduction, is answerable for saying—or allowing his printer to say—that Charles I. was executed "in January, 1749." This slip can confuse no reader; but another, under the entry No. 1,588, a portrait supposed to represent Lord Bolingbroke, is serious and embarrassing. "The new Countess" (so runs Mr. Stephens's text), "was Miss Gumley. William Pulteney was created Earl of Bath in 1741. They appear to have been married in December 1741, on the resignation of Walpole." Here the second "1741," the date of marriage, ought to be 1714; the exact date of Pulteney's marriage with Miss Gumley was, we believe, September 27, 1714. If Pulteney had married on the resignation of Walpole, 1741 or 1742, he would have been a bridegroom of fifty-nine winters. Or does the compiler intend to imply that the connexion between Pulteney and Miss Gumley, dating from 1714 or thereabouts, was not ratified by marriage till 1741? and, if so, is such an allegation maintainable? A different sort of chronological error is that which has placed item No. 1,470, *The Eastern Sun piercing the Mists of Bourbon*, dated June 21, 1706, after Nos. 1,454 to 1,458, dated between June 27 and September 7, 1706. The attention paid by Mr. Stephens to points of this kind is so manifest that any such irregularity of arrangement catches the eye; a high testimony to his general accuracy.

There is another detail to be noted regarding this subject of *The Eastern Sun [De Ooster Zon] piercing the Mists of Bourbon at the Magnificent Entrance of King Charles III. in Saragossa, and his Procession to Madrid*. The "Eastern Sun" is, as Mr. Stephens remarks, "the sun of Austria;" but he adds an explanatory gloss which we cannot but think far-fetched. "The term 'Eastern Sun,'" he says, "was used in satirical contradistinction to the 'sun' of Louis XIV.; the 'Eastern sun' being that which rose in the East, and was, therefore, the true one." A more simple—and, we submit, more adequate—explanation is that the word which we pronounce "Austria" is properly "Oesterreich," *i.e.* Eastern Empire. Hence, the Sun of Austria

may with obvious propriety be called the Eastern Sun. Another engraving, to which we have already referred, designed by Romeyn de Hooghe, and entitled *L'Electeur Banni, ou Le Capitaine Général du Ban et Arrier-Ban, pour se venger des Victoires emportées par les Alliés en Espagne et aux Pays-Bas*, is explained with less than Mr. Stephens's wonted completeness. The person represented is not simply "a wooden-legged soldier of Louis XIV.," nor is the work merely "a satire on the depressed condition of the French nation in 1706." The French translated title tells us plainly that the protagonist of this lampoon is the banished Elector [of Bavaria]—a point made still clearer in the original Dutch title, *De Vervelde Bander-Heer van Beyeren*. One of the lines of French verse appended to the print announces the same fact: "Le chef du Ban sera moi l'Electeur banni."

Mr. Stephens devotes, as he well may, especial attention to the works by Hogarth, of which a not inconsiderable sprinkling appears towards the close of this volume—to be followed, doubtless, by many more in a future instalment of the Catalogue. If these items, when the series of them is completed, were to be extracted and republished in a separate form, they would constitute probably the fullest and most serviceable list extant of the satirical works of our great master.

W. M. ROSSETTI.

EXHIBITION OF ILLUMINATED MSS. AT THE BURLINGTON FINE ARTS CLUB.

THE friends of the Burlington Fine Arts Club have the opportunity afforded them of inspecting an interesting collection of illuminated MSS. now exhibited in the rooms of the Club in Savile Row. The collection numbers some hundred and fifty volumes, together with several frames containing cuttings, lent by friends and members of the Club. Mr. Bragge, of Sheffield, contributes the largest number; Mr. John Malcolm of Poltalloch, the Rev. J. F. Russell, and Mr. Frederick Locker, lend the choicest specimens; and there are also many volumes from the library of the late Sir William Tite.

Of the whole number of MSS. fully one half are of the French school, and of these a large portion is formed of specimens of the end of the fifteenth and beginning of the sixteenth centuries, the most uninteresting, and, in many respects, the worst period of French illumination. The hard flat surface of the painting overloaded with gold will be recognised in too many instances; and a judicious weeding would have been advantageous. Italy is next best represented, in point of number, by about thirty volumes, besides the majority of the cuttings. England may claim some fifteen; Flanders, a dozen; Germany, eight or ten; Holland, five or six; Spain contributes two or three; Switzerland, one; and even Sweden, one.

By far the most important MS. in the collection is Mr. Malcolm's famous Book of Hours. This wonderful volume, which was brought from Spain to this country about two years since, is probably unique of its kind. It is enriched with an unusually large number of miniatures and borders of the finest order, the work of artists of the Italian and Flemish schools. The MS. appears to have been commenced for Bona of Savoy, who became, in 1463, the wife of Galeazzo Maria, Duke of Milan, and died in 1494; and to have been intended, as the work proceeded, for the use of her granddaughter, Bona Maria, who was born near the end of the fifteenth century, and became Queen of Poland by marriage with Sigismund I. in 1518. The frequent occurrence of her badge and

motto in the borders connects the volume indubitably with the elder Bona; while the insertion of the name "Bona Maria" seems to point to the granddaughter, though she must have been yet an infant while the Italian part of the work was in progress. The MS. contains upwards of sixty miniatures and about one hundred and forty borders of various subjects and designs. The borders and greater part of the miniatures are of Italian art, of the latter part of the fifteenth century, and, though by various hands, their excellence is sustained throughout the volume. The miniatures by Flemish artists are comparatively few, and of somewhat later date, but are the very best of their kind, wonderfully delicate and soft in colouring. In the lower border of one of the pages is a medallion portrait of the Emperor Charles V., with the date 1520. One of the Flemish miniatures likewise bears a date of 1519. When the great rarity of single volumes containing many specimens of fine Italian miniatures is borne in mind, the value of this MS. will be appreciated. It must ever remain a subject for regret that financial difficulties prevented the acquisition of this art treasure for the British Museum.

Of early Italian art, some very interesting specimens are contributed by the Rev. J. F. Russell, in the shape of cuttings from Service Books. Worthy of special notice is a large miniature representing the death and glorification of the Virgin, attributed to Silvestro Camaldolese, A.D. 1350. Whoever the artist may have been, it is a fine composition, the drawing being full of grace and the colouring brilliant. Perhaps of still greater interest are two remarkable cuttings which adorn the wall at the farther end of the room; both apparently from one MS. of the latter half of the fourteenth century, painted in Giottesque style, from Murano. The larger piece contains a group of the Apostles, perhaps representing the scene after the Ascension; the smaller one depicts the death of the Virgin. There is great boldness in the designs, and the attempt of the artist to impart a rugged massiveness to the heads has not been without success. A curious group of cripples is introduced into the smaller piece. Other specimens of interest, but of later date, are: a cutting containing a water scene of St. Peter fishing, in which the distant landscape is cleverly managed, of the end of the fifteenth century; a miniature, belonging to Mr. Fisher, representing a group of Saints, with rabbits in the foreground, of the late fifteenth century; an initial letter containing an "Ecce Homo" in the style of Giulio Clovio; and a piece by Buonfratelli, *circa*. 1555.

Among the works of Flemish artists Mr. Fisher's large Book of Hours is conspicuous. The miniatures and borders, of the end of the fifteenth century, are unusually full, and are generally well executed. Mr. Locker's miniature of the Virgin and Child, surrounded by female saints, is a charming example of Flemish art of about 1470-80. Why it should be ascribed to Margaret van Eyck is not very apparent. Mr. Locker also exhibits a leaf from a delicately-painted Calendar, of the sixteenth century, which originally represented the agricultural occupations of the twelve months in six leaves. Two of the leaves are preserved in the British Museum. Some of the small Books of Hours of this school will repay examination. A good example occurs among Sir W. Tite's MSS.

There are only a few superior examples among the French MSS. of the fifteenth and sixteenth centuries. One of the best, of the middle of the fifteenth century, is a large Book of Hours, belonging to Mr. Bragge, painted very much in the style of the Bedford Missal. Others of later date are interesting for peculiar styles. In one of Mr. Bragge's MSS., of about 1450, may be seen a curious representation of the Trinity. The Son sits in the lap of the Father, and the Holy Ghost, as a child, in the lap of the Son. All three Persons have the left hand on an open book, and the right arm upraised.

The best specimen of English work is a Missal, having a well-executed miniature of the Crucifixion, and a handsome border, of the peculiar English style, of the middle of the fifteenth century. It belongs to Mr. Russell. Another handsome English MS., a Psalter, belonging to Mr. Malcolm, is chiefly interesting from its having been in possession of Henry de Beauchamp, Earl and Duke of Warwick, *ob.* 1445. His signature, though half erased, is still legible at the beginning of the book. At the end are some additional miniatures in a superior style, executed by an Italian artist later in the century.

We must not forget to notice one of the most remarkable pieces in the whole collection, belonging to Mr. Locker: a frame containing four miniatures by a German artist of the sixteenth century. The subjects are a group of persons (no doubt portraits) adorning the Virgin, the Crucifixion, the Annunciation, and St. John in Patmos. Nothing can exceed the delicacy of the drawing, the wonderful details of which require a close examination. With this piece may be compared the ornamentations of a small MS. lent by Mr. Francis Cook.

There is no lack of older specimens of illuminated MSS. Several Psalters, a series of Bibles, and other MSS. of the thirteenth and fourteenth centuries; and a few of still older date. A Psalter of the thirteenth century, of Swedish origin, exhibited by Mr. Bragge, is a rarity of which even the British Museum cannot boast.

The collection has been arranged by the Rev. W. J. Loftie, who is also engaged in preparing a catalogue.

E. MAUNDE THOMPSON.

"ROUND THE WORLD."

MR. WILLIAM SIMPSON, the multifarious travelling artist who has been well-known in many ways and many regions ever since the Crimean War, has opened at No. 191, Piccadilly, an exhibition which he names "Round the World, or Pictures from the Four Quarters of the Globe." The subjects are not extremely numerous—186 in number—but the reader may form some idea of the extent of the field whence they have been culled when he is told, as the catalogue tells him, of "France [the Franco-German War, and the Communal Siege], Italy, Circassia, Holy Land, Egypt, Red Sea, Abyssinia, India, Ceylon, Straits of Malacca, China, Japan, Pacific, San Francisco, Modoc War, Yosemite Valley, Salt Lake City, Mammoth Caves of Kentucky, Niagara, &c." The more immediate occasion for the production of the water-colours, and consequently for the exhibition itself, was the journey which Mr. Simpson made to China and Peking in 1872, to record for the *Illustrated London News* the ceremonies attending the marriage of the Chinese Emperor: hence he went on to Japan and America. Many of the sketches proper to this tour have been engraved in the newspaper referred to. Others of the drawings in the gallery belong to earlier tours made by the artist—as to the source of the Ganges, Tibet, the Holy Land, Abyssinia, and Russia. The exhibition is of course full of curious and interesting subject-matter; travellers will relish it, and the untravelled enjoy it. A large proportion of the works are water-colours in the ordinary sense of the term; others are executed with the brush in black and white. As regards artistic excellence, it may perhaps be said that the majority of the designs are up to the average of such as were previously known from Mr. Simpson's hand; but that he does from time to time produce something more complete and noticeable than any of those here collected.

W. M. ROSSETTI.

MR. NEWTON'S FIRST LECTURE ON MR. WOOD'S DISCOVERIES AT EPHESUS.

ROYAL INSTITUTION (March 7).

THE principal discovery made by Mr. Wood at Ephesus was that of the site and remains of the Temple of Diana, one of the seven wonders of the

ancient world. After a brief notice of these seven wonders, the lecturer proceeded to give a sketch of the history of Ephesus from the earliest times. According to local legends, the worship of Artemis had existed there long before the arrival of the Ionian colony under Androklos, who is said to have established himself at Ephesus B.C. 1044. The lecturer then pointed out on a plan of Ephesus the probable position of the first Ionian settlement on the hill Koresos, from which the Greeks gradually spread over the rest of the site now occupied by the ruins of Ephesus.

The colony founded by Androklos was strengthened by new settlers from Greece; the native population of Carians and Leleges was driven out of the strong positions before occupied, and dwelt round the temple of Artemis, coming to a friendly understanding with the invaders, as was the case with the Greek colonies at Halicarnassus and elsewhere on the west coast of Asia Minor. About B.C. 700 the rise of the Lydian dynasty under Gyges began to affect the development of the Ionian cities. It was the policy of the Lydian kings to attack the Ionian cities one by one, and this policy, carried on by Sadyattes and Alyattes, who especially attacked Miletus, was completed by Croesus, who besieged Ephesus, and would have taken it, had not his kinsman, Pindaros, the principal man in Ephesus, attached the city to the temple of Artemis by a rope. In other words, he dedicated it to the goddess, placing it under her protection. In consequence of this, Croesus spared the city, though he changed the constitution and banished Pindaros. Croesus, though hostile to the Greek city, at the same time showed his reverence for the Ephesian Artemis by dedicating golden bulls and the greater part of the columns in her temple, then being built. The priests of Artemis then, as in after times, had a decided bias in favour of the ruling Asiatic dynasty as against the Greek settlers; their sympathies were, like the worship of Artemis itself, rather Asiatic than Hellenic. In the time of Darius, Ephesus joined the Ionian revolt, but did not play a distinguished part in it. After the defeat of Xerxes, Ephesus was a tributary to Athens; but after the victories of Lysander, became the head-quarters of Spartan operations in Asia Minor.

From this time onwards to the Roman conquest, we find Ephesus always courting the strongest power in that part of Asia Minor. Lysimachus enlarged the city, transferring to it the inhabitants of Lebedus and Colophon, and surrounding it with fortifications which exist to this day. He changed the name of the city to that of his wife, Arsinoe, but the Ephesians did not long keep the new name. The city afterwards passed into the possession of the Seleucidae, and, on the defeat of Antiochos the Great, was added to the kingdom of Pergamos by the Romans, and afterwards became the capital of the Roman province of Asia. From the time of Lysander, who first developed the commerce of Ephesus, it constantly grew in importance; its merits as a strategic position commanding the west coast of Asia Minor are pointed out by Polybius; it is probable that its strength as a military position was greatly enhanced by the circumstance that its port was at some distance from the sea, and could only be approached by a narrow winding channel. When Mithradates suddenly massacred all the Romans in Asia Minor, the Ephesians actively aided him, for which they were severely punished by the Romans. In a very interesting decree, however, discovered at Ephesus, and published by Mr. Waddington, they plead that they were forced to join Mithradates against their will, and profess the utmost loyalty to the Romans. The political history of Ephesus terminates at the beginning of the Roman Empire. During the Imperial period Ephesus claimed the proud title of Metropolis and first city of Asia, and is chiefly distinguished on account of the celebrity of the Temple and the spread of the worship of the goddess Artemis. The city was

sacked, and the Temple burned by the Goths, A.D. 262. Justinian probably rebuilt Ephesus, which afterwards passed into the hands of the Seljukian Emirs of Magnesia. A treasure of silver coins, mostly of Western states, of the thirteenth and fourteenth centuries, was found by Mr. Wood at Ephesus. Among these were some struck at Ephesus by the Christian subjects of Saroukhan, Emir of Magnesia, early in the fourteenth century. On these coins Ephesus is called Theologos, a name afterwards corrupted into Aiaroluk. After the Turkish conquest a fine mosque was built at Ephesus by Selim I.; but the place had become a wretched village by the end of the seventeenth century, when the early travellers visited it.

ART SALES.

M. J. FAU's collection of eighteenth-century portraits of the French School, of which we spoke in our last number, took place as announced. The following were among the most important items: *Portrait of Anne of Austria, and Louis XIV. as a child*, Beaubrun, 4,000 fr.; *Portrait of a Young Lady of the end of the reign of Louis XIV.*, Largillière, 9,150 fr.; *Portrait of a Young Woman*, Largillière, 4,000 fr.; *Portrait of a Woman, with Landscape*, Largillière, 1,550 fr.; *Portrait of Forest (his father-in-law)*, Largillière, 3,000 fr.; *Portrait of the Duchess of Portsmouth*, Mignard, 2,900 fr.; *Portrait of Mlle. Victoire as Diana*, Nattier, 9,100 fr.; *Portrait of a Young Woman*, Nattier, 2,000 fr.; *Ditto*, Tournière, 1,000 fr.; *Portrait of a Singer*, Trinquette, 1,000 fr.; *Portrait of a Lady of the time of Louis XV.*, Tocqué, 960 fr.; *Portrait of the Marquise d'Espagnac*, Heinsius, 1,520 fr.; *Landscape*, Huysmans, of Malines, 3,750 fr.; *Piron, Collet, and Vadé (at table and breakfasting together)*, Jeurat, 730 fr.; *Diana and Calisto*, Leclerc, 1,950 fr.; *The Musician*, Lépicié, 900 fr.

THE *Times* announces that the very choice collection of water-colour drawings and modern foreign pictures belonging to the Earl of Dunmore was sold on Saturday last, by Messrs. Christie, Manson, and Woods. The drawings were 143 in number, and produced collectively the sum of 6,716*l.* The more admirable among them, with the prices each sold for, were—*Beauvais*, 399*l.*; *Vicenza*, 110*l.* (both by S. Prout); *Scottish Highlands*, by H. B. Willis, 115*l.*; *Egg Poachers*, by Birket Foster, 162*l.*; *A Boy Reading—candle-light*, by W. Hunt, 150 guineas; *Obercesel*, 190 guineas, and *Burgos*, 240 guineas (both by D. Roberts); *Scarborough*, 490 guineas, and *Loch Lomond*, 225 guineas (both by Copley Fielding). These were all purchased by Messrs. Agnew. *A Devonshire Landscape*, by J. M. W. Turner, 220 guineas (Wallis); three by C. Stanfield—*On the Clyde*, 210 guineas (Nicolson); *On the Solway*, 120 guineas (Vokins); and *Loch Lomond*, 135 guineas; *Tintern Abbey*, by D. Cox, 155 guineas; *An Arab Encampment*, by J. F. Lewis, 310 guineas; *Whitstable Fishing Boats*, by E. Duncan, 400 guineas (Clark); *A Coast Scene*, by W. Collins, 190 guineas (Vokins); *The Innkeeper's Daughter*, by Sir J. Gilbert, 150 guineas (Lloyd). Among the pictures were two small but highly-finished paintings—one, *The Janissary*, by Bague, 400 guineas, the other, *Dispute d'Arabes*, by Gérôme, 1,000 guineas—bought by Mr. Wallis. A painting by J. J. Tissot—*Avant le Départ*—was bought by Mr. Alexander for 900 guineas. From another collection—*The Arrest for Witchcraft*, by J. Pettie, sold for 370 guineas (Agnew); *The Burning of the Books (Don Quixote)*, by J. C. Horsley, for 305 guineas; *The Story of a Life*, by W. Q. Orchardson, for 325 guineas; *The Marriage of the Prince of Wales*, by W. P. Frith, 705 guineas; and *Flood in the Highlands*, by Sir Edwin Landseer, a small replica of the celebrated large work, sold for 750 guineas (White).

A COLLECTION of pictures of the modern French and Belgian schools, received from the continent,

was sold on Monday by Messrs. Christie, Manson, and Woods. *The Return from Church and The Little Favourites*, two pictures by Bakolawicz, sold for 260 guineas; *Dressing the Child*, E. Frère, 145 guineas; *The Masters Absent*, by L. Rossi, 170 guineas; *Happy Parents*, by Emile Lévy, 250 guineas; *Maternal Happiness*, by L. Gallait, 750 guineas; *Bischari Warrior*, by J. L. Gérôme, 250 guineas; *The Jugglers*, Herman Tenkate, 205 guineas; *A Fête on the Bosphorus*, 235 guineas; *A Marine View*, 475 guineas; *The Siesta*, E. Fromentin, 370 guineas; *Rendezvous of Arab Chiefs*, by the same, 850 guineas; *Thieves in a Fair*, by L. Knaus, 565 guineas; and a grand picture of Baron Henry Leys, *The Declaration*, 1,110 guineas.

At a sale of furniture, &c., which has taken place this week at Dornden, near Tunbridge Wells, one of the lots was a finely-carved antique oak four-post bedstead, brought some time since from Raby Castle, and said to have originally belonged to John of Gaunt. Its richly embroidered arras hangings, together with a coverlet worked in amber silk flowers, is stated to be of the time of Queen Elizabeth.

NOTES AND NEWS.

AN important collection of paintings of the English School, including works by Constable, Ladbroke, and Turner, was sold yesterday at the Hôtel Drouot.

It is stated that the recent visit of the Duc d'Aumale to England was for the purpose of selecting certain pictures from his gallery at Twickenham for M. d'Haussonville's loan exhibition, which, as we stated last week, is to take place at Paris in the spring.

THE death is announced of M. Victor Baltard, Director of Works to the city of Paris under M. Haussmann, and architect of various additions to the Hôtel de Ville, of the new Stamp Office, and of the Halles Centrales. He also decorated or restored Saint-Germain des Prés, Saint-Eustache, Saint-Séverin, and Saint-Etienne du Mont; and superintended the most brilliant of the fêtes that distinguished Paris under the Empire. His last and least successful work is Saint Augustin's at Paris.

A WONDERFUL collection of violins, signed by the great Italian instrument makers of the sixteenth and eighteenth centuries, will shortly be sold at Havre.

Two French sculptors, MM. Chapu and Gruyère, have just finished two allegorical figures destined for the new Prefecture of Police. The figures represent Vigilance and Security. The vigilant police watches while the city sleeps in security. We would only ask if Paris is the city thus represented?

AN exhibition of the works of living artists, both native and foreign, will be held at Amsterdam in the September of this year. Intending exhibitors must send in their works, with their names and addresses, between August 10 and 24. Letters and contributions to be sent to the Exhibition Committee, Academy of Fine Arts, Oude-manhuispoort, B 105. The names and addresses of the contributors will be given in the catalogue, and the municipality of Amsterdam will award six gold medals, of the value of 100 florins each, to the most successful competitors.

THE sub-committee for Ancient Lace held its first meeting at the Albert Hall on Tuesday, the 17th. Various letters were read, among others, one from H.M. the Queen of the Netherlands, regretting her inability to contribute to the Exhibition. The Committee then proceeded to examine the specimens sent in, among which was a superb flounce, from the Countess of Chesterfield, and fine examples of Brussels and Alençon point from the Marchioness of Exeter, Marchioness of Waterford, Lady Marion Alford, Mrs. Alfred Morrison, &c., and the promise of much more from other collectors of lace. The Exhibition promises to be very extensive, and the specimens of

the highest order. To add to its interest, lace workers are engaged from Bedfordshire, Honiton, and Belgium, with pillows and bobbins, to show the process of lace-making.

THE city of Geneva will not, it seems, derive much benefit from the late Duke of Brunswick's affection. As a result of arbitration on the subject, it has been decided that all the objects of art carried off by the Duke in 1830 from Brunswick, and left in his will "to the country of J. J. Rousseau," shall be restored to Brunswick. This is hard, considering that, as we stated last week, poor Geneva is doomed to be encumbered and disgraced by a monument to its patron. The *Globe* has stated also that Geneva will return to the present Duke of Brunswick all the art treasures belonging to the Brunswick family. Geneva is right in thus declining to profit by a dishonourable generosity. It would have been as well perhaps if London, in a recent instance, had acted in the same way.

THE Cercle de l'Union Artistique has opened its usual spring exhibition at the Place Vendôme. Its winter exhibition of water-colour drawings, before mentioned in the ACADEMY as the first water-colour exhibition held in Paris, was most successful, but the present show of oil paintings is reported to fall below average excellence. This does not augur well for the Salon, to which the exhibition of the Place Vendôme is a sort of introduction.

THE "Société des Amis des Arts de Paris" opens an exhibition this month at the Galleries Le Peletier. Sir Richard Wallace, who is a member of this society, has been chosen to act on the committee. Only artists who are invited by letter can send works to this exhibition. It will be open for two months.

A PUBLIC subscription has been set on foot in France for the erection of a monument commemorative of the defence of Belfort.

SEVERAL works of art from the old Imperial residences have been placed in the Louvre. The *Chronique* especially mentions a splendid porphyry vase and two fine bronze statuettes, representing Henri IV. and Marie de Medicis, that have recently been placed in the Apollo gallery.

SOME Gaulo-Roman remains have been discovered in Paris on the demolition of the last remaining house in the now historic Rue des Marmousets, consisting of large stones with fragments of arms, legs, and torsos sculptured on them, which evidently formed part of the decoration of a large building. Some fragments of the same kind were discovered in 1829, at a depth of ten feet, under the church of Saint-Landry, not far off; and it is suggested that these remains, which are now preserved at the Palais des Thermes, and those just discovered, belonged to a triumphal arch.

CERTAIN American sculptors at Florence are the subject of a rather warm discussion at present in their native country. They are charged with buying or stealing, more or less completely, their original design; while their modelling is done, sometimes almost entirely, by some needy Italian artist working for a wretched daily pittance. The work thus produced is largely bought at a great price by wealthy patrons, anxious to encourage "native genius." It is stated that there is one gentleman, aged twenty-eight years, "whose works are already so numerous, that artists who do their own modelling declare that, from the foundation of the world till now, no other human being has ever been possessed of the physical strength and health necessary to the production of so great a show." The practice in question was strongly denounced by the late Mr. Powers.

A PORTION of a marble column, ornamented in bas-relief with figures of men and horses, has been discovered on the shores of the Sea of Marmora, and is believed to have formed part of the Arcadius

Column, which remained standing more than 200 years after the taking of Constantinople by the Turks, and was not destroyed till towards the close of the seventeenth century. The entire surface from the base to the capital was ornamented with bas-reliefs of the victories of Theodosius the Great, while the interior was pierced with a winding staircase which gave access to the summit, and it is asserted that the column owed its destruction to the complaints made by the Faithful that the Franks were enabled by means of these stairs to attain a height from which they could, undetected, overlook the harems and pleasure-gardens of the cities.

These remains differ so greatly from the description given in a rare work by a Jesuit father, with an engraving of bas-reliefs copied, as he states, from the drawings of Gentile Bellini, an Italian painter in the service of Mahomet the Conqueror, that the authenticity of his description and drawings is matter of grave doubt.

AN interesting discovery has recently been made at Cannstadt, where some workmen, while engaged in digging out the foundations for a new house, found a Roman altar about four feet in height and formed of the granular sandstone so commonly employed in Roman architecture. The altar, which lay at the base of a pedestal from which it appeared to have been severed through the action of fire, is ornamented on the four sides with tolerably well-preserved figures of Mercury, Hercules, Minerva, and Vesta. In the immediate neighbourhood were discovered a large mass of ox-bones, numerous fragments of terra-sigillata amphorae and tesserae, and an iron instrument which possibly had formed part of a lock. These objects were found five feet below the surface, and not far distant from remains of Roman architecture, which are conjectured to have formed part of the workshop of an artificer in bronze, as numerous spoons, knives and forks, with fragments of half-completed bronze articles, were discovered near the spot. The traces of a Roman road, which may be followed from the Altenburg plain in the direction of the Neckar, and are in the immediate line of these excavations at Cannstadt, render it not improbable that this altar may have been a votive-monument erected on the track of this thoroughfare.

THE Exleben fund of 1,000 thalers, intended by its donor for the purchase of works of art by German sculptors or painters studying at Rome, has been this year appropriated to the purchase of pictures by Romako and Harter, and a bust by Karl Regas. The selection rests with a committee appointed annually by the Society of German Artists at Rome.

MR. MADOX-BROWN has lately completed an oil-picture of *Cromwell on his Farm*, a composition developed and modified from a water-colour which he painted several years ago. The work, which is about 4½ feet in height, by 3½ in width, has been on view at his studio, 37, Fitzroy Square, during the present week. It is very concentrated in idea, and rich in detail of subject-matter; indeed, it is seldom that a picture of these moderate dimensions, and having its main interest centred in a single figure, is made to comprise so many points of significant thought. Cromwell, a vigorous, homely, enterprising country squire of the age of some thirty years, a man "convinced of sin" and "converted," is represented as riding about his grazing farm near St. Ives, on a sinewy white horse that has seen some service; on his collar we descry the spot of blood from shaving which forms a well-known detail in the account of his somewhat negligent attire and bearing left to us by one of his parliamentary colleagues. His left hand, with a finger inserted between the leaves, holds a worn parchment-bound Bible; also an oak sapling which he may have plucked to use as an improvised whip, and which dangles loosely downwards. The horse has stopped to browse the herbage from a bank hard by a low fence; a lamb is doing the like. A sow with

her litter is trundling along the deep-rutted road, and will be between the horse's legs in a moment: much the wont of "the swinish multitude." Cromwell is absorbed in thought. Just where he pauses, one of his labourers, an elderly, hard-worked man, has made a bonfire of waste leafage, and is feeding it from his pitchfork. Oliver's memory reverts gloomily to some scripture-text about "brands fit for the burning," or "Lord, how long wilt thou hide thyself? for ever? And shall thy wrath burn like fire?" The state of England and of man weighs as a burden on his mind. His head is a triumph of thoughtful and masterly painting—very simply done withal: the expression is intense as a matter of character, not merely forcible (which is a much minor point of attainment) as a matter of momentary feeling. The brooding yet not hard-set eyes, the mouth closed and all but clenched, are naturally the most emphatic traits in a face where nothing is unconvulsive to one main impression. Cromwell thinks much, sees little, and hears less: it does not occur to him that a buxom, good-humoured serving-wench, who appears in the right-hand corner behind the fence, is calling him to dinner, holding a quacking duck under her arm. As the first mere call had produced no effect, she is now vociferating with hand to cheek, and an amused expression of countenance—"Master is really so very odd." Mrs. Cromwell, with a boy and a baby, appears in the distance, close to the three-gabled manor-house. Two men engaged in hedging and weeding, and many oxen, stolid mostly, and here and there skittish or contumacious, indifferently well herded by a red-haired youth who brandishes his lean arms, occupy the middle distance. Behind comes a plashy stream, and the town of Huntingdon, with its church-tower and other buildings, all blue and blurred in a drenching shower, for the weather is broken over there, although the foreground has not yet resigned its sunshine. There is no part of the picture without its important meaning, bearing upon Cromwell in his present and forthcoming relation to the facts of his time. These subsidiary indications are not obtruded, nor yet remote or wire-drawn: as in Nature, they come in casually, but the hints which they drop are broad enough, and can be caught by such as list to take them. This picture, which presents a very unhackneyed and original arrangement to the eye, is certainly among the finest that Mr. Madox-Brown has painted. It possesses in a high degree the historical and biographical character; and unites to its other merits the not unimportant one of being really entertaining to look at and follow out. Deeply serious in purport, what it presents direct to the eye remains nevertheless without overlaying of any kind—a grazing farmer of the mid-seventeenth century riding round his estate, with its labouring and its quadrupedal population.

MR. ANDREW MACCALLUM writes to the *Times* from Korosco, Nubia, February 16, as follows:—

"It may interest your readers to learn that at the south side of the great temple of Abou Simbel, I found the entrance of a painted chamber rock cut, and measuring 21 ft. 2½ in. by 14 ft. 8 in., and 12 ft. high to the spring of the arch, elaborately sculptured and painted in the best style of the best period of Egyptian art, bearing the portraits of Rameses the Great and his cartouches, and in a state of the highest preservation.

"This chamber is preceded by the ruins of a vaulted atrium, in sun-dried brickwork, and adjoins the remains of what would appear to be a massive wall or pylon, which contains a staircase terminating in an arched doorway leading into the vaulted atrium before-mentioned.

"The doorway of the painted chamber, the staircase, and the arch were all buried in the sand and debris. The chamber appears to have been covered and lost sight of since a very early period, being wholly free from mutilation and from the scribbling of travellers ancient and modern. The staircase was not opened until the 18th, and the bones of a woman and

child, with two small cinerary urns, were there discovered by a gentleman of our party buried in the sand. This was doubtless a subsequent interment. Whether this painted chamber is the inner sanctuary of a small temple, or part of a tomb, or only a speos, like the well-known grottoes at Ibrim, will be a question for future excavators to determine."

MADAME LENOIR-JOUSSEAU, who left a sum of ten million francs to the city of Paris to found a hospital, has bequeathed to the Museum of the Louvre her husband's collection of miniatures, snuff-boxes, &c., valued at 800,000 francs.

THE contributions of the Antwerp artists to the International Exhibition of the present year have been, according to the *Journal des Beaux Arts*, on view at the Cercle Artistique in Antwerp. Among them are landscapes by Messrs. Van Luppen, Wüst, Rosseels, and Piéron; *Sunday Afternoon*, by M. Bource; two new compositions by Van den Bussche; an interior, by M. Webb; and works by MM. van der Ouderaa, Quittion, De Bruycker, Van Lerijs, W. Linnig, junior, and Verhoeven-Ball. Sculpture is represented by some terra-cotta busts by M. de Braekeleer, and a work in marble by M. Dekkers, *Plus d'Amour*.

THE extensive works at present going on in Rome for improving the sanitary condition of the city, and for the building of new streets, have yielded the most interesting results by bringing to light numerous hidden features of ancient Rome. Scarcely a week has passed since the new year without revealing more or less perfect remains of sculpture and architecture; and during the month of February more than two thousand fragments of stone-inscriptions have been recovered, the greater number of which were, however, not sufficiently complete to admit of being satisfactorily deciphered. A highly interesting discovery was recently made outside the walls, near Tor-Marancia, to the right of the Via Ardeatina, where the workmen employed in the catacombs of St. Domitilla came upon the remains of a basilica of moderate dimensions, which had been completely buried beneath the surface. The excavations, which are now being prosecuted with great care under the direction of the Chevalier de Rossi, have already revealed the existence of rows of *loculi*, or separate graves, and the pediments of the pillars which separated the middle aisle from the transepts. The building was connected directly with the catacombs below.

THE *Times* of the 14th inst. records the discovery of about fifty Roman coins in the neighbourhood of Bideford. A Barnstaple correspondent writes that a gentleman named Glendenning, who was staying at Bideford, while out for a walk one day last week, chanced to stumble over an old tree near the roadside. As he did so he heard a jingling sound like metal, that struck him as being curious. He examined the tree to find out the cause of the sound, and discovered at its roots, the soil over which he had loosened by his fall, a number of valuable coins in a good state of preservation. Several of them are "sestertii of the Emperors Diocletian and Constantius, ranging from the middle to the latter part of the third century of the Christian era. Others are denarii of Domitian, Alexander and Severus, having in addition to the inscriptions various emblems, such as the sacrificial altar, the legend 'Princeps Juventutis,' and figures of Liberty and Concord," and all are stated to belong to the period of Roman domination in Great Britain.

M. RENÉ MENARD, in the current number of the *Chronique*, follows up the indignant articles of M. de Lajolais on the subject of the antiquities of the Louvre, by demanding to know why, when there are so many excellent catalogues issued of all the other departments of the Louvre, there should be none of the Greek and Roman antiquities. For twenty-five years, it appears, no complete catalogue of this department has been published by the Conservatoire; and not only so, but the instructive catalogues of Visconti and Clarac previously issued have, for some reason or other, been withdrawn

from circulation. The troubles that France has passed through of late have, no doubt, unsettled her artistic as well as her political interests. There was no time for preparing new catalogues of the treasures of the Louvre when the treasures themselves were menaced with destruction; but now, after two years of peace, the Conservatoire of the Louvre ought surely to overcome the paralysis to which it has for a time succumbed. French papers are certainly doing their utmost to stir its indignation, and M. de Chennevières will no doubt prove a propelling force that will set its inert mass in motion.

THE STAGE.

THE THEATRE IN PARIS.

THE week has given the Parisian public two new pieces to talk about: first, *Le Candidat*, at the Vaudeville; and then, at the Odéon, *La Jeunesse de Louis Quatorze*. Something of the interest which was taken before its production in M. Gustave Flaubert's comedy (the first piece of the two) was due to the literary and popular success obtained by his best novel, *Madame Bovary*; something perhaps to the fact that since the production of that romance its author had done nothing quite worthy of its success. *Le Candidat* has failed absolutely—so absolutely that it has been already withdrawn from the bills, and in the place of it we have again Sardou's extravagant comedy *L'Oncle Sam*.

There was scarcely anything in *Le Candidat* to avert the expression of popular disapproval. The characters were not new; the story was not interesting; the writing was not brilliant. All knowledge of stage requirements was wanting to the piece; but the entire absence of all *habitude de la scène* would have been forgiven the author, by a public disposed to be benevolent, had the author shown any original quality either in conception or in execution—had he, in a word, given his public any excuse for applauding. But there was none whatever. The typical person, whose claims gave a title to the piece, was not a type, but an exception. M. Rousselin's stupidity and lack of political faith were greatly exaggerated. Turning so soon from right to left, from left to right, at the will of every insignificant voter—bribing here and bribing there with open hand—he could not have eventually succeeded. His rivals, who only appear on the political platform that they may be bought off at his expense, are also caricatures. His wife is a caricature; for when she has a lover it is not that she likes him, but that she wishes him to be disposed to help her husband. The daughter is a caricature; the journalist is a caricature. The work is that of a man who has seen the world too much *en noir*. By the side of M. Flaubert, Alceste would hardly appear to be a misanthrope—he would appear, instead, a credulous admirer of mankind.

There was every reason to suppose that *La Jeunesse de Louis Quatorze* would be a success, nor has the hope been disappointed. The piece was the work of a dramatist who understood the temper of Parisian audiences thirty years ago, and the work was retouched by a dramatist who understands nothing if not the Paris of to-day. The scenery was good, the costumes were more than usually elaborate and correct, the rehearsals had been superintended with the utmost care, and the acting has proved to be sufficiently able. The honours of the evening fell to Lafontaine, who represented Mazarin, by a somewhat delicate compromise (as to his bearing) between the generally accepted Mazarin of history and the new Mazarin of the elder and the younger Dumas. The honours certainly were his, but Mademoiselle Petit—struggling under the disadvantage of momentary illness—has also been commended. M. Duquesnel, the director of the Odéon, may congratulate himself on having provided, probably for several months to come, for all the wants of his audience. The Odéon is a large theatre: often a deserted

one. For once its size will be an advantage to it, for it can hardly be doubted that all Paris will hasten to see *La Jeunesse de Louis Quatorze*. The presentation of this piece on the stage of the capital has given rise, let it be said in conclusion, to several interesting little arguments. One scene realises Gérôme's famous picture of Molière sitting down to dinner with his monarch. It seems that the tradition of Molière dining with his master cannot be traced back further than to the epoch of Louis the Sixteenth. Evidence seems to make the story improbable; at all events, most people are disbelieving it. But the irony of the situation suited Gérôme's brush and Gérôme's mind; also the thing pleases actors and the un-Philistine public, and looks effective enough to be allowed to remain on the stage of a theatre.

THE ACTING OF MR. HENRY IRVING.

THE career of Mr. Irving may be adduced in confirmation of a little theory which we set forth, imperfectly enough, a few weeks ago—that, in spite of many disadvantages, a provincial theatre is an actor's best training-place. Bristol and Bath were once the accepted nurseries of the London stage, and not a few of the best players even of the contemporary Theatre first trod the boards in parts of any importance at that old Bristol playhouse which Garrick used to praise so warmly. But Mr. Irving is not one of these. He acted, we believe, at Oxford and in the North. He played two or three parts in London before he was quite recognised by the critics, and one part more before the general public confirmed the critics' praise. But it is not altogether fair to claim only for the critics the merit of having discovered Mr. Irving's capacity, when the truth is, that the actors themselves—who have the credit of being as jealous of their brethren in prosperity as they are generous and watchful of their brethren in adversity—seem very early to have formed the opinion that Mr. Irving was meant to be illustrious.

The actor's first great part in London was that of Digby Grant in the *Two Roses*—a melodramatic villain, with a touch of comedy to save him from being out of place, in one of the brightest and most original stage works of our time. No part has ever fitted Mr. Irving more exactly; for while it displayed his merits, it concealed his defects. We have heard since childhood that the world's a stage, and *all* the men and women merely players; but we have found also that some men are more of players than others. Now Digby Grant was wholly a player—Mrs. Skewton herself was not more entirely artificial. The needy proud man was for ever *posing*; for ever playing his part; and not until Mr. Irving had passed from this character into some other, did we perceive what was his own difficulty in being quietly natural. It was natural to Digby Grant to say "Mrs. Cupples" in the tone of one summoning that woman to the bar of judgment, and seemingly it is natural to Mr. Irving to do the same. To do a commonplace unnoticed act with an air of deep despair and tragedy has ever been the privilege of accepted actors. Mrs. Siddons stabbed her potatoes at dinner-time, and was the very Tragic Muse that Sir Joshua painted her, for all that; and so not all Mr. Irving's artificial way of greeting can seriously detract from the effect he produces in his better moments, when remorse or devotion is expressed as neither has been expressed by any English actor in our time.

But the facts that Mr. Irving in quiet moments is sometimes very artificial, and that he carries into each part his own mannerism—the measured step, the drawl, and in moments of exaggerated passion the high scream, which is terribly womanish—should not blind us to the truth, that all these faults are not the body of his acting, but the morbid growth upon it. Here it is quite unnecessary to call attention to the reality and strength of his performance whenever intensity is the quality that is needed by the part. The tragic

portions of *The Bells*, the vehement passages in *Richelieu*, have had the praise that is their due. Excellence in these things is what the public can see soonest. Criticism has little to say of them, and what it has to say should be said with some restraint of praise, for public approval has already done something to damage Mr. Irving in these things. He has yielded a little, not consciously, to the pleasure of wonder-seeking playgoers, who care not for truth, but for violent shocks to rouse them, and for whom no contortion is too horrible, and no scream too piercing—he has yielded a little to their pleasure, we say, already, by the prolonged death-tortures of Eugene Aram, and even by the too hateful ghastliness of the dying landlord in *The Bells*, which fulfils after all but imperfectly the aim of tragedy, since it does not “purify by terror and pity,” but only frightens people into un-serviceable hysterics. The one thing which Mr. Irving sometimes lacks, almost at the very moment that he is magnificently forcible, is the classic virtue of moderation, which Ristori has when she is most passionate—which Desclée had even when she was most irritably writhing under that *mal du dix-neuvième siècle* of which at the theatre she was the supreme exponent. Irving is often lacking in that quality, in common probably with Rachel in days that were her best: certainly in common with her in days that were her latest and worst.

But it is the suggestiveness and thoughtfulness of Mr. Irving's acting that make its real value and most lasting charm. He is a master of subtle double effects, which we find often in poetry and in landscape, but very seldom in acting, which generally has as much as it can do to express one thing at a time, and only too often expresses that with pitiable imperfection. Sometimes Mr. Irving will give the utmost meaning to a quiet and simple and seemingly not very suggestive phrase. In *Philip*, thinking of his brother and himself, he says slowly, “There was never much love between us,” says it slowly, calmly, with a world of regret, so that you seem to see backwards into unnumbered bickerings that are past and gone, and forward into the weight of disappointment which hangs over Philip, who knows too well that his future will be what his past has made it. Does the reader, who is a playgoer too, recall the subtlety of expression and gesture which accompanies the recital of the ballad in *Charles the First*? The king lolls on the green sward, now fondling, now lazily tossing his children, who ask for the often told ballad; and Mr. Irving repeats the ballad again, and shows you very plainly that it is not at all in his thoughts. His children like the story of it, follow it with interest; but he—his mind is full of other things, and for him the ballad serves quite a different purpose; he is lulled a little by its monotonous roll, as he is soothed for the moment by the sunshine and the air; but this monotonous roll proceeds almost mechanically, though with a certain artist's habitual care for its peculiar music, and his thoughts are very far away.

Why take up little points like these, and make even more of them than of the fine moments when high passion does not go wrong? Because the quieter moments, when they are so charged with suggestions, show even more plainly than any others that it is an artist who is at work: a man with whom voice and face and gesture are indeed much, but who knows that they are still but instruments, and at the best imperfect ones, and that the mind itself—the subtle intention—can alone give them their worth. At his best times, Mr. Irving, like every high actor of real dramatic power, *reveals* rather than depicts. He is strong enough—and in order to be generally recognised and popular, an actor *has* to be strong enough—in depicting an emotion which we know beforehand, and classify at once, as rage, love, remorse; but his finer strength consists in the seizure and suggestion of the unsuspected meaning lurking under a simple phrase, and in the analysis of double motive and conflicting sensation, and in

the capacity not only to make speech eloquent, but silence more eloquent still. A barrier here and a barrier there—the possession of often damaging strangeness of manner—the seeming absence of a quick sense of humour (which, since that alone would save him from exaggeration, is not quite atoned for by the abundant power of irony and cynicism)—prevent Mr. Irving from showing us the full range of his art; but he shows, at all events, his art's possibilities, and while accomplishing much he suggests more.

FREDERICK WEDMORE.

Two lively little one-act comedies, of the kind so common in France, have been produced at the Gymnase Theatre, by authors whose work does not require extended notice in this place. They are called, respectively, *Le Cadeau du Beau-père*, and *Brûlons Voltaire*!

At the Strand Theatre they will produce on Easter Monday the *Farm-story*, in three acts, by Mr. Robert Reece, which we announced some time ago. A farce by Mr. Martin Becher is also in active preparation; and green-room report speaks highly of both.

It will be seen, on reference to the list of “Appointments” in our Diary, that the Criterion Theatre, Piccadilly, opens to-night. The pieces to be presented are a new comedy by Mr. Byron, called *An American Lady*, and a new extravaganza by Mr. W. S. Gilbert.

THE gentleman who now plays Chastelard in *Mary Queen of Scots*, at the Princess's, is not, as has been reported, a pupil of Mr. Irving's. Mr. Irving has written to a contemporary to say that he “never had, and never shall have, a pupil.”

Ready Money Mortiboy, at the Court Theatre, is pronounced by some judges to be chiefly remarkable for the unusually quiet and carefully modulated acting of Mr. George Rignold therein. The piece itself is said to have suffered in preparation for the theatre from the author's want of familiarity with the more or less mechanical requirements of the stage; but this does not appear to have interfered materially with its acceptance by the audience.

At the Holborn Theatre the French company have succeeded in finding one or two pieces more adapted to their actual capacity than have been some of the pieces which they have presented. *Les Domestiques*, *Les Grandes Demoiselles*, and *Les Voyages de Monsieur Perrichon*, have been acted with success. At Easter the company move to the Princess's; where they will be reinforced by the visits of Mesdames Favart and Pasca, and Monsieur Got, who is, on the whole, to be reckoned as the first comedian of the Théâtre Français. Madame, Chaumont, who, without much voice, has a good deal of character, is also to enliven us after the Easter recess.

AMATEUR theatricals at Pera! One reads in the *Levant Herald* of a performance of Craven's *Milky White*, given in the French theatre, for a charitable object.

MR. J. S. CLARKE, the American comedian, will make his appearance at the Holborn Theatre on Easter Monday.

At the Vaudeville Theatre success is a tradition. In the one hundred and odd consecutive nights of performing the *Road to Ruin* there is, therefore, nothing to note. What we do note, however, is that the piece was withdrawn last night. Mr. Boucicault's early comedy, *London Assurance*, takes its place for a short time, with very much the same cast, we believe, as it had at this theatre a couple of years ago; and on Easter Monday they will produce a new comedy by Mr. Alberty, whose first and greatest success was that which he gained at the Vaudeville, four years since, with *Two Roses*.

A CORRESPONDENT, who says he dined at an unearthly hour so that he might have the advan-

tage of seeing Mr. Charles Reade's little drama, *Rachel the Reaper*, at the Queen's Theatre from seven to eight o'clock, does not appear to have derived unmixed satisfaction from his adventure. He reports, however, that the piece is distinctly successful in arousing the sympathies of the audience for the heroine and her old grandfather—a retired corporal of the Forty-seventh Foot, who, in the years of leisure that have elapsed since Waterloo, appears to have devoted himself with assiduity to the cultivation of his proper language. His speech, says our correspondent, is characterised by unwonted vigour and finish; more than this, it is, when opportunity offers, of undeniable eloquence. On one occasion the eloquence is interrupted by a physical calamity which overtakes him in the “Barton,” as he is surrounded by the peasants on the farm. Hereupon he utters wild words with reference to his early campaigns, and our correspondent was in doubt of his intentions, until a bystander on the stage explained that it was a sun-stroke. Miss Bessie Edwards succeeds in preserving the individuality which Mr. Charles Reade has given to the demonstrative widow; and Miss Rose Evans, though now and then disposed to be conventional in her expression of emotion, is more frequently natural and pathetic in her representation of Rachel. It was noticed, however, that her facial expression was once or twice exaggerated—“a vast theatre,” says our correspondent, “can scarcely be favourable to delicacy of facial play.” Here we should be inclined to agree with him, were it not for the ugly fact that so much of the finest acting ever done in England has been done in old times, in theatres vast as Drury Lane. But he might, perhaps, reasonably rejoin, that the fine acting, in old days, was accomplished in spite of the size of the theatre.

MUSIC.

THE WAGNER SOCIETY.

As mentioned in last week's ACADEMY, the fifth concert of this society took place yesterday week. Though the performance may as a whole be characterised as excellent, it was scarcely equal in finish to the preceding concert—a few trifling slips being observable in the course of the evening. Beethoven's overture to *King Stephen*, the opening piece in the programme, while very pleasing, is by no means one of its author's greatest works. It is, however, comparatively so seldom brought forward, that the opportunity of hearing it from such an excellent orchestra as that under Mr. Dannreuther's direction was welcome. It was followed by Beethoven's “Choral Fantasia” (for piano, chorus, and orchestra), which, with the exception of a passage in which an unfortunate accident happened to one of the wind instruments, was capitally given. The solo part was in the hands of Mr. Walter Bache, one of our most sterling pianists, who deserves to be much more frequently heard in public than he is. That full justice was rendered by him to the composition need hardly be said. The chorus, too, deserve a word of praise for the decision and purity of intonation with which they attacked the high notes which Beethoven, with his usual disregard of the singers' convenience, has introduced so frequently toward the close of the work. Two songs by Miss Antoinette Sterling succeeded—Liszt's “Der du von dem Himmel bist” and Rubinstein's “Waldhexe.” Some of our readers will remember that Miss Sterling sang these same songs at Mr. Coenen's first concert. In our notice of that concert, we remarked that, on a first hearing of Liszt's song, we were quite unable to understand it. This doubtless arose from the fact that the words were not printed in the programme; for in Liszt's songs (as is ably pointed out by Dr. Hüffer in his new book, *The Music of the Future*) the whole effect depends on the combination of music and poetry. As the words were given in the book of the Wagner concert, we were in a position fairly to appreciate it; and it is due to Liszt to say that,

hearing it under these more favourable circumstances, it impressed us greatly from its depth of feeling and truthfulness of expression. Rubinstein's "Waldhexe" is in subject somewhat like Schubert's "Erl-King," to which also in style it bears a certain resemblance. Both were sung most admirably, the second with much dramatic power.

The rest of the concert, according to the plan usually followed by this society, was devoted to Wagner's music. First came the "Huldigungs-marsch," composed as a tribute of homage to the present King of Bavaria, Wagner's great patron, and first performed on his accession to the throne in 1864. It is a piece of pageant-music, of a pompous and stately character, marked by that gorgeousness of orchestration in which its composer excels. Wagner, however, is never heard at his best apart from the stage; and the present march, which might be described as one grand crescendo leading up to a final climax, leaves, with all its beauties, a certain feeling of incompleteness. The next piece in the programme, the opening portion of the second act of *Rienzi*, Wagner's first published opera, had not been previously given at these concerts. It was interesting, not only from its intrinsic musical value, but as showing its composer's starting point. The contrast between the Wagner of 1842 (the date of the production of *Rienzi*), and the Wagner of the present time, can hardly be conceived by those unacquainted with his music. This contrast was brought into the most vivid relief by the juxtaposition with the *Rienzi* excerpt of the prelude to the *Meistersinger*, Wagner's only comic opera, the production of which dates from 1868. This prelude was twice performed at the last season's concerts of this society; and Mr. Dannreuther did well to introduce it again on this occasion. It is an epitome or characterisation of the whole opera. In the carefully prepared programme of the evening it is described as "from beginning to end a thoroughly realistic picture, executed in most robust colours, full of bold antitheses and surprising combinations; a vivid delineation of true old German life, drawn with exuberant fancy and inimitable humour. We see a festive throng moving gaily to and fro, Nürnberg's honest and honourable burghers parading the insignia of the Mastersingers' Guild—a large banner with King David upon it—the popular hero Hans Sachs, whom the people greet with his own glorious songs, at their head. We hear the voice of longing and the sighs of love, almost stifled by the tumultuous multitude. Eva, the Goldsmith's daughter, and the young knight Walther, the poet and singer, seek and find one another, and are quickly parted again by groups of riotous young apprentices. Hans Sachs has heard Walther's passionate love-songs and recognised their value. Helpfully he joins the poet and the maiden, and the festive gathering is transformed into a general rejoicing at their union." The music is thoroughly "Wagnerish," both in its themes and treatment, full of melody, and exceedingly difficult of performance. The rendering was very good; but, unless we are mistaken, Mr. Dannreuther took the whole prelude somewhat quicker than on its previous performance, and the clearness of effect was thereby, in some of the more complex passages, slightly impaired. The choral "Wach' auf," from the same work, had been given at one of the earlier concerts of this season, and was noticed on that occasion in these columns. It need only be said now that it produced quite as much effect on its repetition as on its first performance, and was again encored. A selection of three pieces from the first act of *Lohengrin* concluded the concert. The first of these was the beautiful movement depicting Lohengrin's arrival and farewell to the swan, which had been heard before at these concerts. Next came the quintett and chorus, "Mein Herr und Gott"—the prayer before the combat—one of the finest and most effective pieces of concerted music

that Wagner has ever written, and at the same time one of the most purely beautiful from an abstractly musical point of view. Though not by any means easy, it was excellently performed, and, had it not come so late in the evening, would probably have received an encore. The jubilant finale of the first act, proclaiming Lohengrin's victory in the combat with Telramund, formed a brilliant close to the concert.

But little has been said about the solo singers who took part in the performance, simply because in the selections their share was comparatively unimportant. What they had to do, however, they did well, and it is only due to them to record their names before concluding this notice. In addition to Miss Sterling, already mentioned, there were engaged Madame Elena Corani, Miss Hélène Arnim, and Messrs. Lane, Devon, Ainsworth, and Wharton.

At the next (and last for this season) concert of the society, in addition to a large selection from the works of Wagner, some pieces by Berlioz will be brought forward, two at least of which are almost, if not entirely new in this country. These are the "Duo-Nocturne" from *Béatrice et Benedict*, and the Shepherd's Chorus from *L'Enfance du Christ*.

CONCERTS OF THE WEEK.

As the season advances the number of musical performances increases with such rapidity as to render it impossible to notice in detail any but the more important events. A few passing notes upon each will be all that the limits of our space will allow.

The most important feature of the last Saturday concert at the Crystal Palace was the production of Schubert's Octett. This work was originally written for solo instruments—five strings and three wind. Following the course previously adopted with Beethoven's Septett, Mendelssohn's Octett, and other works, Schubert's piece was on this occasion played by all the strings, the wind parts being in places doubled, to preserve as far as possible the balance of tone. While fully acknowledging the finished performance of the orchestra, especially of the first violins and violoncellos, in the difficult solo passages allotted to them, it is impossible honestly to add that the effect was on the whole satisfactory. A passage designed for a single violin cannot produce the same effect—sometimes not even approximately the same—when played by sixteen instruments in unison; nor will any amount of care on the part of conductor and players preserve intact the balance of power. Thus several passages of imitation in the first movement were lost altogether; the closest attention failed in enabling us to distinguish them clearly. We cannot but think the desire to transform chamber music into a symphony, or quasi-symphony, is an artistic mistake. In such a work as Mendelssohn's Octett the loss is less, because, as it is written for stringed instruments only, it is possible by a judicious reinforcement of each part at least to preserve equilibrium. But with music like Beethoven's Septett, or the present Octett of Schubert, where wind instruments are also employed, a large addition to the string power impairs the effect at once, just because the composer in writing for the wind uses them in an altogether different way from that which he would adopt in an orchestral work. Thus the solo passages for the clarinet and bassoon were in many places all but inaudible. The most effective movements on Saturday were the Scherzo and Finale, which are more orchestral in construction than the earlier parts of the work. Mr. Manns did all that was possible for the music under such conditions; but we confess that we have not the slightest desire to hear it again in this form. The concert began with a magnificent performance of the *Euryanthe* overture, and finished with Bennett's graceful, but seldom played, overture to *Die Waldnymphs*. The vocal music was

contributed by Miss Anna Williams, Miss Sterling, and Mr. W. Castle.

No greater treat has been afforded this season to the frequenters of the Monday Popular Concerts than the truly superb performance last Monday of Beethoven's great Quartett in B flat (Op. 131). In this work, more than in any of its companions, the ordinary form of the quartett is abandoned, there being six movements instead of the customary four. The frequent interruptions of the first Allegro by snatches of the introductory Adagio seem like the ultimate development of the experiment which Beethoven first tried in the early sonata so well known as the "Pathétique." The ethereal Scherzo which succeeds is, like that of the quartett in C sharp minor, in common time. The third movement, *andante con moto*, is one of the most striking examples of polyphonic writing—unity in diversity—to be found in the composer's works. Thus far the work has, though with some important variations of detail, followed the usual form of chamber music; but here, before the *Finale*, are introduced two movements—musical *hors d'œuvres*, so to speak—two of the loveliest parts of the entire quartett. These are the *Alla Tedesca*, a quaint movement in waltz time, and the exquisitely moving Cavatina, one of the most tender and pathetic movements which Beethoven ever wrote. This veritable "song without words" for the first violin is unique. No similar movement, so far as we know, exists, though a distant echo of its strains seems occasionally to linger in some of Schumann's adagios. The masterly *Finale* is one of the longest and most richly developed of its author's quartett movements. To speak in too high terms of last Monday's performance of this most difficult work would be impossible. Herr Joachim was simply inimitable, and was most ably supported by Messrs. Ries, Straus, and Piatti. The enthusiasm with which the quartett was received was unbounded; the Scherzo was redemanded, and repeated; and a strong disposition was manifested to encore some of the other movements. We cannot but think it a mistake under any circumstances to accept an encore for a movement of a classical work. However flattering the compliment to the players, the artistic balance of the music is destroyed. Herr Joachim also produced, for the first time, a Sonata for violin, by Tartini, which afforded good opportunity for the display of his wonderful skill in "double-stopping," but is of no special musical interest. The pianist was Mr. Dannreuther, who, to our regret, was only heard once. He played Beethoven's Sonata in A flat (Op. 110), with a perfection of mechanism, a purity of style, and a warmth of expression never passing into exaggeration, which cannot be too warmly commended. We have never heard Mr. Dannreuther to greater advantage. Miss Edith Wynne gave a most artistic rendering of Schubert's "Young Nun" and Gounod's "Quando a te lieta" (violin-cello obbligato, Signor Piatti). Haydn's popular quartett in D (Op. 64, No. 1), concluded the concert.

MR. W. COENEN, on Wednesday night, brought his series of "Concerts of Modern Music" to a successful close. The third concert was fully worthy of its predecessors. The opening piece was a string quartett (Op. 25), by F. Gernsheim, one of the younger German composers, with whom an English audience had on this occasion a first opportunity of becoming acquainted. If the quartett in question is a fair average specimen of Herr Gernsheim's music, a hearing of other works from the same pen would be welcome. It is written with admirable skill, and a perfect clearness of form which renders it thoroughly intelligible at a first hearing; and there is about the subjects a melodic freshness and grace which well sustain the interest of the audience. The opening Allegro, in C minor, though good sound music, is less attractive—such, at least, is our first impression—than the movements that follow;

but the Andante con moto, founded on a charming theme, developed with much taste, and full of ingenious combinations, is really admirable, in spite of a slight tendency to undue length. Even better is the third movement, a Scherzo of a somewhat extended form, the subjects of which at once arrest attention by their marked rhythm. This Scherzo is not only thoroughly good in itself, but has the additional merit of being entirely original, so far as our memory serves us; for the curious resemblance between the theme of the *trio* and a well-known passage for the violins in Handel's "Hailstone" chorus is evidently a coincidence rather than a reminiscence. We are inclined to consider this movement on the whole the finest part of the work. The Finale, a "Rondo all' ungarese," constructed on a piquant three-bar rhythm—this rhythm being one of the peculiarities of Hungarian music—is in its character very similar to the Finale of Brahms's piano quartett in G minor, which is also "all' ungarese." There is no plagiarism; but the resemblance produced by the employment of the same unusual rhythm is too obvious to escape notice. This movement forms a worthy and brilliant conclusion to the work, which was throughout admirably played by Messrs. Wiener, Amor, Zerbini and Daubert. Bargiel's sonata in F minor (Op. 10), for piano and violin, also well performed by Messrs. Coenen and Wiener, failed to impress us so favourably. Admirably constructed from a technical point of view, and showing the skilled hand of a thoroughly trained musician, it presents but little novelty in its ideas, which, moreover, with the exception of one or two themes, such as the second subject of the first movement, and the opening of the Andante, are wanting in charm. The concluding instrumental work brought forward at this concert was Rubinstein's quintett in F, for piano and wind instruments, which, by a most ludicrous misprint, was advertised in one of the daily papers, as "for piano and winged instruments." Like most of its composer's larger productions, this is a most unequal work. That Rubinstein possesses considerable originality, and that many of his themes are of great beauty, cannot be disputed; but side by side with most enjoyable passages are to be found pages of the most uninteresting "padding." The result is a want of unity about the whole, and an entire absence of that feeling of satisfaction which a classical work ought to produce on the hearer. In the present work this was especially noticeable in the first and last movements, the impression produced being vague; on the other hand, the slow movement, excepting some of the developments, is very interesting, and the Scherzo is charming throughout. In the hands of such artists as Messrs. Coenen (piano), Svendsen (flute), Lazarus (clarinet), Wendland (horn), and Wotton (bassoon), it need hardly be said that full justice was rendered to the music. The vocalists were Miss Ferrari and Mdle. Hélène Arnim, the former being especially successful in Spohr's charming song, "The Bird and the Maiden" (clarinet obbligato, Mr. Lazarus); while Mdle. Arnim deserves special mention for introducing two of Wagner's songs with piano, "Tannenbaum" and "Attente," both interesting, though not readily "to be understood of the people." The thanks of all musicians are heartily due to Mr. Coenen for affording such opportunities as he has given for becoming acquainted with so much that is new and interesting; and, though the concerts have not been so well attended as might have been wished, we hope he will be encouraged to give another series next season.

Ebenezer Prout.

THE Middle-Rhenish Musical Festival, which has been interrupted for a considerable time, is to take place at Mainz, on July 8, 9, and 10. Among the works to be performed are Mendelssohn's *St. Paul*, the overture to *Euryanthe*, and Beethoven's Choral Symphony.

MR. MAPLESON's operatic season at Drury Lane Theatre commenced on Tuesday last, when the opera selected for performance was Rossini's *Semiramide*, with a very strong cast, including Mdle. Titiens, Madame Trebelli-Bettini, and Signori Agnesi, Rinaldini, Campobello, and Casaboni.

MADAME ADELINA PATTI is engaged by the impresario, M. Strakosch, for a tour through the United States and Canada, to begin in September. She is to sing on a hundred evenings, and to receive 10,000 francs (400*l.*) for each performance.

At M. Gounod's fourth concert, which takes place at St. James's Hall this evening, his new setting of the "Ave verum" will be performed for the first time.

THE specialty of the first Philharmonic Concert, next Wednesday, will be the revival of Handel's Grand Concerto (No. 11) in A, for stringed instruments—one of the finest of the series of twelve. The work, though it used to be frequently given at the long since defunct "Ancient Concerts," has probably hardly been played in public within the memory of any one living.

It is said that M. Gounod has promised to write a new three-act opera for next winter's season of the Opéra Comique at Paris. He has chosen for his subject Molière's comedy, *Georges Dandin*, and will write his own libretto.

THE firm of G. Heinze, in Leipzig, have just issued a medallion-portrait in plaster of Paris, of Frédéric Chopin, which is the work of Valentin König, the sculptor of Dresden.

AFTER a lapse of sixteen years, Weber's *Euryanthe* has been revived with success, at Cassel.

HANDEL's *Saul* has been produced at Königsberg, with the original orchestration, the organ part being played on a large harmonium.

THE town of Zittau is about to erect a monument in honour of its native composer Heinrich Marschner.

A LAWSUIT interesting to operatic singers has just been decided at Berlin. Fräulein von Ferenczy was engaged as "prima donna" at the opera; and the director, Bente, offered her the part of "First Lady" in the *Zauberflöte*. She declined to sing it, saying that the only parts suitable for a prima donna in that opera were those of Pamina and the Queen of Night. In consequence of her refusal, she was dismissed, and brought an action against the director to recover three months' salary. The court unanimously decided in favour of the plaintiff, as the part of "First Lady" was notoriously a secondary part. Against this decision the defendant appealed, on the ground that it was an art-question, which could only be decided by competent musical judges. The court of appeal thereupon called to their assistance three eminent musicians, Messrs. Taubert, Wuerst, and Michaelis; who all agreed that the part in question was a secondary part. The decision of the lower court was therefore confirmed.

POSTSCRIPT.

THE *Levant Herald* states that M. Lifonti, a well-known local artist of Constantinople and manufacturer of stringed instruments, has just perfected a most ingenious piece of mechanism, which, applied internally to pianos, greatly assists the beginner and early student in the practice of that instrument. Several of the best pianists of the city have tried the new invention, and warmly approve its artistic simplicity and ingenuity and its practical utility. It in no way alters the tone of the piano, but the practiser who uses an instrument to which it is applied acquires speedily a force and gradation of touch and facility of execution which it takes long and laborious pains to master under the old system.

THE Council of the Zoological Society of London have determined to appropriate the interest of the Davis Fund of 1874 to the establishment of a series of lectures upon zoological subjects, to be given in the Picture Gallery in the Society's Gardens in the Regent's Park, on Tuesdays and Fridays, at 5 P.M., between Easter and Whitsuntide. The following gentlemen have consented to give the lectures:—Introductory Lecture on the Animals in the Gardens, by P. L. Sclater, M.A., Ph.D., F.R.S., Secretary to the Society, on April 14; On the Geographical Distribution of Mammals, also by Mr. Sclater, on April 17, 21, 24, and 28; On the General Classification of Vertebrates, by A. H. Garrod, B.A., Fellow of St. John's College, Cambridge, Professor to the Society, on May 1, 5, 8, 12, and 15; On the Aquarium and its Inhabitants, by W. B. Carpenter, M.D., F.R.S., on May 19 and 22. These lectures will be free to Fellows of the Society and their friends, and to other visitors to the Gardens.

WE understand that the concluding volume of Mr. Spedding's *Letters and Life of Francis Bacon*, which will be published in April, will include a letter from Mr. Heath, the editor of Bacon's *Professional Works*, on the subject of the case of Dr. Steward, one of those in which there has been a suspicion that Bacon was influenced as a judge by letters received from Buckingham. Mr. Heath takes a less favourable view of Bacon's conduct than Mr. Spedding had been inclined to take in his last volume.

IN October or November Messrs. Macmillan will publish Lady Herbert of Len's translation of Baron Hübnér's *Voyage autour du Monde*, under the title of *Rambles round the World*.

WE regret to announce the death of the celebrated German astronomer Mädler, so well known for the Map of the Moon, of which he was the joint author with M. Beer. He died at Hanover, on the 14th of this month, in the eightieth year of his age, after a long life of incessant activity and ardent devotion to his favourite science.

MESSRS. SAMPSON LOW, MARSTON & Co. have in the press, *The China Collector's Pocket Companion*, by Mrs. Bury Palliser. It is meant to supply the want of a portable guide to marks and monograms, and as such will prove very useful to the lovers of the ceramic art.

SATURDAY, MARCH 28, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER and not to the EDITOR.

LITERATURE.

Life and Letters of Sir Gilbert Elliot, first Earl of Minto, from 1751 to 1806. Edited by his Great-niece the Countess of Minto. Three Volumes. (London: Longmans.)

WE have lately had occasion to review a political biography embracing the interval between 1806 and 1812. We have now before us another which includes the period between 1780 and 1806. It is a period rich in subjects of interest for both historians, statesmen, and literary students of Parliamentary history. It opens with the end of the American war, and closes with the death of Mr. Pitt; and comprehends between the two extremes the famous struggle of Mr. Pitt against the Whig coalition; the equally famous trial of Warren Hastings; the French Revolution; the memorable Whig and Tory fusion, the most conspicuous instance of party patriotism in our annals; the union with Ireland; the great naval victories of Rodney, Howe, Duncan, Jervis, and Nelson; the Indian campaigns of Wellington; and the disappearance from the stage of the two great men whose names are still symbolic of all that is grand and ennobling in Parliamentary warfare.

The hero of the present volumes is the first Lord Minto, and the task of introducing him to posterity has been undertaken by his great-niece, the present Countess. She has discharged her task with more than ordinary ability; and has interspersed the more solid portions of her work with such numerous anecdotes, and amusing gossip, illustrating the manners of the period and the leading actors on the public stage, that we may safely pronounce it one of the best books of the class to which it belongs. The Elliots are, of course, a well-known clan of Scotch Borderers, and it is unnecessary to tell the world anything about them. Sir Gilbert Elliot, of Minto in Roxburghshire, the third baronet of the name, was one of that little band of Scotch Tories who made themselves so useful to George III. in his earlier attempts to shake off the "Revolution families." He joined the banner of Lord Bute, became a "King's friend," and a prime agent in carrying on that curious system of mining and countermining to which the King was driven almost in self-defence by the implacable ambition of the leading Whig connexions. Now we find Sir Gilbert instructed to be "rude to the Duke of Newcastle," now directed to vote against his Majesty's ministers; and always a prominent figure in the various consultations, combinations, and co-operations which seem to have been necessary to the due transaction of "the King's business." He died in 1777, and was succeeded in the family estates, and also in his seat for the county, by his son, the subject of these memoirs, who first entered public life on

the same principles as his father. Towards the close of the American War, however, converted, as he says, by the arguments of Fox and Burke, he went over to the Opposition, and, had Fox's India Bill been carried, would have been rewarded with a seat in the direction. Instead of this he became one of Fox's martyrs, losing his seat, in common with sixty other Coalitionists, on Pitt's appeal to the country in 1784. Sir Gilbert Elliot was not more prophetic than his friends. He, too, likened Pitt at first to a schoolboy playing at being minister, and spoke contemptuously of the time when he must be sent back to school, and the serious work of government recommenced. His astonishment on finding that it was himself and his friends who had to go to school again, and that the boy minister had beaten all the veterans opposed to him, may easily be imagined, but is judiciously veiled by Lady Minto. Some of his subsequent letters are interesting from the illustrations which they give of that propensity in all beaten parties not to look facts in the face, or to acknowledge the reality of the change, so many curious symptoms of which are visible at the present moment. We find Sir Gilbert mentioning, in a letter to his wife, in 1787, that there are already rumours in the party of Pitt's resignation, and of a new Government being formed under Lord Lansdowne and Lord Grenville, there being no more design of such a change than there was of proclaiming Charles III. But anything to cast a slight upon the "boys," who, says Burke, "have now got to the head of affairs, and bear themselves with all the sour and severe insolence of sixty." This was said in a letter to Sir Gilbert Elliot, who had now been returned for Berwick, and took his seat in the House of Commons just in time to bear a part in the impeachment of Warren Hastings.

The part allotted to him was the impeachment of Sir Elijah Impey, Hastings's well-known confederate in some of his most dubious transactions. And if the speech which he made on this occasion deserved all the compliments which such men as Burke, Fox, and Windham are reported to have paid to it, our only wonder is that Elliot did not at once step into their shoes and become the leader of the Whigs himself. Fox said "there was never anything so entirely perfect." Windham, that it was "the grandest display of character and talents ever heard within the walls of Parliament." Burke said, p. 184:—

"What I have never before seen, never I am sure in an equal degree—the method, the arguments, the sentiments, the language, the manner, the action, the tone and modulation of voice, were all exactly of a piece, belonging each to the other, so that they were all peculiarly his own, and not copied from any original we have seen in our own time in the whole or in any part. . . . There was not a topic upon which he touched that had not its peculiar beauty, and the finishing hand of a master."

Sir Gilbert's own account of the matter was not, if these eulogies were justified, exaggerated; but it shows, perhaps, that Burke's advice to him a year before, to get rid of his modesty, had not been entirely

neglected. On February 13, 1788, the trial of Hastings was commenced. He never appears, however, to have spoken in Westminster Hall. But on April 28 he had to state his case against Impey in the House of Commons, when his eloquence again seems to have been the theme of every tongue. Before the end of the year, however, he retired from the case, and his next appearance in public was as candidate for the Speaker's chair, vacant by the death of Mr. Cornwall. The ministerial candidate was William, afterwards Lord, Grenville, who beat him by a majority of seventy-one. But, undeterred by failure, he stood again, in the following June, against Addington, when Grenville's appointment to the Home Office created another vacancy, but was again defeated by a majority of forty-one. Both these contests took place in the same year, 1789, when the hopes which had been suddenly kindled in the Whig party by the King's illness were extinguished again by his recovery. Elliot, one of those men who made politics a profession, was naturally disappointed, and, in a letter to his wife, dated April 2, expresses himself with creditable candour on the subject, confessing that he finds it difficult to feel as pleased as he ought to be at an event which had dashed the cup from his lips. However, there was nothing for it but to put as good a face on the matter as possible, and wait for the next opportunity. This arrived in due course. As he had ruined his chances in 1782 by going over from Pitt to Fox, he was to retrieve them in 1792 by going over from Fox to Pitt. The French Revolution was a godsend to many minor Whigs, as it gave them an excuse for coming over to the winning side, and obtaining their share of those emoluments of which they had been so wickedly deprived. Yet the approaches were at first very gradual. The Whigs affected great coyness; and so late as May 1792, Sir Gilbert Elliot says he is sure that no one part of them will think of joining Pitt without the other. Already Ministers had begun to hint at such a fusion. But when Parliament broke up in June, and Sir Gilbert set out for Scotland, he was still convinced of its impossibility. During the whole of the recess he continued to receive long letters on the subject. Pitt had at length made definite overtures to the Duke of Portland. But at that time it was thought that no new arrangement could be made from which Fox was to be excluded. And the negotiations for a fusion lingered on through the whole of the following year, and into the middle of the next, before the other Whig leaders could make up their minds to come without him. At last, however, they did; and, in July 1794, the Duke of Portland became Home Secretary; Mr. Windham, Secretary at War; Lord Fitzwilliam, President of the Council; and Lord Spencer, Lord Privy Seal. Sir Gilbert Elliot, however, had not thought it necessary to wait quite so long. Earlier in the year he accepted from Government the post of English Commissioner at Toulon; and for some years afterwards his correspondence is dated from abroad, where he continued to be employed in various situations of considerable dignity and importance.

In 1794 he was appointed Provisional Governor of Corsica, for the purpose of superintending its annexation to the British Crown. He was then joined by Lady Elliot and his children, and a more interesting account of that very interesting island than is to be found in these pages we have never met with. Sir Gilbert was struck with its resemblance to the "Border," and some years afterwards showed to a Corsican gentleman Scott's *Border Minstrelsy*, as presenting a perfect picture of his native island, which the Corsican readily acknowledged. The population of the island was divided into clans, composed of a few chief landholders and their following. Hereditary feuds were universal. Like the Borderer, the Corsican peasant was content to live on simple fare. Ewe-milk cheese and cake made of chestnuts, were his ordinary diet; but, like the Borderer, he felt himself nobody without his horse and his gun. Like the Borderer, he preferred the care of flocks and herds to the labour of tillage; and, true to him in all things, loved a fray better than either. Lady Elliot's letters to her friends are full of charming little pictures of the life, society and scenery of Corsica; of her balls in the open air, where her guests danced by moonlight on a terrace overhanging the sea, surrounded by hedges of rose, orange, and myrtle; her rambles over the mountains under the thick shade of overarching evergreens; the peasants with their dirks and pistols; the women with their gold-laced petticoats and scarlet head-dresses; the pretty highland villages, so like English ones, with their hay fields and corn fields and oak trees; with sketches intermixed of Paoli, and Moore and Nelson, and Jervis, and other great men with whom she was in constant intercourse. Her husband, unfortunately, did not get on very well with either Paoli or Colonel Moore, the commander of the English troops. It is easy to understand that Paoli conceived he had a right to be the first man in the island, and would feel mortified at seeing any other native admitted to a greater share of the governor's confidence than himself. Sir Gilbert Elliot, however, said that Pozzi di Borgo was the only Corsican whom he found capable of taking general views, and he continued to rely on his advice. Moore, on the other hand, seems to have sympathised with Paoli; and the upshot was that Paoli was invited, and Moore recalled, to England. Doubts have been thrown on Sir Gilbert Elliot's judgment in this particular case; and, at all events, his government did not succeed in the object with which it originated. After a partial insurrection had been quelled, we finally gave up the attempt—the attempt to hold Corsica as a British possession—and abandoned it once more to the French, who reoccupied the island amid popular rejoicings in 1796. After leaving Corsica, Sir Gilbert spent some time at Naples, and returned home in the following year, having had the good luck to witness the battle of St. Vincent on his homeward voyage. For his services in the Mediterranean Sir Gilbert was created Baron Minto of Minto, and for a time resumed the political occupations which his mission to Toulon had interrupted. He, or

rather Lady Minto for him, takes an unfavourable view of the working of the Amalgamated Government which he found established on his return, and seems to agree with Lord Macaulay that Pitt should either have conducted the French war on the principles of Burke and Windham, or else have done nothing at all. Lady Minto, perhaps, has not read Lord Stanhope's vindication of Pitt; and it is necessary, therefore, to observe that no final estimate of Pitt's policy can be established without it. In June 1799, Lord Minto was despatched as Minister Plenipotentiary to Vienna, where he remained till November 1801. He had been sent out to arrange an offensive and defensive alliance with Austria, which was happily concluded, and remained in force till after the battles of Marengo and Hohenlinden forced the Emperor to violate his engagements, and conclude a separate treaty with the enemy. This event seemed to Lord Minto the natural conclusion of his own mission, and the news which shortly reached him of the resignation of Mr. Pitt confirmed his resolution. He returned to England in the middle of the debates in both Houses on the Peace of Amiens, and immediately attached himself to his old friends, who united in condemning it. The unsatisfactory nature of the Peace, the open disregard of its articles by the French government which immediately followed, the menacing language of Napoleon, and the defenceless condition of England, all combined to raise feelings of mortification and alarm which were eventually fatal to the Ministry. The recall of Mr. Pitt became a great national necessity. Some attempts were made at a junction on equal terms between himself and Addington, to which Lord Minto says "he listened." But we fancy he did nothing of the kind. Dundas, who was the bearer of the message, arrived at Walmer Castle, where Pitt lived very much in seclusion, in the afternoon, but did not venture to unfold his mission till after dinner, when the second bottle of port was in progress. Pitt saw what was coming before he had uttered three sentences, and Dundas, perceiving from his looks that the case was hopeless, at once dropped the subject. Subsequent attempts were equally unsuccessful, and finally Addington was obliged to resign and leave Pitt in possession of the field. But then his difficulties began. The King would not have Mr. Fox in the new administration, Lord Grenville would not join it without him, and the old Whig seceders of 1794—Windham, Lord Minto and others—of course took the same ground. They may have been right; but however that may be, we are sure Lord Grenville was wrong. Public opinion was very strong against him at the time, and the reasons he assigned himself will not hold water for a moment. We have here a long letter from Lord Minto to his son, in which he justifies his own conduct in common with that of his associates. But Lord Minto, Mr. Windham, Lord Spencer and others, had belonged to the Whig party, had been led by Mr. Fox for twelve years, and might well consider that the schism of 1794 was now healed, and that they and the Foxites were all one party again. But this was not the case with Lord Grenville; he had always been a Tory. His allegiance was

due, not to Mr. Fox, but Mr. Pitt. And to say that because Fox had co-operated with him in the overthrow of Addington, therefore he was precluded from taking office without him, is so opposed to both the theory and practice of Parliamentary parties, that it is plain it was a mere pretext. Mr. Fox and Lord Grenville had been opposed to each other all their lives, and an accidental concurrence of opinion on a particular question could create no such obligations as Lord Grenville professed himself to feel. Pitt's indignation was excessive. "I will teach that proud man I can do without him," he exclaimed, "if it cost me my life." And when, some time afterwards, Grenville sent him a copy of Lord Chatham's *Letters*, which he had edited and just published, with a note beginning "My dear Pitt," and ending "Yours affectionately," Pitt returned him no answer. We are glad to see that Lady Minto herself does justice to Mr. Pitt in a few well-turned sentences which express the opinion of posterity unbiassed by contemporary prejudice. His death brought to Lord Minto a splendid reward for his long political services. Fox, who retained a lively sense of his activity in '94, objected to meeting him in the Cabinet; so he was appointed Governor-General of India.

At this point Lady Minto's narrative terminates; and it only remains for us to point out the great social interest with which her volumes are replete. As a record of contemporary manners the innumerable biographies and memoirs which relate to the same period may be ransacked for an equal. The *Memoirs of Lord Auckland* are the nearest approach to it, and the lively letters of one of Lord North's daughters are the nearest approach to those of Lady Elliot. There is a great deal in the three volumes about the convivial habits of the period. March 19, 1790, Sir Gilbert left Fox and Grey "just beginning to talk thick." At another time he sits till past eleven with Grey and a few other choice spirits, and finds that he escapes best by drinking port, because, as all the others were drinking claret, he was not required to pass the bottle, and could therefore drink as little as he chose:—

"Fox drinks what I should call a great deal, Sheridan excessively, and Grey more than any of them; . . . but it is always accompanied with clever lively conversation on subjects of importance. Pitt, I am told, drinks as much as anybody, generally more than any of his companions, and that he is a pleasant convivial man at table,"

with much more to the same effect. Then we have accounts of Pitt in what Mr. Pleydell would have called his "altitudes," playing at blind man's buff, and the gayest of the gay. Also innumerable anecdotes of the boyhood of the late Lord Palmerston, who seems at that early age to have been regarded as preternaturally solemn. His latent tendency, however, broke out one day, when, at a party at Dugald Stewart's, he sprained his ankle in jumping over Miss Stewart's sofa. But we must not linger over these interesting anecdotes, with which we might fill a whole number. Our last observation must be an expression

of surprise that Lady Minto has neither quoted nor alluded to the character of Lord Minto, drawn by Sir Walter Scott, to be found in the sixth volume of Lockhart's *Life*. Sir Walter, who was opposed to him in politics, says "he was a man among a thousand," and he mentions, moreover, a very curious superstition among the tenantry of the Minto estate, who believed that he was not dead, but was hiding himself in Minto House on account of something wrong he had done in India, and that he used to walk about the woods at night "with a nightcap on his head, and a long white beard." T. E. KEBBEL.

Fables in Song. Lord Lytton. (Edinburgh and London: Blackwood & Sons.)

AT last the distinguished poet who has tantalised us under so many names with work which was so undeniably attractive and yet so unsatisfactory—work that showed an unmistakable faculty of growing, but not the faculty of standing alone or lasting—has given us something that really ought to last. It is not that he has shown higher or wider gifts now than he showed in his earlier work: on the contrary, it would be easy to select pages from his earlier works which come nearer to be charming or powerful than what is strongest or sweetest in *Fables in Song*; even the quaintness and ingenuity of his last work is anticipated in much of *Chronicles and Characters* and *Lucille*. Only in his earlier books the gifts of the writer never seemed to have come together; a sympathetic reader merely felt that he was kept in an ideal excitement by a profusion of sentiment and imagery which passed and left no definite and rational impression behind. The writer's gifts have come together now in a way to leave a very definite and subtle impression indeed, though it may still be said that the greater part of the *Fables in Song* make more demands upon the reader than is precisely desirable; they are not difficult in the way in which so much of Mr. Browning is difficult, but it is possible to read many of them and recognise nothing but a diffuse and vapid, and yet unquestionable ingenuity. The fact is that the author's way of thinking is peculiar; he is curious and interested about a great many things in which the interest of the majority of readers is at most mediocre. Again, there are many things which most readers think they ought to feel strongly and be anxious about, which the writer hardly seems to care for at all. Or, to put the same thing in another form: most readers come to poetry with a theory of the world ready formed in their minds, which they expect the poet to help them to make clear and articulate, because they expect the poet to have a theory too, which will serve at some point or other to light up theirs. Though, of course, the intelligent reader allows for the fact that it is the business of a poet to put his theory in a concrete rather than an abstract form, it might conceivably be a trial to many readers who think themselves intelligent, that Lord Lytton seems to have no theory of the universe at all, and to have no other purpose for his fabulous machinery except

to make his heterogeneous impressions of it as articulate and as impersonal as possible.

Of course, to be impersonal is part of the *raison d'être* of all fables; it is the business of a fabulist to find a situation the logic of which shall express a moral lesson liable to be overlooked through the force of personal prepossession in the familiar circumstances under which it is applicable. The old school of fabulists generally used this machinery for the purpose of turning truisms into epigrams, and took it partly from the old beast-epic and partly from the equally old stock of humorous stories. Lord Lytton deviates from precedent in both directions. His morals are hardly ever obvious, and even when they are not exactly recondite, they have a certain remoteness, at least a certain strangeness, like a bit of high road near home that we come out upon after a day across country. Nothing can be less like the naive anthropomorphism of other fabulists than the series of subtle analogies between the life of nature and the life of man, which seem to indicate that Lord Lytton has read Schopenhauer for other purposes than quotation. When we judge of our own success or failure, we are liable to complicate the issue by bringing in a number of indispensable conceptions about virtue and vice, and rights and duties; but when we have mastered the notion that in nature there are analogies to desire and effort, prosperity and defeat, it becomes intelligible that thinking fancifully about nature may be a help to think simply and naturally about ourselves—and perhaps to judge more reasonably of nature than is possible while we try to keep up the unscriptional fiction that there is no discord in creation, except what proceeds from conscious sin.

But though the author is not an optimist, he is not a pessimist, and does not intend to complain. In the Introduction to the first volume (each volume has one of its own), he meets the Fox of Fable, who informs him—

"That Aesop is living to-day,
'Where, prithee?'"

"In me, in thee;
For he lives in each living creature
(Man, beast, bird, blossom, and tree).
And his life is the love of nature.
The complaint, that was half a caress,
Men have turn'd into bitterness:
The counsel, cordial and bland,
To a churlish reprimand;
Justice, robed in her ruth,
To Resentment eager to smite;
And Sagacity, Hamour, and Truth,
Into Sarcasm, Satire, and Spite.
Thus, alas! when, to banish the true,
A false Aesop you form'd, of your own,
We, the children of Aesop, withdrew."

Perhaps the prettiest example of the author's kindness is one of the longest of the fables, *Fiat Justitia*, which details the misfortunes of Simplicius, who has an ingenious plan for getting the good qualities of human nature, separate and unalloyed, in representative animals: grace in the cat, charm in the bird, fidelity in the dog, grim savage humour in the bear. He has to leave home, and the cat eats the bird, and the dog eats the cat, the bear eats the dog, and tears the butler's head when he endeavours to rescue the dog; the gamekeeper shoots the bear, and sells

the venison, and Simplicius eats it in ignorance; and when he hears the story, which is told in an admirable vein of humorous pathos, he draws the moral, *Fiat justitia, pereat homo*; because, as we should have explained before, his system was intended to refute the tragical maxim, *Fiat justitia, pereat mundus*, by showing, that if you isolated the elements which give the world its value, it was possible to do justice to all without destroying any. Another more strictly poetical example of the same kind of charm is to be found in the pair of fables, called *The Blue Mountains*, or *the Far*; and *The Wheat Stalk*, or *the Near*. The latter is simply a graceful string of reflections upon the fact that a wheat-stalk may be held near enough to the eye to hide twenty leagues of country, and that often a man's home, by the same law of mental perspective, sometimes beneficent and sometimes tragical, looks larger to him than the rest of the world. The former is so interesting as to carry the reader through both: the hero is a tranquil *employé* in a small German town, whose spiritual nourishment has been to watch the changes of the Blue Hills on the horizon; at last, to his great happiness, he is banished into the heart of the district where they lie, and is surprised to find, on waking up the morning after his arrival, that the country is not in the least blue; he mounts the nearest of the green hills, and sees the blue hills far away in the distance, and is told that they are in the country where he has lived all his life. Of course, the moral is that the Blue is a type of the Ideal. It is worked out at too great length for quotation; indeed, an unsympathetic reader might complain that ten pages were rather much to spend on the familiar thesis that "distance lends enchantment to the view;" but the lengthiness is not really tedious, for the author does not start with a thought to be beaten out as thin as possible; he is feeling his way to a thought not yet appropriated. Besides, he can be curt and pungent when he pleases, as in the following fable of *The Ass and the Wagtail*. The Ass thinks the sun overrated, and complains to the Wagtail, who encourages him by nodding:—

"Look at me, little bird! I am far
From comparing my humble powers
With those of that profligate star.
But to perfect them, all the twelve hours
I've a practical occupation:
Without it, I care not a whit
For brilliant imagination.
And I value not genius or wit,
If it lacks the elaboration,
The earnest moral tone
And genuine consecration
Of work—work steadily done.

The thistle, that hardy relation
Of the sickly artichoke,
I have learn'd to know and esteem,
And relish my well-earn'd ration,
Not envying sumptuous folk,
Then, is it not hard, I ask,
When my voice I raise
In vigorous lays of praise
To celebrate Virtue's task,"

that everybody runs away. At last the Ass gets the following complete explanation of the Wagtail's apparent assent to his grievances, and of the whole situation:—

"If I nodded, 'twas because 'tis my way,
And because I am a wagtail, I.
So the sun shines, yonder, upon high
Just because he is the sun,
And so you, too, as you say,
Fetch and carry sacks all day,
Getting thanks for it none,
Just because you are an ass."

In the Conservation of Force the moral is more positive, and is flashed upon us more rapidly. A musician sees a picture, which sets him improvising when he gets back to his piano; a poet listens to the improvisation, and goes home to write the poem which it inspired. The poem in turn inspires another picture, and the two pictures become the starting points of rival schools of art. Another admirable fable is "a legend" devoted to an expansion of an aphorism of Schopenhauer's, that Ability has its reward in this world, Virtue in the next, Genius in neither, being its own reward.

Of the fables of Nature, the best are The Rain Pool, containing the sorrows of some drops of rain which, instead of finding their way underground to the distinction of a mineral spring, get entangled by the roots of the oak, where their pure souls are vexed by the filthy conversation of a rotten acorn, proud of the grub inside her, till they are consoled in autumn by a sight of the stars through the bare branches, and purified by the winter's frost; and Sic Itur, the Story of a Birch Tree which desired to sail through the sky as a cloud, and had its aspiration realised in a sense by being cut down for fuel. Such a subject certainly makes us feel the appropriateness of the author's method, which proceeds rather by reverie than by epigram. In the metaphysical poems, which are numerous and ingenious, this appropriateness is less obvious, though it is probably a sufficient reply to captious criticism that the best epigrams have always been written on familiar, not to say hackneyed subjects.

The moral of "Teleology" is hardly original, but it has not often been put so quaintly and so scornfully; and "A Philosopher" and "Cogito ergo Sum" come as near being new as we can expect in the nineteenth century. The "Philosopher" is a Windmill, whom the birds who pick up the grain that falls from the hopper regard as a demigod-demibird, banished to earth for his love for the Watermill: he himself regards his grinding corn as a mere subordinate incident of his true function, which is to raise the wind—which drives him. "Cogito ergo Sum" is the history of a (false) Balance, who vainly imagined that his oscillations before the final equilibrium were attained was a proof that he attained it freely; and that when he had weighed a thing he understood it.

As is natural, the author is much occupied with literary problems: in "Ancients and Moderns," a snake which thinks to crush an antique statue by more effective coils than its brethren in the Laocoon is taken for a type of the writers who strain themselves vainly to subdue the majesty of ancient subjects to the slimy contortions of modern passion. Pyrrhonism, or the Haunted Hen is a legend of a fowl who ceases to lay because she dreams that she is a weasel, and compelled to suck her own eggs, just as authors who are also critics become barren.

The Eagle and his Companions is an allegory of the unsuccessful attempts of the pedant and the sentimentalist, represented by the Mole and the Butterfly, to maintain themselves on the level of Genius: the Mole is very amusing indeed, and the whole fable would be in the highest degree admirable if the writer could have put some really superb poetry into the mouth of the representative of Genius. But Genius does not speculate about itself; it leaves such theories to generous and aspiring Talent. The author recurs to the subject repeatedly, especially in connexion with the drawbacks of eminence, in such fables as The Rock, and The Mountain and the Marsh, though in these there is perhaps a political meaning. In other fables the political teaching is more explicit. The author treats conservatism of the drag-on-the-wheel description with unreserved contempt; and in such fables as Homo Homini Lupus and The Horse and the Fly, he admits that on moral grounds it is easier "to make laws than to justify them;" but in spite of this he is an unmistakable aristocrat, and sets forth in Demos and The Plane and the Penknife the inherent superiority of marble over clay, and iron over wood, as examples of the way in which the few ought to impose their ascendancy on the many.

We have passed over many fables, some of which, like "Et Cetera," are very profound; though others, like "Ducunt volentem Fatanolentem trahunt," are forced in construction and exposition, all should be carefully studied by readers who desire to appreciate the savour of a new literary product.

G. A. SIMCOX.

The Heart of Africa: Three Years' Travels and Adventures in the Unexplored Regions of Central Africa, from 1868 to 1871. By Dr. Georg Schweinfurth. Translated by Ellen E. Frewer. With an Introduction by Winwood Reade. In Two Volumes. With Maps and Woodcut Illustrations. (London: Sampson Low & Co., 1873.)

(Second Notice.)

DR. SCHWEINFURTH is a scientific botanist of the highest reputation, and his descriptions of the flora of the Heart of Africa are amongst the most valuable results of his travels; and they are also the most attractive for general readers, for Dr. Schweinfurth is a completely cultivated savant, whose eye is not only the servitor of accurate observation, but "minister of all life's beauty." It is rarely indeed that so remarkable and cultivated a sensibility as his to the poetry of nature is found amongst scientific men. Too often it would seem as if nothing existed for them, or was true at all, which they cannot touch and weigh and label. But nothing can be more false and unfruitful than such a blind mechanical philosophy, which would bind by the limits of our senses that Nature which for ever lies beyond them, infinite, inscrutable, and mysterious. There is, in truth, no antagonism between science and poetry, and it is their happy union in Schweinfurth's nature and culture which carries the reader, in the spirit of his own

delight in everything

"Which is Nature's, and may be
Untainted by man's misery,"

through these volumes.

Africa is the typical continent of the globe—from the almost unbroken unity of its bulk, and its equal distribution north and south of the equator. It is the largest mass of land on the face of the globe lying directly under the equator. At the extreme north and south of this vast continent we have broad belts of fertile and wooded countries; succeeded, north of the equator, by the desert belt of Sahara, and on the south by the Kalahari desert; and between these two deserts lies the great equatorial forest zone, extended broad and wide from the Albert Nyanza to Lake Tsad on the north, and thence southward from the mouth of the Conjo river and along the valley of the Zambesi to the eastern coast. It was in this central forest zone, in the region of the Western Nile, that Schweinfurth pursued his ardent botanising.

One of the weirdest trees of the Soudan is "the whistling Acacia," or "Soffar." From the presence of the larvae of insects, which have been deposited in them, its ivory white shoots become swollen at the base, and when the mysterious insect has eaten its way out, these distorted, thorn-like shoots become a sort of musical instrument, upon which the wind, as it plays, produces a wild and melancholy note.

"Very striking is the sight afforded by the woods of these acacias in the winter months; the boughs, bare of leaves, and white as chalk, stretch out like ghosts; while the voices of a thousand flutes give out their hollow dirge. Such is the forest of the Soffar."

It was on the Bahr el Ghazal that Dr. Schweinfurth first saw the papyrus:—

"To me, botanist as I was, the event elevates the day to a festival. Here, at a latitude of 9° 30' N. are we now first able to salute this sire of immortal thought, which centuries ago was just as abundant in Egypt as at present it is on the threshold of the central deserts of Africa. I was quite lost in admiration of the variety of production of the surface of the water, to which the antique papyrus gave a noble finish. It strikes the gaze like the creation of another world, and seems to inspire a kind of reverence; although for days and weeks I was environed by the marvellous beauties which enrich the flora of the Nile, my eye was never weary of the apparition of its graceful form."

Gradually the obstructions to the navigation of the river, caused by the excessive vegetation, began to give much anxiety, and in a day or two more Schweinfurth was in actual conflict with that extraordinary grass barrier, or world of water plants, from which the enterprising expedition of Sir Samuel Baker, in 1870-71, suffered repeated hindrances. The Ghazal is noted for the loveliness of its water-lilies—yellow, blue, milk-white, and every hue of celestial rosy red. The fame of them has come down to us in the most ancient books of the Hindoos.

In the islands of the Meshera is a strange climbing passion-flower—the *Adenia venenata*. The stem, which grows half under the soil, projects above it with a gnarled protuberance some cubic feet in content. At the end of this the stem breaks out into a number of long climbing stalks, which mount upwards to a considerable height. In describing the Parkia, one of the most im-

posing trees of the country about Ghallas Seriba, Dr. Schweinfurth, or his translator, would seem to have confused it with the Poinciana: "the leaves are not unlike the Poinciana, which is known also as the Poincillade or Flamboyer: its flowers are a fiery red with long stamens, and hang in a tuft; when they die off they leave a whole bundle of pods, a foot in length, in which the seeds are found, covered with a yellow dust. The Bongo, as indeed do the Benks of Footah Daylon, in West Africa, mix this meal dust with their flour, and seem to enjoy it." It is the flowers of the Poincillade that are fiery red—and yellow—and surely not of the Parkia. If there indeed be here the confusion suspected, whether it arose in the course of Dr. Schweinfurth writing from his notes, or of Miss Frewer translating from his text, it recalls the way in which Pliny has confused the Persica with the Persea. At page 251 of vol. i., a strange aerial tuber, eaten by the Bongo, and Niam-Niam, and other Central African tribes, is figured and described. The bulbs of this plant (*Helmia bulbifera*) protrude from the axils of every leaf on the climbing sprouts, and are in shape like a great Brazil-nut—the section of a sphere with a sharp edge. In bulk and taste they correspond with the potato. They frequently grow wild, but then produce much smaller bulbs. Another kindred species is also found wild. The Bongo also form a substitute for salt, of which there is an entire deficiency in the basin of the Ghazal, from the ashes of the burnt wood of *Grewia mollis*, a shrub common throughout Bongo-land, and which is notoriously useful in another way by the quantity of bast which it produces. Most of the cultivated grains, vegetables, and fruits noted by Schweinfurth are identical with those found in the fields, orchards, and kitchen-gardens of India. This must, for the most part, have been the result of the intercommunication of ages between the coasts of India and Africa; and particularly during the time of the power of the Portuguese in the East. In the case of some of these plants, however, it probably points to a time when Africa and India formed one continuous continent. The geology and the landscape of Eastern Africa and Western India are of the same general character. When Livingstone visited Bombay in 1866 he said that he could scarcely believe, when ascending the Ghats, and crossing the country towards Poona, that he was not in Africa. The close affinity between the natural flora of the two countries every page of Dr. Schweinfurth's two volumes testifies to overwhelmingly. He seldom names an indigenous African plant of the same species as are found in Western India, but he scarcely ever mentions one of which there is not some generic representative in India. There are, however, several African plants which are also Indian, of which the *Delphinium dasycaulon* of Abyssinia, the brilliant larkspur, well known to all who have climbed the hills of the Deccan, is perhaps the most striking example. Dr. Schweinfurth notices how, in the park-like country of the Niam-Niam, the groves of *Terminalia macroptera* looked like woods of European oaks, and what a remarkable general deficiency of undergrowth

or brushwood they exhibit; and this is one of the commonest observations made by Englishmen when first they come upon the Terminalia forests of the country above the Western Ghats of India. The absence of oaks and pines in both countries is another point of resemblance between them—the more remarkable, as regards the absence of pines, from the solitary exception—which emphasises the rule—of the existence in both countries of the anomalous *Gnetum*. These facts are strong evidence against the hypothesis of the elevation of the Sahara in historic times, and of the circumnavigation by the Carthaginians of the African continent by means of an extension of the Mediterranean through the desert to the Indian Ocean. In the Monbutto country one day Dr. Schweinfurth picked up beside the pathway through a wood, the gigantic pod of *Entada scandens*—three to four inches long, and four to five inches broad—formed in a series of joints, each containing seed. On searching for the plant to which it belonged, he was astonished to find it to be a deciduous creeper, with one of the smallest flowers of all the sweet-pea family. This plant is one of the commonest wild plants of both Western India and the West Indies; but as it is found wild not only all over tropical Africa, but in the very heart of Africa, it must be a native of the latter country, and was probably borne to the two Indies by ocean currents. Its seeds are often now picked up on the shores of Nova Zembla and of Portugal and Spain. This was one of the circumstances from which Columbus was led to conclude the existence of the Americas, although the seeds on which he partly founded his argument may really have been brought, by the round-about way of the north or south equatorial ocean currents and the Gulf Stream, from the neighbouring shores of Africa. From the local tradition of the introduction of the cocoanut tree into Ceylon, it would seem probable that it was naturalised in India from Central America through the agency of ocean currents within the heroic period. Dr. Schweinfurth found the plantain thriving so vigorously everywhere, that he believes it to be a native of Africa; and for the same reason he thinks that it is quite an open question whether the variety of the tobacco plant, *Nicotiana rustica*, the source of *Latakia*, is of American origin. It is found wild, not only in Africa, but in Europe, Asia, and America; but there is the strongest historical evidence against its being a native of any country but America, quite independent of the botanical argument that it is probably only a variety of the *N. Tabacum*, the source of Maryland Tobacco. But it is always more pleasing to leave questions in the attractive glamour of learned conjecture than to come to needless conclusions about them. The controversy concerning the plantain can fortunately never be settled. Of the scenery of the furthest limits of his wanderings in Central Africa, Dr. Schweinfurth thus writes:—

"Nothing could be more charming than that last day's march, which brought us to the limits of our wanderings. The twelve miles which led to Munza's palace were miles enriched by such beauty as might be worthy of Paradise. They

left an impression on my memory which can never fade. The plantain groves harmonized so perfectly with the clustering oil palms that nothing could surpass the perfection of the scene; whilst the ferns that adorned the countless stems in the background of the landscape enhanced the charms of the tropical grove. A fresh and invigorating atmosphere contributed to the enjoyment of it all, refreshing water and grateful shade never being far away. In front of the native dwellings towered the splendid figs [of the *Banyan* and *Peepul* kindred] of which the spreading crowns defied the passage of the burning sun. Anon we passed amid jungles of *Raphia*, along brook-sides crammed full of reeds, or through galleries where the *Pandanus* thrived, the road taking us uphill and downhill in alternate undulation. No less than twelve of these brooklets did we pass on our way, some lying in depressions of one hundred feet, and some sunk as much as two hundred feet below the summits of their bounding walls of verdant vegetation. . . . On either side there were an almost unbroken series of the idyllic homes of the people, who hurried to their gates, and offered us the choicest products of their happy clime."—(i. 557.)

Above the forest towered magnificent *Azalia*, *Filaea*, *Albizia*, *Ficus*, and *Syzygium*; and below, clustered shrubs of *Randia*, *Sparmannia*, and *Musaenda*, with its large white bract, whilst in the thick-set shades shone the splendid blossoms of the *Haemanthus*, *Gloriosa*, and *Chlorophytum*, together with *Orchids*, *Arums*, and the wonderful *Kosaria*.—

"Everything seemed to conspire to render the scenery perfect in its bewitching grace; each winding of the brook would be overarched by a magnificent canopy of gorgeous foliage; the waving pendants of the blooming shrubs would shadow the secluded stream; a fantastic wreath of elegant ferns, growing up amongst the goodly leaves of the *Aroideae* and the ginger-plants, would adorn the banks; gigantic stems, clothed with accumulated moss, would rise upwards in majestic height, and reach down like steps in romantic beauty to the bathing-place."—(ii. 61.)

Dr. Schweinfurth's work is very rich in ethnological observations, of which, in contrast with the flora of the countries traversed, it may well be said—

"every prospect pleases,
And only man is vile."

He gives a terrible account of the Egyptian slave trade, now chiefly carried on through Darfoor, "the Bokhara of Africa." The agents of the trade, more frequently than not, are priests:—

"With the Suras of the Koran in one hand and the operating knife in the other, they rove from Seriba to Seriba all over the country, leading what might be termed, in the most rigid sense, a life of perpetual prayer; . . . but never did I see slaves so mercilessly treated as by these fanatics, and yet they would confer upon the poor souls, whom they had purchased like stolen goods for a mere bagatelle, the most religious of names, such as 'Allagabo' (God-given). In one of their convoys were some poor, miserable Mettoo slaves, almost too emaciated to bear the heavy yoke that was fastened to their necks. Going, as I was wont, to my kitchen garden, I had constantly to pass the huts in which they were kept. One morning, hearing an unusual outcry, I paused to enquire what was the matter. A scene, such as my pen can only indignantly depict, met my gaze. A dying man had been dragged from the hut, and was being belaboured by the cruellest lashes to prove whether life was yet extinct. The long white stripes on the withered skin testified to the agonies that the poor wretch was enduring, and the vociferations I had heard were the shouts of

his persecutors, who were yelling out their oaths and their imprecations: 'The accursed dog, he is not yet dead!—the heathen rascal won't die!' Then, as though resolved to accumulate cruelty upon cruelty, the Faki's slave boys not only began to break out into revolting jeers, but actually played at football with the writhing body of the still gasping victim."—(ii. 413-14.)

"But the worst feature in the case is the depopulation of Africa. I have myself seen whole tracts of country in Dar Ferleet turned into barren uninhabited wildernesses, simply because all the young girls have been carried out of the country. Turks and Arabs will urge that they are only drawing off useless blood; that if the people are allowed to increase and multiply, they will only turn round and kill one another. But the truth is far otherwise. The time is come when the vast continent of Africa can no longer be dispensed with; it must take its share in the commerce of the world; and this can only be effected when slavery is abolished."—(ii. 437.)

Perhaps it may be that the civil engineer may yet bear the chief part in the suppression of this trade. Egypt is flanked on the west by a depression in the Sahara of from 100 to 200 feet (*teste* Rohlfs) below the Mediterranean, and extending from near the coast of Tripoli to the confines of Kordofan and Darfour. If a short canal were cut into this depression from the Syrtis Major, the Libyan desert would be converted into an inland sea, wide and long as the Caspian; and the commerce, and, if the need should rise, the arms of Europe would be borne direct into the heart of Africa,—*"Garamant extreme."*

The accounts which Dr. Schweinfurth gives of the Baggara, the Nueir, the Dinka, Bongo, Niam-Niam, and Monbuttoo, are most valuable and intensely interesting. Most graphic is his description of the fantastic figure and abominable character of Munza, the king of the cannibal Monbuttoo—a tall, powerfully-built man, stiff and erect, robed in a Dolly Varden pannier, bedizened all over his arms and legs with copper rings and chains, and crowned with a towering Haymarket chignon. "His features had a Nero-like expression of *ennui* and satiety." . . . In his eyes gleamed the wild light of animal sensuality, and round his mouth lurked an expression—a combination of avarice, violence, and love of cruelty—that Schweinfurth never saw in any other Monbuttoo. The daintiest dish to set before this ogre of a king is a fresh stewed baby, served up in a wooden charger as large as a pig's trough; and his chief amusement consists in dancing frantically to the chorus of a regular nigger breakdown before his eighty wives. This is the man who is king over all the fair forest lands watered by the crystalline fountains of the Welle—the central and typical figure of the African race. In the Akka Dr. Schweinfurth believes that he has at last discovered the mythical Pygmies of Homer, Herodotus and Aristotle. Whilst yet on the Upper Nile, his Nubian boatmen used to beguile the night with stories of these Pygmies; but he laughed at them—for the Nubians are the great story-mongers of the Nile valley, and all the legends of the ancients concerning the Nile, the Cyclops, and the Automoli would almost seem to have originated with them—and in turn entertained them with Alexandre Dumas *L'Homme à queue*. But Schweinfurth really

appears to have found them in the Akka, an isolated race of dwarfs, to the SSW. of the Monbuttoo, and who have their abodes close to the confines of Munza's dominions. They appear to be identical in race with the Bosjesmen of South Africa. Of all the tribes of men Dr. Schweinfurth met with in his way, none awaken the interest of his readers like these romantic Nubians. They have always some wonder to tell. Most fascinating is it also to find their songs and legends so often recalling the myths of the poets of Greece and Rome. "Did you ever hear, you rascals of cow-stealers," Dr. Schweinfurth once addressed some of them, "about those ancestors of yours, the Ethiopians of Meroe?" "Yes, indeed," rejoined the Nubians—

"for many and many a verse did our ancient poets compose about them, to celebrate their virtue; and they used to declare about the ruler of the gods (for in that time we believed in many gods), if he could not be found in Heaven, it was because he was lingering amongst his darling Ethiopians on earth."

Far on in his wanderings, one of Dr. Schweinfurth's Nubian servants was smitten with a sentimental fit of home-sickness. Stopping midway in the channel of a stream they were crossing in Bongo-land, as though lost in contemplation, he suddenly apostrophised the waters: "Yonder lies Khartoom; yonder flows the Nile. Pass on, O stream, pass on in peace! and bear my greeting to the dear old Bahr el Nil!" The secret of the immemorial myths of the Old World is with these men of the "blameless Ethiopians," the Phaeaces, the Cynomolgi, the Monosceles (Nueir?), Pygmies, Lotophagi, and other fabulous nations, and of the Caput Nili, the search for which is the true note of fascination of every work of African travel. Indeed, if a man should find the Caput Nili, he should hardly tell it! The increasing knowledge of inner Africa which its adventurous explorers are yearly bringing back with them to Europe, is an exceeding great gain, but it is the very least gain to popular culture of their lives of devoted daring and endurance. Men mourn for Livingstone, and deplore the loss to science of the geographical knowledge of the Southern Nile region which, probably, has perished with him; but it is rubbish in comparison with the example of a life of heroic self-abnegation, which his death, with all its grim circumstance, has brought home ineffaceably to the convictions of his countrymen. It is no fantastic conceit, therefore, to hope that it may continue as long true in the future as it has in the past, of the secret fountains of the Nile, *non contigit ulli hoc videre caput*:—ever exciting, and never satisfying the noble and fruitful desire of brave, cultivated, and accomplished men like Schweinfurth to pluck out the heart of its mystery. GEORGE BIRDWOOD.

Genealogical Tables. By Hereford B. George. (Oxford: at the Clarendon Press, 1874.)

THE want of a good selection of accurate genealogical tables has long been felt by English students of history. It is to supply this want that the work which we propose to review has been compiled. Drawing up

correct genealogics is a work of great labour, and if they are not correct the labour is thrown away.

We have examined many of the tables, and have found some of them well done; but on the whole, we have come to the conclusion that Mr. George has not devoted the necessary time and attention to the work, and that he has used very imperfect materials. We propose, therefore, to direct attention to a few points in which his book is not to be trusted.

One of the errors into which unskilled genealogists are most apt to fall, is that of ascribing all a man's children to the same wife. This error is frequently committed by Mr. George. He tells us that Isabella of Castille (tables 36 and 37) was daughter of Mary of Aragon, whereas her mother was Isabella of Portugal. John Cicero (20 a), Elector of Brandenburg, was the son of Margaret of Baden, and not of Anne of Saxony. But it is in the Lorraine genealogies that we find the most curious mistakes. Nicholas de Mercoeur had three wives and many children. Mr. George (30) only mentions one wife, the last, Catherine d'Aumale, and three children, all of whom he ascribes to Catherine, though none of them belonged to her.

Henry of Lorraine had no issue by the sister of Henry IV. His daughters were the children of a princess of Mantua.

A similar mistake occurs in the genealogy of the old dukes of Lorraine. From not knowing that Godfrey II. was married twice, Mr. George has not hesitated, in spite of the laws of the Church, to marry the Countess Matilda to her brother (50). What could the Pope and Hildebrand have been about? The fact is, it was the case of a father and son marrying a mother and daughter, another instance of which occurs in the same table. Even English families do not fare much better; the mistake is made twice in table 7, and the sons of Richard of Cornwall are both given to the same mother (3).

If it be an indiscretion to be curious about the age of ladies, we can certify that our author is frequently discreet. Judith of Flanders, the wife of Tostig and Walf, was not the daughter of Baldwin IV. (2 and 29), but of his son Baldwin V. Mr. George, or the writer whom he follows, may have been misled by the passage in which the "Annalista Saxo" calls her "amita Roberti." The Robert to whom he refers is Robert the Crusader, and not Robert the Frisian.

The father of Christina, the queen-mother of Spain, was not Ferdinand I. of Naples (38), but his son and successor Francis I.

Emilia of Saxony is represented (20 a) as the daughter of Maurice, though she was many years his senior. This error might have been corrected from the preceding table.

The failure of issue is often wrongly announced in the tables. Eleanor, sister of Charles V., left a daughter who survived her many years.

Eleanor was the third and not the second wife of Emanuel of Portugal (15). In table 26, John, son of Charles of Blois, is said to have died without issue. He left a large

family, and the Counts of Penthievre and the royal houses of Albret and Bourbon were descended from him. Jane de Commines, the daughter of Philip, was married into the Penthievre family.

Mr. George departs, we think unwisely, from the custom of placing the children of a family in the order of their birth, and he informs us that, whenever he has done so, he has put figures to indicate the order of seniority. Unfortunately, whether he puts figures or not, we cannot depend on him. He tells us that Anne, who was the eldest child of Richard Duke of York, was the fifth of his children (5), and he treats the daughters of Victor Emmanuel I. still more severely (32). His figures separate the Empress Anne (whom he calls Mary) from her twin-sister the Duchess of Parma, in order to make room between them for Christina of Naples, who was born nine years later.

But he much more frequently goes wrong when he puts no figures, *e.g.* he places in wrong order the children of Richard of Cornwall (3), of Ralph Nevill, of Richard Beauchamp (7), of Edward of Portugal (39), *cum multis aliis*. He often transposes children in order to bring about marriages, frequently unimportant, between cousins, and then forgets to place figures to restore order.

Many of the imperfections of the work arise from this. Because they married conveniently for the genealogist, persons of small importance occupy the space that is wanted for more useful names. Nowhere is this more remarkable than in table 37. In order to make room for the intermarriages of the Aragonese and Sicilian branches of the family, the lines of Urgel and Gandia have been left out, and the table throws no light on the celebrated disputed succession (1410). The omission of persons or want of dates (or both) renders the tables of little value in other cases of disputed claims, *e.g.* the claim of Edward III. to the throne of France, the disputed succession at Naples (1309), the Cleves and Juliers controversy, &c.

The absence of dates is a great defect in the work; wherever it is possible, the date of death ought to be given; and where important, the date of birth.

It is not easy to decide whom to notice and whom to omit, but we do not think that Mr. George has been always successful in his choice, and we cannot find out the principle by which he has been guided in inserting or omitting the names of the wives. A genealogical table loses half its value if both parents are not named. At any rate, no marriage ought to be passed over which is necessary for the understanding of history. Some light would, for instance, be thrown on certain events if the student were told something about the wives of Peter II. of Aragon, Alfonso III. of Portugal, and René II. of Lorraine.

The English portions are not quite satisfactory. We do not see why so many of our princesses who married into foreign families should have been omitted. The genealogy of the Nevills presented an excellent opportunity of collecting together the principal actors on both sides in the War of the Roses. This opportunity has been thrown away. Ralph Nevill had twenty-two children by two wives, only one of whom (Joan)

seems to be known to Mr. George. Only six of the children are mentioned, and these are placed in the most haphazard order. John, the eldest son by the first wife (Margaret Stafford), is put down as the fifth child of Joan. Eleanor, Duchess of Somerset, was the daughter of Elizabeth Berkeley, and not of Isabella Despenser. Henry Beauchamp (ob. 1445) was Duke of Warwick, and the singular circumstances of the case would justify giving to George Nevill his title of Duke of Bedford.

The modern portions of the work are too scanty, and we seek in vain for a reason for omitting the kings of Würtemberg and the kings of the House of Braganza. The genealogy of Sweden requires a short notice. Soon after the death (1741) of Ulrica Eleonora, Adolphus Frederic of Holstein was elected to succeed her husband. Mr. George informs us that he was elected on failure of the House of Vasa. If he means failure in the direct male line, that had already happened in 1654 in Sweden, and in 1672 in Poland. If he means failure in the female line, we beg to inform him that the House is not extinct now. If he had not uselessly taken up his space with a Holstein genealogy, he might have pointed out to his readers that Adolphus Frederic was descended from a sister of Charles Gustavus. The marginal notes are rather short, and not always accurate. Urban VII. (30) is possibly a misprint for VIII., and the treaty of the Pyrenees was not in 1661, but in 1659.

There are some errors which would perhaps have been corrected, had the work been more carefully revised. We should not have been told that Mary, Queen of Naples, was the daughter of Stephen V. (41), and of Stephen IV. (33), that Mary of Blois was married to John I. of Anjou (33), and to John II. (26).

Some dates, also, would have been altered: the Emperor Alexander I. would not have lived until 1826, nor King Frederic Augustus of Saxony until 1856; and Thomas Holland (4), who was put to death at the beginning of the reign of Henry IV., would not have been found alive in 1430. The date of the battle of Bosworth (1415) must be a misprint, and possibly also that of the execution of Buckingham (1485). The battle of Northampton was fought in 1460, and not in 1459 (4).

It may be thought that some of our objections are to faults that are unimportant. No inaccuracies can be unimportant in genealogical tables; they are consulted as authorities on many points, and unless they can be depended on they can only mislead.

Genealogies are the railroads, and genealogists are the pointsmen of history, and if they make a mistake they turn their readers on to the wrong line.

Mr. George has undertaken a thankless task. Had he succeeded, he would have gained but little credit, for few people can appreciate all that is required for drawing up accurate tables. But he has not succeeded, and he would have rendered a greater service to students if he had simply translated and abridged the genealogies of Lesage, although they are not free from mistakes.

Mr. George acknowledges with thanks the assistance which he has received from

Professor Stubbs. It would seem that the Professor's co-operation must have been afforded in the shape of advice, which has been imperfectly followed, rather than in that of corrections which have been admitted into the text.

The work cannot have been revised by any one acquainted with the subject.

H. A. POTTINGER.

The Folk-lore of Rome, collected by word of mouth from the People. By R. H. Busk, Author of "Patrañas;" "Sagas from the Far East," &c. (London: Longmans & Co., 1874.)

Miss Busk deserves great credit for the perseverance with which she has collected her extensive store of Roman folk-tales, and for the pains she has taken in grouping and marshalling them. In almost every respect her present book is far superior to the other volumes of a similar nature which she has compiled, and we may fairly look forward to receiving from her, if she unflinchingly continues her studies, such work as may be praised without reservation. At present, although her method has decidedly improved, there is still room in it for further improvement. For instance, a collector who takes down tales from the mouths of the common people ought, if professing to work in the cause of science, to give the name and address of every storyteller, otherwise the world has no guarantee for the authenticity of the transcript. This duty Miss Busk has entirely ignored, and consequently we have no means of testing the accuracy of her impressions. This is the more to be lamented inasmuch as these Roman folk-tales are often told in language unlike that in which their sister stories are narrated elsewhere. We may take as an example the passage in *Filigranata* (p. 9), which depicts one of those well-known scenes in which a prince, having kissed a relative, in spite of his wife's warning not to do so, forgets that wife and prepares to take to himself another. We have seen the kissing incident described a hundred times, but never in such a style as this:—

"Then all in the palace went to their sleeping-chambers. But the prince, as it had been his wont from his childhood upwards, went into his mother's room to kiss her after she was asleep, and when he saw her placid brow on the pillow, with the soft white hair parted on either side of it, and the eyes which were wont to gaze on him with so much love, resting in sleep, he could not forbear from pressing his lips on her forehead and giving the wonted kiss."

As Miss Busk holds forth a promise of a second series, let us hope that she will follow the good example set by Mr. Campbell in his *Tales of the West Highlands*, in which the name and address of the narrator of each story are conscientiously recorded, as well as the date and place of its narration. In that second series we would suggest also that, as a general rule, not more than one version of the same story should be given at length. The repetition of all but identical incidents soon becomes wearisome. On the other hand, variants such as those which Miss Busk has given in small print are always valuable to comparers, though they are apt to prove tedious to ordinary readers.

Miss Busk does not appear to be well acquainted with what has already been done in Italy, or is now being done, to illustrate the folk-lore of its various provinces. It seems that she "had heard it so often positively asserted that modern Italy had no popular mythology, and no contribution of special versions to offer to the world's store of Traditional Tales," that she long refrained from attempting to discover any current Italian folk-tales. At last she took to hunting

"through the bookshops, new and old, to find any sort of collection of traditional tales ready made; but only with the effect of establishing the fact that no Italian Grimm had yet arisen to collect and organise them, and put them into available shape."

It is true that she has heard of Professor de Gubernatis, but she did not see his book on *Zoological Mythology* (ACADEMY, vol. iv. p. 221) till after her MS. was in the printer's hands. Moreover, she tells us:—

"The comparatively recent *Collection of Sicilian Tales*, by Laura Gonzenbach [it was published in 1870, we may as well observe], mentioned by Professor de Gubernatis, I did not know of, and have not been able to see."

Now to send information from London to a student of Italian folk-lore residing in the capital of Italy might seem to be equivalent to sending "owls to Athens," or coals to Newcastle. It may be of use, however, to other explorers of the field to which Miss Busk has devoted herself, if we give a few references to some of the books which have already appeared, or are now in preparation, upon the subject of the Italian folk-tale.

As it happens, two of the best edited collections of popular tales which we possess come from Italy—the *Völkermärchen aus Venetien*, von G. Widder, A. Wolf, und R. Köhler, published in 1866 in the *Jahrbuch für romanische und englische Literatur*; and the *Sicilianische Märchen* (see ACADEMY, vol. i. p. 171), published by Signora Laura Gonzenbach, with Reinhold Köhler's invaluable annotations, in 1870. For several years Dr. Giuseppe Pitrè, of Palermo, has been collecting the materials for an extensive work on Sicilian Folk-tales, which is now passing through the press, and of which he has already printed several specimens, under the titles of *Saggio di Fiabe e Novelle Popolari Siciliane* (Palermo, 1873), *Nuovo Saggio*, &c. (Imola, 1873), and *Otto Fiabe*, &c. (Bologna, 1873) (ACADEMY, vol. iv. p. 441). From Venice we have, also, the *Fiabe Popolari Veneziane, raccolte da D. G. Bernoni* (Venezia, 1873). Besides these there are the *Novelline di S. Stefano*, collected by Angelo de Gubernatis in 1869, and the *Novellaja fiorentina* and the *Novellaja milanese*, both edited by Vittorio Imbriani, the former at Naples in 1871, and the latter at Bologna in 1872. In all parts of Italy, indeed, at the present moment, the tales current among the peasantry are being diligently collected and sedulously compared. Before long the Italian folk-tale will be better represented than almost any other member of the widely-spread family to which it belongs.

It is, of course, unnecessary to say that there is very little that is absolutely novel in the Roman folk-tales. The *favole* which

occupy the first third of Miss Busk's collection are variants of the old familiar "fairy-tales" to which we have so often listened—tales which, if we are not mistaken, have passed from the pens of professional Eastern story-tellers to the lips of the Roman peasantry. Some of the details are curious. Thus in "The Dark King," a variant of the Cupid and Psyche story, or that of "Beauty and the Beast," combined with "Bluebeard," the girl who opens the door of the forbidden chamber finds within it "a number of beautiful maidens weaving glittering raiment," and "a goldsmith and all his men" making ornaments, all of whom state that they are preparing the wedding apparel of the Dark King's bride. But beyond them is "a little old hunchback, sitting cross-legged, and patching an old torn coat, with a heap of other worn-out clothes lying about him," and he says he is "mending the rags for the girl to go away in who was to have been the bride of the Dark King." And soon afterwards she has to retire in rags and disgrace, after having driven a knife into the breast of her sleeping and unsuspecting lord. In a variant of the story the Deccan Punchkin, the Russian Koshchei, the Norse "Giant who had no heart in his body," the external object with which the demoniacal personage's life is mysteriously connected is a stone—which is lodged inside the head of a bird, which lives inside the head of a leveret, which resides inside the central head of a seven-headed "hydra." When this stone is placed under the pillow of the demoniacal being, who is represented as a wizard or magician, he gives three terrible yells, turning himself round and round three times, and falls dead." The incident has been interpolated in a version, evidently derived from a literary source, of the story of "Aladdin's Lamp." In a Roman version (apparently borrowed from modern Greece) of the strange myth of the king who insists upon marrying his daughter because her foot is exactly fitted by her dead mother's shoe, the princess escapes from her father inside "a figure of an old woman just like life, fitted with all sorts of springs to make it move and walk when one gets inside it, just like a real woman." In "The Two Hunchbacked Brothers" we have an unsatisfactory version of a fairy story well known in Celtic lands. A hunchback is surrounded on a wide moor by "a whole host of little hunchbacks," who dance around him, chanting plaintively—

"Sabbato!
Domenica!"

many times. At last he chimes in with the word "Lunedì!" whereupon both he and they lose their humps. His equally hunchbacked brother having tried the same experiment, and having added the line "Martedì!" to the song of "a tribe of hunchbacks," which ran—

"Sabbato!
Domenica!
Lunedì!"

receives from them a drubbing and an added hump. The story is unintelligible and unreasonable in its Roman dress. In the form in which it appears in the *Siddhi Kūr*, it is perfectly intelligible, and, certain premisses being granted, completely reasonable. More-

over, the Celtic tale is fraught with but a small amount of moral teaching, while the Italian tale can boast of none at all; but their Mongolian elder sister is absolutely replete with edifying doctrine.

After the *favole* in Miss Busk's collection follow a number of "Legendary Tales," "Ghost and Treasure Stories," "Ciarpe," &c. The ghost stories are disappointing, and the jocular tales have unavoidably suffered greatly in transit. Still there is much that is interesting to be discovered among them, and they will doubtless be appreciated by many readers to whom the *Sicilianische Märchen* and the *Völkermärchen aus Venetien* are sealed books. W. B. S. RALSTON.

NOTES AND NEWS.

THE author of *Prince Florestan* turns out to be a young gentleman pursuing his studies at Caius College, Cambridge, Mr. John de Soyres. Mr. de Soyres is already known in University circles as the writer of some of the best things in a little periodical called the *Light Green*.

MR. C. I. HERMANS is engaged on a work, in one volume, which, though destined as a new edition of one published some years ago at Florence, will be, in fact, essentially a new work, and almost entirely rewritten; the title (also new) to be *Historic and Monumental Rome*. It is his object to consider the monuments of antiquity rather from the historic than the purely archaeological point of view, and to dwell rather on the institutions and principles which those monuments may be said to represent, than on their constructive character or actual state in ruin. The earlier Christian antiquities will also be noticed; and the general scope of the forthcoming volume may be described as a brief review of the entire range of the more important among extant monuments at Rome, comprising the Christian and the classical, from the origin of the city till the period when temporal power passed into the hands of the Popes. Messrs. Williams & Norgate will be the publishers.

WE are informed that Admiral Sherard Osborn has had in preparation for some time past, and will shortly publish, a naval work on the Reserve Forces, which cannot fail to be of great value.

THE *Nation* has been prosecuting a series of researches into the history of plum-pudding. It appears to differentiate itself from plum-porridge about the year 1747, but the exact manner and date of the evolution are not clear. Some faint glimmerings of the plum-pudding have been discovered by the historian in a cookery-book of 1734, and the momentous revolution which has ended in the dethronement of plum-porridge, and the firm establishment of plum-pudding as its successor, appears to have been going on for many years after that date.

APROPOS of Mr. Symonds' review of Brome's Dramatic Works in our last number, a correspondent reminds us that Pope has deemed Brome worthy of a passing mention in the *Dunciad* (i. 146). Bays is sitting surrounded by his books; there are Fletcher, Molière, and Shakspeare, and, serving but to fill a room, Quarles, Ogilby and Newcastle. Hither retire all Bays's suffering brotherhood:—

A Gothic library! of Greece and Rome
Well purged, and worthy Settle, Banks, and Broome.
Brome, remarks Pope in a foot-note, "once picked up a comedy from his betters, or from some cast scenes of his master, not intirely contemptible."

WE understand that Messrs. Henry S. King & Co. are about to issue a cheap edition of the Laureate's works, in ten monthly volumes, to be entitled "The Cabinet Edition." The same firm will issue very shortly the *Daily News Correspondence* during the Ashantee War.

We are glad to see that some well-known men in Birmingham, Messrs. G. D. Boyle, J. H. Chamberlain, George Dawson, Sebastian Evans, &c., have put their names to a strong commendatory circular about Mr. Horace Howard Furness's admirably careful *variorum* edition of Shakspeare. The book is now to be bought at the very low price of 12s. 6d. for cash, a volume, each volume containing a play, and, as the Birmingham men say:—

"So elaborate and costly a publication can, under no circumstances, repay its editor for his labour of love and his untiring industry; and it is, therefore, thought desirable, in the interests of international literature, that an edition of Shakspeare edited and printed in America, so well worthy of support, should be more widely known."

THE *Francis* states that in pulling down an old house at Saint-Ouen (Seine), there was found concealed a manuscript of the beginning of the seventeenth century, containing indications relative to some rare books, for which a search had been ordered by the Parliament of Henry II., who had condemned them or ordered them to be destroyed. They had been placed in boxes with other valuables, and sunk in the Seine. The discovery of the manuscript of Saint-Ouen is said to be of great archaeological importance.

A NEW German epos, having for its subject and title the name of the inventor of printing, Johannes Gutenberg, by Adolf Stern, is spoken of with much praise as one of the ripest poetical productions of the present. The great historical character of Gutenberg, it is observed, has never been treated before by a German poet.

"ANASTASIE," which in the popular Parisian dialect designates the Censorship, deals respectfully with Victor Hugo, but visits his sins upon the rank and file of his followers. It has just prohibited the publication by *L'Ecluse* of a cartoon called *Quatrevingt-Treize*, by the caricaturist André Gill. To people less skilled in the discovery of seditious allusions than the literary detectives of the Censure, the drawing appears harmless enough. It represents Victor Hugo carving the busts of the three revolutionary Titans—Danton, Robespierre, and Marat. Issuing from the sculptor's pocket, Georgette, the baby heroine of *Quatrevingt-Treize*, traces with her little finger on the base of Marat's bust vague childish words: "Coco—poupoupe." In vain Victor Hugo wrote to the Censure affirming that the artist had faithfully interpreted the spirit of his work: "Anastasia" permitted the romance and suppressed the illustration. This is Victor Hugo's letter: "I have seen the beautiful drawing of André Gill. It is not only beautiful—it is charming. The child's figure contrasting with those severe and terrible faces expresses gracefully and gaily the spirit of the book *Quatrevingt-Treize*; and it is seemly that there where human passions make us tremble, innocence should make us smile."

THE French Parnassian school has a peculiar range of subjects. When it is not hyperbolically Asiatic, it is trivially homely; when it is not homely, it is extravagantly sinister and sanguinary. M. Catulle Mendès possesses the monopoly of the bamboos and elephants; M. Coppée has imagined the type of the "little Grocer" who "tristement cassait du sucre;" M. Alfred Touroude purposes becoming the chief of the last category. He has in the press a poem of a thousand lines, entitled *L'Echafaud*, which is intended to be a poetical pendant to the *Dernier Jour d'un Condamné*. The poem simply consists in the soliloquy of the scaffold after the execution of an "illustrious" criminal. The moral pointed is against capital punishment; but the means employed are perhaps not likely to prove very efficacious.

By the death of his former secretary, M. Veres, Kossuth's name is again brought before the public. M. Veres having died on Hungarian territory, the Austrian Government has seized a number of

private documents belonging to the ex-dictator with the professed object of placing them in the historical department of the Museum of Pesth. Kossuth has written a letter to several Hungarian newspapers protesting in vivacious terms against this arbitrary confiscation. "My archives," he writes, "are private property; and if my name has been connected with the history of my country, the fact affords no excuse for the commission of an injury that would not be tolerated against an ordinary individual."

THE Ollivier and Guizot scandal has terminated somewhat unpleasantly for the Protestant historian. Immediately on hearing of the discussion in the Academy, the Empress telegraphed to an influential Bonapartist: "Since M. Guizot continues to pursue the Empire with his hatred, I will furnish you with proofs of the fact that M. Guizot's son solicited and obtained favours from the Empire." But two hours afterwards a second telegram was received from Chislehurst: "I hear of the death of M^{me}. Cornélis de Witt, M. Guizot's daughter. In presence of a father's grief I desist. Consider my first telegram as null and void." M. Guizot has enemies, however, who are less merciful. It transpired that some three years before the fall of the Empire, M. Guillaume Guizot, having incurred large liabilities, appealed to Napoleon for succour. He succeeded. His debts, amounting to 30,000 fr., were paid by the Emperor. This sum has just been re-paid by M. Guillaume Guizot to the *caisse de consignation*, to the account of the Empress Eugénie.

THE literary element in the present House of Commons is not much inferior to that of its predecessor. The great chiefs have but changed sides, and the most notable loss—Professor Fawcett—is one which seems likely to be only temporary. Mr. T. Hughes has given place to the author of *Gin's Baby*, and Mr. Forsyth more than fills the vacancy made by Mr. Wren-Hoskyns' retirement. Sir John Lubbock, Mr. Massey, Mr. Beresford Hope, and Mr. Baillie Cochrane still retain their seats; and Mr. Knatchbull-Hugessen, in exchanging office for opposition, will have leisure to make his Christmas fairy-tales more than usually effective. The representatives of the press (if such they may be termed) are reduced in number by the loss of Messrs. Baines and Miall, but the "fourth estate" has received an indirect compliment through the elevation of Mr. W. H. Smith to the Treasury Board. Men talk of the days of Addison and Prior as if political life was then more largely influenced by men of letters than is now the case; but, as a matter of fact, success in statesmanship and authorship has been very rarely attained by the same individual until comparatively modern times. The Parliament in which Addison sat (and spoke but once) contained not more than three members whose names are permanently associated with literature.

THE old-fashioned company of the *Caveau* flourishes unheard, if not silent. It continues to elect vaudevillists, to give dinners, and publish an annual collection of songs for dessert, even as when it possessed a famous almanack, and was presided over by Piron and Gouffé. There is a strong vitality in France in all institutions that bestow medals, diplomas, the honours of print, that afford any species of official balm to the vanity of the Great Unknown. Perhaps the most popular corporation of this kind is the Académie des Jeux Floraux, of Toulouse, founded by Clémence Isaure, the Provençal poetess, for the encouragement of poetry and eloquence. The Académie holds annual competitions, whereat it distributes branches of eglantine, wrought in gold, to the successful candidates. It has received this year no less than 630 works in prose and verse. The latter category is by far the largest, numbering 249 general pieces; 74 odes; 43 narrative poems; 30 epistles; 8 orations in verse; 35 idylls; 60 elegies; 30 ballads; 36 fables; 38 sonnets; 21

hymns. There are but ten prose offerings. And the only poet of distinction who has carried off an eglantine at Toulouse is M. de Robespierre!

MESSRS. BICKERS & SON will shortly issue a new edition of Boswell's *Life of Johnson*, in three volumes octavo. It will be edited by Mr. Percy Fitz Gerald, M.A., and will reproduce the original text of Boswell's first edition, with the old spelling, punctuation, and paragraphs, and without the division into chapters. The accretions of Malone and Croker will be dismissed from the text, and the notes will be in great part original, and in many cases from unpublished manuscripts. The *Journal of a Tour to the Hebrides* will be restored to its place as a separate work, and the text carefully collated on the three editions.

THE most noteworthy point in the Report for February last of the Superintendent of the American Public Libraries is the popularity of Mrs. Southworth's novels. They are apparently in greater demand than those of any other writer of prose fiction; and out of 400 volumes of her works in the library, 52 only remained on the shelves. We believe that this is the case in other American libraries beside Boston; and it is singular that, in spite of her reputation in America, Mrs. Southwell's very name is almost unknown in this country.

DR. FRIEDRICH NIETSCHE, Ordinary Professor of Classical Philology at Basle, is quite considerable enough to be justified in publishing *Unzeitmässige Betrachtungen* (Leipzig: Fritsch), though they seem likely to contain more denunciation than discussion. The first instalment, devoted to the late Dr. Strauss's confession of faith, was published in that author's lifetime, though it reaches us after his death. Dr. Nietzsche respects Dr. Strauss's scientific writings, but his popular work fills him with angry contempt, chiefly on the ground that he has addressed himself to the Culture-Philistines, who have been stimulated into such unwholesome activity by the late war, which led them to believe that instruction is culture, and that the German victories were due to superior culture, both which propositions Dr. Nietzsche denies. If his denunciations are attended to, they will do good; but we wish the writer had asked himself whether the author of the Funeral Oration of Pericles was a Culture-Philistine. The most telling part of the criticism on Strauss is the way in which the suggestion that perhaps God, like Lessing, prefers the search after truth to truth, is retorted. "The Culture-Philistine can stand a God who makes mistakes better than a God who works miracles; he and his fellows make mistakes themselves." Foreigners who have been used to think Strauss's style good for a German will be sorry to be forced to admit that in ceasing to be cumbrous he became incorrect. After this it will cost them little to admit that his ornaments were sometimes mechanical.

THE manuscripts presented by Mrs. Grote to the British Museum are contained in twenty volumes, of which the principal are: Four sheets of the original MS. of the *History of Greece*, with Mr. Grote's corrections; five volumes of notes and collections, chiefly relating to Grecian History and Philosophy; Essays on the Grecian Colonies, especially those of Italy and Sicily, with notes by John Stuart Mill, written between the years 1824 and 1840; digests of the Dialogues of Plato, written before 1830; Character of Socrates, 1825 or 1826; notes on Roman History, B.C. 263-50; First Century of the Saracenic Empire; abstract of the History of Italy, to the Peace of Worms, &c.; Essays on Lucretius, on Cicero's *De Oratore*, &c.; translations in verse from the Latin and Greek, with original stanzas; poetical pieces and translations, 1812-1817; essays and notes on Logical and Metaphysical subjects, about 1812-1822; on Harrington's *Oceana*, the Feudal System, Predication, Education, &c.; essay on Magic, written in 1820; notes from Humboldt's *Cosmos*, &c., &c.

OTHER recent additions to the manuscript department are: a volume of letters from naturalists

to Dr. Solander, J. L. Phillips, J. E. Gray, and others, between the years 1768-1837; Register and Muster Roll of the Commoners of Winchester School, 1784 and 1822; Catalogue of the Icelandic MSS. of Finn Magnúsin, 1830; and a German Treatise on Magyar Poetry, biographies of the Poets and collection of the Poetry, by Dr. G. C. Romy, 1828.

THE last issue of *The Herald and Genealogist* contains a lengthy and interesting account of Sir Thomas Phillipps and his marvellous collection of manuscripts. With reference to the same subject the following extract from the manuscript diary of a well-known antiquary, now some ten years deceased, has been sent to us for publication. The passage quoted relates to Middle Hill, in Worcestershire, the residence of Sir Thomas Phillipps before he went to Thirlestane:—

"I approached the place from Moreton-in-the-Marsh, which I had reached from Oxford in one of those old-fashioned vehicles, the square stage-coach, very heavily laden with passengers and packages of game and such things, this Christmas time, December 24, 1852. It was, however, glorious travelling from London to Oxford by an express train which stopped not till it reached the Didcot Station, and then only for a minute or two. I stayed at Middle Hill till Monday morning the 27th. . . . Only Sir Thomas and Lady Phillipps were in the house, with two maid-servants, their whole establishment and the house made almost uninhabitable through the vast amount of MS. matter of all kinds which is stored within it. The dining room has long ceased to receive guests or the family themselves, and all goes on in a small room, a sort of breakfast room, but called the drawing room, and even here they are crowded up with box upon box, besides a large book-case. The boxes are plain deal with a glass to let down in front, made on one uniform plan and size. With these the house is crammed from top to bottom, bed-rooms and all. To go along the passages we pass along a narrow avenue, just wide enough for one, between tiers of these boxes. At a guess I should say there may be five or six hundred of them, all full, besides what are in book-cases or strewn loose on the floor. There is a catalogue of the MSS. comprehending about 13,000 articles, and the boxes are numbered, but there is great difficulty in his finding anything which one asks for. . . . Lady Phillipps submits to all this, and to the seeing no company with the best grace. Everything wears the appearance of neglect."

THE German papers announce that the Oxford degree of Doctor of Civil Law is to be conferred on Dr. Reinhold Pauli, of Göttingen, in consideration of his great merits as an historian generally, and as the author of various works elucidating the history of England specially, as his continuation of Lappenberg's *History of England*, his *Pictures of Old England* (Gotha, 1860), and his *Contributions to English History* (Leipzig, 1869).

GREGOROVITUS' great work, *Geschichte der Stadt Rom im Mittelalter*, the first volume of which was published in 1859, after having been allowed to be read for fifteen years, has at last been put upon the "Index" by the Congregation of the Papal See as an "Opus condemnatum in originali Germanico et in quovis alio idiomate." This condemnation is attributed not only to the Italian version, which has been commenced at Venice, at the expense of the Roman "Municipium," but still more to the concluding chapter of the last volume referring to the downfall of the Papal State since 1871.

DR. RUSSELL and Mr. J. P. Prendergast, the editors of the *Calendar of State Papers relating to Ireland, James I.*, in their preface to the second volume, published this week, raise a question of peculiar interest to students of Shakespeare at the present time. A paper, the date of which they assign to 1604, or early in 1605, described as the discourse

of "John Hunter on the state of Ireland," contains the following passage:—

"The Earl of Kildare (grandfather to the now Earl of Kildare), who married the Marquis Dorset Gray's daughter, being Lord Deputy of that realm in King Henry the Eighth's time, was called into England, disgraced and attainted in Ireland. After, he died in prison in England, where he lived a long time, and his brothers and eldest son were deprived of their lives by the sinister practices of Cardinal Wolsey, set forth at large in the Irish Chronicle, and of late acted publicly upon the stage in London, in the tragedy of the life and death of the said Wolsey, too tedious to be reported to your Majesty."

This allusion to a recent representation on the stage of the tragic story of the Earl of Kildare and his kindred, might at first sight very naturally be explained by the passage in the first scene of the second act of Shakespeare's *Henry VIII.*, in the conversation of the "two gentlemen" on occasion of the attainder of "the Great Duke of Buckingham," in which, as in the above passage, the ruin of the Kildares is distinctly traced to the machinations of Wolsey. If it were certain that Hudson's allusion is really to this play of Shakespeare, the passage would be of great interest as determining the well-known controversy as to the date of that play. Johnson and Steevens are of opinion that it was written before the death of Queen Elizabeth, March 24, 1602-3; while Mr. Collier, on the contrary, is satisfied, both by internal and external evidence, that "it came from the poet's pen after James I. had ascended the throne," with which opinion Mr. Dyce agrees.

"If, therefore" (write the editors), "it were certain that the play to which Hudson refers is really Shakespeare's drama, now known as *King Henry VIII.*, the allusion to its having been 'lately acted publicly on the stage in London,' would be a strong confirmation of Mr. Collier's opinion as to the date of its composition. But it must be confessed that this is by no means clear. Hudson not only does not speak of this play to which he refers as Shakespeare's, but even names it by an entirely different title, *The Life and Death of Cardinal Wolsey.*"

Henslowe, in his Diary, refers in numberless entries of the year 1601, to the charges incurred in getting up a play, which he calls *The Booke of Carnalle Woolseyes Lyfe*. It was written by "Harye Chettell." This piece is, however, no longer extant, and as nothing is known of its contents, it is impossible to argue from intrinsic evidence whether Hudson really alludes to it in the passage which has been cited. But as Chettell's play was produced on the stage in 1601, while Hudson's "discourse" is certainly not earlier than 1604, and probably belongs rather to 1605, it may be argued that "Carnalle Woolseye" would hardly, at that date, be spoken of as "of late acted publicly on the stage in London." There is an entry, too, in the Register of the Stationers' Company, under February 12, 1604 (1604-5), of the "enterlude" of *King Henry VIII.*, which Mr. Collier holds to be no other than Shakespeare's play. From the various considerations we have above indicated, Dr. Russell and Mr. Prendergast hold that

"it is not too much to say that, as far as regards the date merely, the passage in Hudson's Discourse appears on the whole to be a confirmation of the opinion of Mr. Collier and the later commentators as to the year in which Shakespeare's *King Henry VIII.* was first produced on the stage."

WE have received a letter from Mr. Finlason, too long for insertion, in which he argues that when the well-known rules of evidence are applied to the case of Mary Queen of Scots, there is "not any evidence against her," though there is terrible evidence against her accusers. Elizabeth and the Regent Murray had an interest in calumniating her. The murders of Rizzio and Darnley were "both perpetrated by the same parties, and with the same fell purpose of depriving Mary of support and driving her from her throne, under a dreadful weight of obloquy, into England." Mr.

Finlason points out that as soon as the pretended confession of Paris was obtained, he was murdered by Murray, and that "it is impossible not to see that it was to cover his own share in the crime." The murderers of Darnley "had made" Darnley "concur in the murder of Rizzio," that they might "supply a motive" for the crime of murdering Darnley which they "intended to impute to her." The explanation of her marriage with Bothwell is that she was "in the hands of a ravisher," and it is an undoubted fact "that Bothwell" and the murderers of Darnley "were in confederacy as to the seizure, the forcible cohabitation, and the subsequent marriage." Mary after this "had as a woman no alternative but marriage," and she knew that her abduction could only have been effected with the connivance of the conspirators. The accusation as to the murder of Darnley was made against Mary when she was in Elizabeth's custody. The Casket letters were never produced to the accused, and there is no evidence that any such letters ever existed. Neither Murray nor any one else ever ventured to swear to Mary's handwriting in the letters. Elizabeth herself wrote that "the evidence is insufficient."

As regards the charge of complicity in the pretended plot of Babington, Mr. Finlason says that "there is no evidence of any such plot," that the letter only exists "in the decipherment of Phillips, the unscrupulous emissary of the unscrupulous Walsingham," and that Mr. Mackay admits that the interpolation is "not quite consistent with the context." But "there is no evidence of any of the letters." They must have come into Elizabeth's hands if they existed, and why were they not produced?

THE number of the *Revue des Deux Mondes* for March 15 contains an interesting article by M. Maxime du Camp, on "L'Etat Civil à Paris," in which the history of the present system of registration of births, marriages, and deaths is summarised; particulars given of the means taken for supplying the registers burnt during the Commune; and conclusions drawn from the statistics of the last few years, which are of the utmost gravity as regards the prosperity and almost the future existence of France.

The first registers (*registres curiaux*) were kept exclusively by the clergy. The most ancient in Paris are—that of marriages at Saint-Jean-en-Grève, 1515 (twenty-one years before parochial registers were established in England by Cromwell, Lord Essex); those of baptisms at Saint-André des Arts and Saint-Jacques la Boucherie, 1525; and those of deaths at Saint-Josse and Saint-Landry, 1527. The records were very carelessly kept, names were wrongly spelt, or even omitted altogether, and one register in 1603 contains the very cool entry, *Hic desunt multa matrimonia*. Curious entries were made by some of the subordinates, to whom the task of registration was too often committed. Thus, at the church of St. Paul a priest enters various presents, a bottle of hypocras, a cheese-cake, a wild rabbit, a Spanish pistol; after the record of a funeral, he notes, "This day the vicar commanded me to dine with him, where by his grace I had good cheer; *vivat ad multos annos!*" The next day the good cheer had borne fruit, and the worthy ecclesiastic records that he was obliged to take physic for a fit of the colic. Sometimes the entries are of historical importance, as showing the state of public feeling at the time; one regarding the murder of Henry IV. shows the detestation with which he was regarded by the priests, and ends with the prayer for his assassin, *Anima illius requiescat in pace!* In 1530 was passed the ordinance of Villers-Coteret, which, among other particulars, required the day and hour of birth to be stated, and forbade the preservation of the bodies of ecclesiastics. The latter custom, of concealing the bodies of deceased ecclesiastics, was very common, as the Pope enjoyed the right of nominating to a vacant benefice if the king had not already bestowed it. The registers, however, were still very

carelessly kept till the royal declaration of d'Aguesseau, passed in 1736, compelled the parish priests to make the entries regularly, and to deposit a duplicate in the record-offices every year. After this no change was made till the Revolution, when the present system was established. All the parish registers, those of the Protestant and Israelite consistories, and the archives of the embassies of Sweden, Denmark, and Holland, recording the *état civil* of the Protestants between the revocation of the edict of Nantes and the meeting of the States-General, perished under the Commune.

It is well known that John Talbot, first and greatest Earl of Shrewsbury, was buried, according to his own desire, at Whitechurch, in Shropshire, and that when the old church fell down, in 1711, a silver urn containing his heart was found among the ruins. Some workmen who have been engaged in removing the great warrior's recumbent effigy, have now brought to light his bones, which were probably interred after the burial of his heart. The wooden coffin in which they were enclosed perished on exposure to the air, but the bones themselves were perfect, and all of them were found to be encased in the cerements in which they had been placed when transported from France. The back part of the skull had been injured by some sharp instrument, and from its appearance the wound must have been inflicted when the gallant Earl had fallen to the ground—fighting perhaps, as Shakspeare has it, "on his knee." The remains have been placed in a new oak coffin. This will be deposited beneath the canopy, which it has been thought necessary to restore.

NOTES OF TRAVEL.

THE theory which Professor Agassiz broached some little time back, that a branch of the Gulf Stream has, within the last few years, taken from the Gulf of Guinea a south-west course, embracing the Falkland Islands, is quoted in the last report from that colony as accounting for the temperate winters of late enjoyed there, to the great advantage of pastoral interests. It is certain, at any rate, that thirty years ago the winters were much more severe than they are now, for it can be tested by comparing the range of the thermometer in the logs of the ships *Erebus* and *Terror* during the first commission of those vessels in 1842, when they wintered at Port Louis, with the meteorological returns now furnished to the Trinity Board by the keeper of the Cape Pembroke lighthouse.

DR. HIRSCHFELD has been commissioned by the German Imperial Government to undertake a voyage in Asia Minor, with a view of making archaeological researches in the less well-known localities of the district, and chiefly with the view of securing for the National Museums at Berlin such works of art and antiquities as may be deemed of interest.

THE Black Sea in 1871 swarmed with mullet of five kinds or sizes: paczoss, 4 to 5 lb. in weight; the kefal, 2 to 3 lb.; the plaliryna, $\frac{1}{2}$ to $\frac{3}{4}$ lb.; the slaria, three-year-old fish; and the mavridia, or yearlings; besides mullet spawn. In 1872, kefal, plaliryna, and paczoss disappeared at once, but slaria were still plentiful; in 1873, hardly a mullet was to be seen; even mavridia and spawn disappeared entirely. The cause of this disappearance of mullet is stated by a correspondent of the *Levant Herald* to be the closing of the lagoons of the Danube, where the fish spawn and fatten in summer, by a company of Galata merchants who have obtained a concession of these lagoons. Mullet and salmon must take a cruise in salt water, or they no longer spawn, and, what is worse, they die of cold in the frozen waters of the Danube during winter. The Galata merchants also caught all fish without distinction of size.

At the suggestion of the Imperial Government, special attention is being directed in Russia to the

extreme east of Asia, which may have the effect of throwing the Khanats, the western half of Central Asia, temporarily into the shade. The various Russian scientific societies are now strongly taking up the questions of developing the resources of the island of Saghalien and the promotion of commercial relations with China. The Society for the Promotion of Russian Trade and Industries has very warmly entered into a project, drawn up by Mr. Butkofski, for the working of coal mines in Saghalien. He proposes to start a company with a capital of 7,500*l.*, for the working of the mines, and for the exportation of the coal to China and Japan. The necessity of securing possession of the entire island, with the view of making it a penal settlement, is strongly urged upon the Government.

Mr. Sosnoffsky has been sent to China with instructions to make his way back to the Black Irtysh, exploring the line of a newly contemplated trade route, along which all the traffic from China may pass into Russia by the eastern extremity of Kashgaria. This project, if carried out, will naturally draw the Russians to Turfan and Aksu, and lead in time to the early absorption of the dominions of the Atalik, who is already menaced on the north.

THE Russian expedition for the exploration of the delta of the Oxus will be composed of fifteen persons, each one superintending a different branch of scientific study. Lieutenant Ghazi-Vali-Khanof will be interpreter, Mr. Moref secretary, Mr. Karazin historiographer. The topographers will be appointed by the Governor-General of Turkestan, and the heads of the various scientific branches will be selected by the Council of the Imperial Geographical Society. Colonel Stoletof, who was succeeded at Krasnovodsk by Colonel Markozof, is named assistant to the Chief of the expedition, the young Grand Duke Constantine having accepted the presidency of the Commission.

PRINCE SVIATOPOLK SLIRSKI is expected to succeed General Kauffman as Governor-General of Turkestan. Prince Sviatopolk belongs to the staff of the Grand Duke Michael Nikolaevitch, the Lieutenant of the Caucasus. It is said that the Prince's qualification for the post is a lightness of hand in the government of Orientals.

FROM Japan we learn that a meeting of the branch of the Asiatic Society was held at Yokohama on January 14, the president, J. C. Hepburn, Esq., M.D., in the chair. Captain Bridgford read a paper on "Yezo, a description of the Isbi Rari River," and the new capital, "Satsporo," for which he received a vote of thanks. Sir Harry Parkes, K.C.B., said that he believed Captain Bridgford's paper to be the first account that had been made public respecting the centre of Yezo.

THE time fixed as a limit for sending in the two Prize Essays on the Opium Question in India and China (first, 200*l.*; second, 100*l.*) is the end of May.

MR. ROBERT HART, Inspector of Imperial Maritime Customs in China, has directed the commissioners of customs at the open ports to prepare a full statement of the material products and resources of each of the provinces in which their ports are situated, for publication among the documents of the Customs Department. Among the Customs documents, valuable medical reports and trade reports have appeared, the latter for several years past.

A LETTER has appeared in the *Edinburgh Courant* from Mr. D. Maclaren, chairman of the Edinburgh Chamber of Commerce, stating that the rapid extension in recent years of the poppy cultivation, now embracing 400,000 acres, has very much limited the area applied to the growth of wheat, and has thus helped to intensify the sufferings of the people in Bengal, and the difficulties of the government of India. The desire felt by the Finance Department in India to

cheapen the price of opium, in order to extend the trade, and to compete with the Chinese poppy growers, was the cause of this extension, which took place under the direction of the late Mr. Wilson.

THERE would seem to be a prospect of prosperous times for Johore, for we learn from the *Straits Times* of Singapore that

"owing to the exceptionally high price of gambier and black pepper, many fresh plantations are being opened up on the Johore territory. Almost daily applications are being made by Chinese for grants of land, and they do not scruple to take it in localities at distances from water communication hitherto deemed impracticable and unprofitable. Although the soil of Johore is capable of producing other articles of commerce than gambier and pepper, yet, with a few exceptions, these are the only articles raised for exportation in any considerable quantity."

It is proposed to connect South Australia with West Australia by constructing an electric telegraph between Port Augusta and Albany, King George's Sound, at the joint cost of the two colonies. Mr. Charles Todd, Postmaster-General and Superintendent of Telegraphs, has reported to the Government of South Australia on the proposed line from Port Augusta to Eucla, the cost of which he estimates at 36,000*l.*, or 38,000*l.* if iron poles are used, and at 30,000*l.* if timber poles are used.

IN Banat, in the south-west angle of Hungary, there lies adjacent to the Danube a strip of sandy waste, about five miles long by from one to two miles in breadth, traversed by sand dunes or ridges, which run uniformly north-west and south-east. The same feature is observable near Vienna, and the Austrian Government has expended upwards of 2,000,000 guilden (about 200,000*l.* sterling) with a view to reclaim these lands, but hitherto with only partial success. Fresh efforts will, however, soon be made to conquer the difficulty, for Herr Wessely, a forest officer, has for some time been devoting close attention to a study of the sand drifts of Banat, as well as of those of Northern Germany, to which the former bear a strong resemblance. The result of his studies has been made known in a pamphlet, published in Vienna last year, in which work he enters fully into the general features and peculiarities of these sand drifts, their physical constitution, the climatic influences to which they are subject, the geological formations juxtaposed, and the vegetable growth most favoured by them, in which category are placed the poplar, the pine, fir and acacia. Herr Wessely's suggestions for gradually extending cultivation in these barren spots appear thoroughly practical, and it is anticipated that his efforts will prove successful.

M. WM. HEINE, who has returned to St. Petersburg after a lengthened stay in Japan, will shortly read a paper before the Imperial Geographical Society descriptive of his recent tour. He is also engaged in bringing out a large work on Japan, the most prominent feature of which is a collection of folio photographic views, which have been skilfully reproduced at Dresden from dry plates which the artist, M. Heine, took out with him.

The following communication, although it is of a nature rather to tantalize than to satisfy our readers, and although motives of delicacy determine us, contrary to an established practice, to suppress the name of its author, appears to us worthy of insertion:—

"THE FALL OF PRINCE FLORESTAN OF MONACO."

I SHOULD like to say a few words about this wag who has mystified the town at so much expense. I do not say but that I am mystified myself. When I first saw the advertisement—or placard, I call it—which filled a whole side of your own and the other weeklies, I naturally felt interested, familiar as I happen to be with Monaco

and its ways. For you must know, sir, though a young man, I have seen life. I had a Cambridge education, and went out in honours. But nature made a rover of me, and I am sorry to add, a gambler also. Even as an undergraduate I was no stranger to the unfortunate propensity; and for several years lately I have spent a good part of each season, sometimes winning and sometimes losing, at M. Blanc's establishment at Monte Carlo. So that, of course, I know everybody there and at Monaco. You are aware what a beautiful place it is, and how admirably things are conducted. But something happened at the end of last year which gave me a turn. I mean that affair of the Pole who shot himself on December 29—you will have observed the correspondence about it in the *Times*. The poor devil had been losing, and had only got up from beside me a minute or two when I heard a shot at my ear. I turned round, and there he was, half on the sofa and half off, groaning; the blood coming from a wound in his stomach; the crowd of players pushing round, whispering and gaping, while one young Englishman helped as well as he could, and the officials looked scandalised and did nothing. Of course the croupiers didn't leave their seats; their duty was to sit still until we recovered our spirits for the play, which happened in about fifteen minutes; only one or two women had gone out and didn't come back to their places. Next day the word had gone round to say, in answer to inquiries, that the man was an impostor, who had fired a blank cartridge at himself with a view to notice and a subscription; and that M. Blanc would certainly prosecute him. But every body knew better; the man had meant to blow his brains out honestly enough, though no doubt it would have been in better taste to make the attempt quietly at his hotel, or up among the olives. However, the accident bothered me so, and kept me awake so at night (I suppose my nerves must have been on the stretch already), that I determined to leave the place. So I came to London, and the next thing that reminded me of Monaco was this staring puff of Prince Florestan in the papers. What could the Messrs. Macmillan mean? Out of curiosity I bought the book as soon as it was to be had; and the fellow is so coolly on the spot in his remarks about real things and people, that for a moment I asked myself whether all he says might not actually have happened since I left. But I soon remembered how the Princess Florestine, whose son he represents himself to be, could have had no children older than ten, and how the little Prince Louis, whom he represents to have been thrown on to his head at the turn beyond Roquebrune, would have been only three and a half, instead of six as he says. Then of course I saw the hoax. Reading on, though I found out several more slips, I could feel how smart the thing was; but what I couldn't for my life make out was, who could possibly have written it, nor what on earth he could have written it for. So I turned to the papers for information, and they didn't help me much. The *Daily News* appeared to take it in earnest; the *Telegraph* made sure it was Mr. Matthew Arnold, and (as Mr. Matthew Arnold had often poked his fun at the *Telegraph*) was inclined to think it a joke, and a poor one; the *Saturday Review* declared it was sorry stuff, and as for being worthy of Arminius—the *Pall Mall Gazette* (Arminius's own organ) protested in two separate notices that, though not his doing, it was capital, especially the moral; the *Athenaeum*, whose proprietor is somewhat saucily treated by the author, couldn't see the point; even the *ACADEMY*, Sir, I found on this occasion less improving than usual. That is what gives me the courage, perhaps you will say the impudence—but remember, Sir, I am, in the words of Prince Florestan, “not a fool,” and have always managed to keep up my reading—to send you some notions of my own on the subject.

Well, then, I say the man who has played us this trick is a clever fellow. The *Saturday Review*

doesn't do him justice. He can be amusing without saying a word too much, and that, let me tell you, is a very rare thing indeed. His funny points are always made with adroitness and reserve. But it is in personalities that the writer is wittiest. The comparison, for instance, between M. Thiers and M. Blanc, to any one who has seen the two men, is exceedingly happy indeed. Then it always tickles and puzzles you to find some one knowing what you know yourself, and equally down upon M. Gambetta's family affairs and the dimensions of Mrs. Bischoffsheim's hall porter. Not but what he is wrong sometimes, as when he calls Lord Edmond Fitzmaurice a Communist; whereas I have heard the advanced representative of the borough of Calne execrate that movement as fiercely as any French banker of the Left Centre. And again, I don't think much of the Prince having got the names of the members of his council and staff all right—I mean Baron Imberty, Dr. Coulon, and the rest; he could easily do that out of the little *Monaco Guide*, published in 1872, which contains a complete directory of the population. And to say the truth, his satire gets rather tedious where these personages come in.

Now then, Sir, who is it that has had the face to deal in these cheery personalities for the public benefit? I like the sort of thing; but I don't know of any one else who does, unless it be Mr. George Trevelyan, who was fond of it when he was an undergraduate, or Mr. Matthew Arnold, who has manifested a weakness for it in riper years. But the author of the “Bear” was at Trinity, and wouldn't have made the mistake of sending his Prince into First Trinity Boat Club—to which, in my time at least, an Eton man would have tried in vain to be elected; besides, the manner is not Mr. Trevelyan's. As for Mr. Matthew Arnold, some of the hits have just his turn and trick. And as I had heard from a correspondent that the name of Arminius von Thunder-ten-Trönckh, whom we thought deceased, appears within these twelve months in the visitors' books of several hotels in those parts, I fancied at first that the *Telegraph* might have guessed right. Then it seemed so likely that the real case of the young Duke of Genoa might have suggested the imaginary one of the young Prince of Würtemberg. But on a second reading, though the English is generally good, I noticed one or two constructions of which the late Professor of Poetry at Oxford would never, even in disguise, have been guilty; and he would have done descriptions like those on pages 27 and 30 either better or not at all. Not to mention that I am told he denies the authorship. Meanwhile, the publishers keep their secret, and gossip says all sorts of absurd things. One well-informed person assured me positively that the author was one of our own Princes of the Blood, which would argue more talent in that family than is generally credited; and another, that it was Mr. Gladstone, which, as Prince Florestan is always lucid and concise, would show that a great man's literary style may improve suddenly in adversity. Then, I heard it was a Cambridge Professor of Fine Arts, whom I knew at Trinity, and saw myself in that neighbourhood before I came away; but rest assured, Sir, that he is incapable of anything so entertaining. To tell you the truth, I have fastened in my own mind upon a name which would be new to your readers, but which I must not in friendship disclose.

If, lastly, sir, you ask me what he wrote it for, I think it was chiefly for fun, and from high spirits. You see his mystification is not constructed with any continuous aim, and his satire of men and things is anything but well sustained. Of course he has had the late Ministry in his mind, off and on; and we all know what it means when Prince Florestan finds that he has disgusted his people with “going too fast” in the reform of army, church, and education: If there is one allusion steadily kept up, it is to the Education Act. But how indifferently the parallel is worked

out, even here. Prince Florestan, to have been like Mr. Forster, ought to have been supported by Dr. Coulon and an influential secularist party in Monaco; he ought to have deserted that party in order to please Père Pellico, and to have been deposed none the less by those to whom he had gone over. Then, this part of the squib might, perhaps, in the phrase of the *Pall Mall Gazette*, have “fulfilled the true functions of a political satire,” and have avoided the faults, which I venture to think it now commits, though the *Pall Mall Gazette* says not, of “passing out of relation with actual fact,” of “failing to apply to the politics of real life.”

Is it from a sense of having muddled his parallel that the author adds the postscript, in which he says that there is no moral to be drawn from his fall to the present state of English politics? or is that merely a part of the mystification? In any case, the postscript is the best-written part of the book, and the part that most reminds one of Mr. Matthew Arnold. To hit off the religious anarchy of England in that way, and to enjoy above all things the joke of calling Broad Church clergymen by their proper names, is so thoroughly in the manner of Arminius. Is it not, sir? So it is in his manner to “conjure his friends of the Radical party” in France to remember that “no system of government can be permanent which has for its opponents all the women in the country, and for supporters only half the men; and any party will have for opponents all the women which couples the religious question with the political and social, and raises the flag of materialism. Women are not likely to abandon the idea of a compensation in the next world for the usage which too many of them meet with in this.” That makes the *Pall Mall Gazette* as happy as possible; and, indeed, it is smartly said. But I should like to ask, Sir, is it the Radical party, or is it the party of reaction in France, that has coupled the religious question first of all with the social and political? Is it not the clerical party that seeks, in the name of religion, to insist on measures hostile to the social and political instincts of the population? Is it not clericalism, in its two chief representatives, M. de Falloux and Mgr. Dupanloup, which intrigues, and pulls wires, and embroils the politics of France at this moment; and whose helpless puppets are the “two stupid despots,” as Prince Florestan calls them—the Dukes of Magenta and Broglie? How, then, can Radicalism, how can Liberalism, avoid mixing up the religious question with the political and social, since the advocates and ministers of religion have already done so? And let me tell Prince Florestan and the *Pall Mall Gazette* that they are not quite right about the women either. Women in France, as well as other countries, are beginning to find out that the people who preach loudest to them about compensation in the next world are the very same who try hardest to prevent their getting justice in this. The priests have shown their wisdom in keeping tight hold of women's education hitherto, but the women are beginning to suspect them all the same. People argue as if women must to the end of time be of the same way of thinking as most of them have been hitherto. On the contrary, when women once take up an idea, they are uncommonly quick in following it out; and the women in France (where they manage the men more completely than in any other country) have lately taken up the idea that the Republic, which meant patriotism at the end of 1870, means order and economy now. I know something of Gambetta, as well as Prince Florestan; I came across him in the busy time three winters ago, and he never forgets anyone who was of use then. Well, it was only the other day he was telling me instances of the way women had come round to the Republic at that time, undeterred by “the flag of materialism,” in the heart of priest-ridden Brittany, in old-fashioned Poitiers, all over the country; and that in spite of the priests and the

reaction a greater and greater proportion of them were coming round to it every day. And mark my words, we shall see that it is true; we do see it by new rural majorities already.

But I beg your pardon, Sir: what business has a scapegrace like me to take up so much room in your learned columns? Only, I wanted to say that it seems to me your Prince Florestan, whoever he is—and whether or not I am right in my private conjectures as to his identity—might do better than this another time. He has spirits, wit, and a light hand—just the things English writers are most in want of, to my mind; let him make sure what he is driving at next time, and, if possible, let it be something worth the pains.

SELECTED BOOKS.

General Literature and Art.

- BELLARIS, E. Chembini: Memorials illustrative of his Life. Burns & Oates. 10s. 6d.
 CONTES populaires de la Russie, traduits par Loys Brueyre. Paris: Imp. A. Chaix et Cie. (Privately printed).

CORRESPONDENCE.

THE DISCOVERIES IN THE TROAD AND EGYPTIAN MONUMENTS.

Paris: March 17, 1874.

In my present letter I propose to compare the treasures of Dr. Schliemann with another series of objects. There are antiquities, of a fixed epoch, whose testimony none can reject, which show us the populations of Greece and of the coast of Asia Minor still in almost identically the same stage of civilisation as that disclosed by the treasures of Hissarlik. I refer to those inscriptions and bas-reliefs which, on the walls of the temples on the banks of the Nile, record the struggles of the Egyptians of the nineteenth and twentieth dynasties with the peoples of the isles and of the eastern coasts of the Mediterranean. Though attention was first called to these documents only six years ago by the lamented Vicomte de Rougé, they are now one of the chief studies of the Egyptologist; and M. Chabas has collected them all, with excellent translations and ingenious commentaries, in his recent work, entitled *Etudes sur l'Antiquité Historique, d'après les Sources Egyptiennes*. As M. Renan said, with reference to this book, "a curious phenomenon is just now taking place in criticism. Egypt will soon be a beacon in the midst of the deep night of high antiquity. The Egyptian texts are becoming the oldest documents for the ancient history of Hither Asia and the Mediterranean world."

I spoke in my former letter of the mention of the Dardanians, with their towns of Ilion and Pedasus, in the poem of Pentaur, which places them beside the Lycians, Mysians, and Carians, among the allies of the Hittites and the foes of Ramses II. Unfortunately, that document confines itself to quoting their names, without entering into further details. But we have fuller information on the subject of the war in which Mérenptah, son and successor of Ramses II., found himself involved at the beginning of his reign, and which for a moment placed Egypt in the most imminent danger. At the invitation of the Lebu (Libyans), who lived to the west of Egypt, on the sea-shore, and with whom they maintained habitual relations of commerce and navigation, the peoples of Greece and Southern Italy sent out bands of emigrants to disembark in the direction of Cyrenaica and Marmarica. Thus a large army was formed, composed of warriors of various confederate nations, which may be divided into two groups: the Libyan peoples, Lebu (Libyans in the strict sense), Mashuash (Maxyes), Kahuka, and their constant allies, the Shardana (Sardones), who were not yet perhaps, established in the isle to which they afterwards gave their name; and, secondly, the group of nations from beyond the sea, Akaiusha (Achaeans), Leku (the Laconians, or else the primitive Lycians of European Greece, traces of whom have been so ingeniously discovered by Professor Curtius), Tursha (Tyrrhenians), and Shekulsha (Siculi). Among the latter group the hegemony belonged to the Akaiusha, at least over the Leku and the Tursha, a fact of great importance, on which I shall have to insist immediately. Forming one host, the Libyan tribes and the warriors sent by the Pelasgic tribes of Italy and Greece, invaded Egypt on the north-west, carried their ravages far into the Delta, and penetrated to the town of Paarisheps (Prosopis), where they were finally crushed. Such is the tale which is to be read at Carnac, in a great monumental inscription contemporaneous with the events.

The vast and splendid pile of Medinet-Aboo is consecrated to the immortal glory of the exploits of another pharaoh, Ramses III., who lived about a century later. This monarch had, like Mérenptah, to fight against the Libyan nations, and the Pelasgic peoples of Italy, Greece and the islands, and of Asia Minor; but the two groups of populations were no longer acting in combination; they attacked the Egyptian empire independently, without concerted movements, and on different sides. I have nothing to do here with

the war against the Libyans. That against the people of the Eastern shores of the Mediterranean was remarkable as including engagements by both sea and land. Numerous nations took part in it: we find mentioned "the Pelesta of the mid sea" (the Pelasgi of Crete, ancestors of the Philistines), the Tékkri (Teucrians), the Daanau (Danai of Peloponnese), the Tursha (Tyrrhenians), the Uashasha (perhaps the Osci), and the Shekulsha (Siculi). The leadership belonged to two first named peoples, and it is expressly stated that all were drawn into the war by the Pelesta, who sought to get a footing in Syria, and so to form the settlement in that country which their descendants, the Philistines, actually possessed a century later on the coast of Palestine. A perfect army of emigrants, composed almost exclusively of Pelesta, taking with them their wives and children in cars drawn by oxen, and accompanied only by a small number of adventurers from other peoples, marched by land, and entered Syria on the north, the inhabitants not daring to refuse a passage to such a multitude. At the same time a large and well-fitted fleet attacked the coasts of Palestine; the ships belonged to the Pelesta, the Tékkri, and the Shekulsha; the Daanau, the Tursha, and the Uashasha furnished warriors only, who were distributed among the ships of the three other peoples. Ramses crushed the invaders who had come by land in the country of the Amorites; then he turned against those who were coming by sea. The pharaoh's fleet, which seems to have been manned by Phoenicians, destroyed the fleet of the Pelasgo-Philistines, Teucrians, and Siculi, a disaster which the Philistines, a century later, avenged by the destruction of Sidon. The great historic bas-reliefs of Medinet-Aboo represent the defeat of the Pelesta invader both by sea and land.

It is not difficult to find the trace of these events in Greek traditions, and, thanks to the help furnished by the positive data of Egyptian monuments, we are henceforth in possession of examples which allow us to estimate how large a historical element is mixed up with elements purely mythological in the primitive legends of Greece. When under Mérenptah we see the Achaeans and other inhabitants of the Peloponnese in intimate and coherent relations with the tribes of Libva, we cannot fail to recall the cycle of Libyan fables respecting Athene, Tritonis, the Libyan Poseidon, the passage of the Argonauts to Lake Triton, and the part which they play in the legends of Greece at a very early date. Above all, we cannot fail to notice the similarity between this landing of Achaeans and Pelasgi in the Cyrenaica or Marmarica, with their subsequent attack on the Eastern frontier of Egypt, and the tradition of a primitive establishment of Thessalian Pelasgi in Cyrenaica long before the Trojan war. This tradition presents itself, it is true, under an almost exclusively mythological form, inextricably bound up with the religious myth of the nymph Cyrene and her son Aristaeus. Hitherto, it was thought that it must have grown up, like the cycle of Libyan fables, at a time subsequent to the foundation of the Dorian colony of Cyrene by Battus. But we are now compelled to admit that it preserved the vague remembrance of those real historical events which are now disclosed by the Egyptian texts, and that Eusebius was right in assigning a place in his Chronicle to these first establishments of Pelasgi in the Cyrenaica, for which he doubtless consulted works now lost, which gave them a more historical character. It is to be remarked that the date under which he places them, 1333 B.C., is not far off the real epoch as given in Egyptian monuments.

Still more striking, as it seems to me, is the similarity to be established between the confederation which Ramses III. has to resist by sea and land, and the Cretan *thalassocratie*, to which the testimonies of Herodotus, Thucydides, Aristotle, and Strabo ascribe historical features, though it is attached to the purely mythical name of Minos, that is, of the Greek form of one of the

most ancient heroic conceptions of the Aryan race. In the confederation which attacks Ramses III., the "Philistines of the mid-sea," that is, the Pelasgi of Crete, have in the distinctest manner the hegemony; it is they who lead in their train the Danaï, the Tyrrhenians, the Oscans, and the Siculi. The possession of a navy gives them a decided supremacy over the isles of the Archipelago, the Peloponnese, and the south of Italy and Sicily; while the Teucrians of Asia Minor take part in the war on a footing of equality with the chiefs of the confederation. Now, what do Greek traditions tell us of this Cretan *thalassocratie*? Minos, having formed the first national fleet, subdues the Cyclades, and extends his hegemony over the whole of Greece. Cretan establishments of this epoch are mentioned on most of the isles of the Archipelago, and one is placed at Tenarus in Laconia. Minos, with his fleet, reduces part of Sicily, where he fights with the Sicani, the rivals of the Siculi, and founds Heraclæa, Minoa, and Engyon. In his time, and a little later, the Cretans rule over Iapygia, where they build Hyria, Brentesion, and Tarentum. His brother Rhadamanthys brings part of the coast of Asia Minor beneath his sceptre, together with the northern isles of the Archipelago. Lastly, his other brother, Sarpedon, founds an independent, but allied kingdom in Lycia, and a part of Caria and Ionia. Thus the *thalassocratie* set down in the Egyptian monuments as contemporary with Ramses II., and that ascribed to Minos by the Greek legend, have precisely the same centre, and embrace the same countries. It therefore seems to me very difficult to refuse to identify them.

If there is one fact of primitive history with regard to which there is a striking agreement in the traditions of Greece, it is assuredly the substitution of the dynasty of Danaus for the Pelasgic dynasty of Inachus and Phoroneus, three centuries before the Trojan war, and about 162 years before the coming of Pelops. I need hardly say that the history of Argos is exceptional in Greece, owing to the possession of a kind of chronology from a very remote epoch by means of the sacerdotal list. Now we have just seen that in the attack on Egypt which took place during the reign of Mérenptah, the hegemony over the invaders from Greece belonged to the Akaiusha, that is the Achæans, whom Dionysius of Halicarnassus, agreeing therein with Herodotus, identifies with the old Pelasgi of Argos. But in the events of the reign of Ramses III., the name of the Akaiusha does not figure, and their place is filled by the Daanau, whose name is manifestly that of *Δαναοί*. Thus the appellation of Daanau = *Δαναοί*, is substituted under Ramses III. for that of Akaiusha = *Ἀχαιοί*, to designate the inhabitants of the Peloponnese. The coincidence of this change with that produced by the substitution of the dynasty of Danaus for that of Inachus on the throne of Argos, is too striking to be attributed to mere chance. It seems to me that we shall have to draw from it a synchronism, which will furnish a secure basis for Aryan chronology, and that at the same time we may, in accordance with it, determine approximately the length of years which separate the country of the Pelopidae and the taking of Troy from the day when the images of the inhabitants of Greece, the isles, and the Troad were sculptured on the walls of Medinet-Abou.

The substitution of the name of Teucrians under Ramses III. for that of Dardanians, used under Ramses II., is as curious as the substitution of the name of Danaï for that of Achæans. In the traditional list of the Kings of Troy, Dardanus precedes Teucer, and Dardanus is at Troy before Danaus is established at Argos. It may thus be seen that Trojan recollections present as many points fully confirmed, and worthy of attentive consideration, as Aryan traditions. Critical history generally should give a share of its attention to the heroic genealogies of Greece; they preserve more than one real datum, and rightly to appreciate

their value, we have only to regard them from the right point of view. Most often they are of the same character as the ancient Arabian genealogies, and those contained in certain chapters of the Bible. The names given as those of individuals correspond to successive strata of population or to historical epochs.

It would be very curious to have figures of the Achæans who invaded Lower Egypt under Mérenptah; perhaps some day excavations in Egypt will yet bring some specimens to light. But now it is by an inscription only, accompanied by no bas-relief, that we know the event. This inscription, however, furnishes the detailed enumeration of the booty won from the Libyans, the Achæans, and their confederates, and the list gives us some idea of the habits and degree of civilisation of the vanquished. It includes vases of earthenware and metal, gold, silver, and bronze, in great numbers, women's ornaments, long daggers or short swords in bronze, bows and arrows, bucklers. In fact, it gives us almost an enumeration of the objects discovered by Dr. Schliemann, with this sole difference, (an important one it is true), that, of two modes of expression in Egyptian, one of which designates pure copper or bronze indifferently, while the other is exclusively reserved for bronze properly so called, the text in question uses the latter. This would incline us to believe that, in the time of Mérenptah, the Mediterranean populations had already passed from the age of pure copper, represented by the treasures of Dr. Schliemann, to the age of bronze, without any modification as yet in the outward appearance of their tools. I do not venture, however, to assign to the use of the word *bronze* a characteristic importance, which it perhaps did not possess from the pen of the Egyptian scribe. Lastly, in closing our remarks on the inscription of Carnac, let us notice one piece of booty which is not found in the treasures of Hissarlik, and must have been peculiar to the Achæans. On the battle-field of Prosopis, the Egyptian soldiers picked up a piece of defensive armour which they had never seen before. It had no name in their language, and, in enumerating the spoil, the scribe confined himself to drawing it. There is no possibility of mistaking what his picture represents; it is the *κνήμις*, or greave. So the Akaiusha, who attacked Egypt in the fifteenth century B.C., already deserved the epithet of *ἐκνήμιτες Ἀχαιοί*.

But they were not yet *καρηκομῶντες*. In fact, nothing like a plumed helmet appears in the costume of the Pelasgo-Philistines, the Teucrians, the Danaï, and the Tyrrhenians vanquished by Ramses III., who are represented as captives or in battle-pieces in so many parts of the palace of Medinet-Abou. Whether fighting on foot or on ship-board, all these populations are clothed, armed, and equipped alike. Their warriors wear a kind of stuff cuirass, or very light close coat, of a striped or chequered texture, without sleeves, and with simple shoulder-pieces, and beneath it a short tunic. Their offensive weapon is a straight, two-edged sword, with a short and broad blade, of the same shape as the copper daggers dug up by Dr. Schliemann, or the bronze dirks which occur in the oldest tombs of Cyprus. On the left arm they carry a round buckler of moderate size, held by two straps in a ring, into one of which the fore-arm is thrust, while the other, in the centre of the shield, is grasped in the hand. These arms and accoutrements are common to all the Pelasgic and Italiote peoples which I have just enumerated. The only distinction between them is in the head-dress. The Tyrrhenians wear a pointed cap or helmet, exactly similar to the Etruscan *tutulus*, and above all to the helmet which is seen on so many sculptured heads of Cypriote workmanship. Go to the British Museum, and see those statuettes of mottled terra-cotta in various colours, which are

* I am not speaking here of the Siculi, whose accoutrement is quite different, with horned helmet, lance, and larger buckler.

discovered in the most primitive tombs of Cyprus, and which do not testify to more than one single step in advance in the representation of the human figure beyond Dr. Schliemann's shapeless Trojan idols. The greater number represent a bearded warrior on horseback. Compare this with one of the plates in the great works of Champollion, Rosellini, or Lepsius, in which are reproduced the chiefs of the Tursha, or Tyrrhenian captives, as sculptured at Medinet-Abou, and you will be struck by their absolute identity. There is the same pointed beard, the same helmet, the same striped close coat, the same round buckler; we have before us, beyond all possible doubt, two representations of the same warriors, derived from two different sources, and agreeing precisely one with the other. I do not hesitate to apply the term *Pelasgic* to the statuettes in question, which characterise tombs of a special epoch at Cyprus, which represent the first rudiments of local art when it was still very rude, but exclusively native, and which, while perhaps a little later than the Hissarlik antiquities, are, like them, altogether free from all Assyrian or Egyptian influence.

In some of the Pelasgic terra-cottas of Cyprus, the horseman, while retaining the same cuirass of striped stuff, and the same round buckler, wears on his head, instead of the helmet or *tutulus*, a kind of cap or turban. This is precisely the slashed turban which is seen on certain Cypriote heads in calcareous stone belonging to the Lang collection in the British Museum, to the Cesnola collection, or to the series installed at the Museum of the Louvre by Comte de Vogüé, some of which heads bring us down in point of style to the very threshold of the period of that truly Greek art which was inaugurated by Evagoras. But it is none the less certainly the cap or stuff turban, with alternately coloured slashes, which forms the headdress of the Pelasgo-Philistines, the Teucrians, and the Danaï in the sculptures of Medinet-Abou. Thus the ancient costume common to the Pelasgic populations, abandoned everywhere but in Cyprus, had become at last a specially Cypriote costume, the costume which, curiously enough, Aeschylus, in his *Suppliants*, ascribes to the daughters of Danaus on their arrival at Argos:—

Κύπριος χαρακτήρ ' ἐν γυναικείois τύποις
Εἰκὼς πέπληται τεκτόνων πρὸς ἀρσένων,

and which, as he says, was much more nearly akin to that of the Libyan women than to that of the women of Greece:—

Λιβυστικαῖς γὰρ μᾶλλον ἐμπερίστεραι
Γυναιξίν ἴστε, κοῦδαμὼς ἔγχωριαις.

The only modification which we observe in comparing the bas-reliefs of Medinet-Abou with the sculptured heads of Cypriote workmanship, is that in the course of time the turban has been reduced in height.

Thus a strong similarity exists between the representation of the Pelasgic peoples of Greece, the isles and Asia Minor, at the end of the fourteenth century before our era, on the Egyptian monuments, and the figure on the earliest Cypriote antiquities, which latter, in their turn, have so many points of affinity with those discovered by Dr. Schliemann in the Troad. There are strange contrasts and inconsistencies in the semi-civilisation disclosed by the bas-reliefs of Medinet-Abou among the tribes of the Eastern Mediterranean, with whom Ramses III. fought. The heavy, solid-wheeled chariots of the Pelesta, drawn by oxen, belong to a still barbaric state; they are very far removed from the war-chariots of the Homeric poems. On the other hand, the construction and rigging of the ships of these same Pelesta and of the Teucrians indicate true nautical science. Briefly, the most striking point in this semi-civilisation is that it is purely native, free from the imprint of any foreign influence. The sculptures of Medinet-Abou leave upon the mind the impression of very nearly the same state of culture as the antiquities brought to light at Hissarlik.

Yet we have to ask ourselves whether the Teucrians, whose traces Dr. Schliemann has found, could have had ships as well made and equipped as those Teucrians, whose fleet was vanquished by the Egyptians on the coasts of Syria? But the shade of difference, if any, is inconsiderable; and even if we admitted that the representations of Medinet-Abou showed in the fourteenth century a certain advance on the earlier time to which the antiquities of Hissarlik must be referred, yet it would be a progress only very dimly perceptible, and in the same direction already followed by growing civilisation. The new evolution produced by the example of foreign and more highly civilised countries, which we are enabled to follow by so many antiquities in the Cyclades, at Cyprus, and at Rhodes, is not yet begun. The sculptured figures of Medinet-Abou determine the latest date at which we can allow the populations of Greece and the coasts of Asia Minor to be still free from any Egypto-phoenician or Assyrian influences, as the inhabitants of the Troad appear to be in Dr. Schliemann's antiquities.

But let us remark that, according to the synchronism which I have sought to establish with the traditional annals of Argos, the Teucrians vanquished by Ramses III. are more than two centuries earlier than the Trojan war; they are even earlier than the establishment of the Pelopidae in Greece. Now it is precisely in this interval that decisive changes and decisive progress, bearing the germ of many further stages of progress, took place in the civilisation of the countries situated on either side of the Aegean Sea. We have the proof of this fact in the remarkable monuments left by the Pelopidae at Mycenae and in the plain of Argos. These monuments furnish certain testimony of the nature of that civilisation, the point which it had reached, and its special characteristics, at the outbreak of the Trojan war. FRANÇOIS LENORMANT.

MR. FLEAY ON METRICAL TESTS.

Skipton Grammar School: March 21, 1874.

In to-day's ACADEMY I see that you have inserted a table* calculated from the metrical table in my first paper for the Shakspeare Society. It is calculated on the principle of taking all the long rhyming lines in each play, and dividing the number of blank verse lines by this total of rhymes. Now, my results were obtained by taking the rhyme lines in the *verse scenes* of each play, and dividing the number of blank verse lines by this number of rhyme lines, omitting all the rhymes that occur in scenes which are with their exception written entirely *in prose*. I think common sense declares distinctly that my method is the right one. Moreover, there are several plays that I have argued to be manifestly written by Shakspeare piecemeal at different periods of his life, viz., *Troilus and Cressida* (see ACADEMY, 14th inst.), *All's Well that Ends Well* and *Twelfth Night*; the separate parts of these plays of course require separate tabulation. *Macbeth* I hold to be a refashioning of Shakspeare's play by Middleton, which is also the belief of the Cambridge editors; and as to *Richard III.* I have most singular and hitherto unsuspected phenomena to disclose which will satisfactorily account for its place in the table. I subjoin the position of the plays by my rhyme test, which test I at present believe gives also the true chronological order. I have also to regret that I have through technical ignorance wrongly expressed myself as to my want of "opportunity of revising the proofs" mentioned in your issue of to-day. I have had a first proof of my first paper, but through temporary absence had only time to glance at it and correct obvious errors. A revised proof of the first, or any proof, of the second paper,

* In the heading to the figures of that table, read "1 to" for "1 in"; and in the remarks before it, read "Orlando" and "Rossind," for "Berownes" and "Rosaline."

I have not yet seen. I hope this explanation of my involuntary error will be satisfactory.

Proportion of Rhyme in Verse Scenes to Blank Verse.

F. G. FLEAY.

EARLY ENGLISH TEXT SOCIETY'S PUBLICATIONS.

Cambridge: March 24, 1874.

I read in the number of the ACADEMY for March 21, p. 311, the statement that the *Cursor Mundi*, when finished, "will be the largest book the Early English Text Society has undertaken, and will contain more comparative matter;" and that the *only books* to be compared with it are the six-text edition of the *Canterbury Tales* and the Wycliffite versions of the Bible.

I really think I may fairly put in a plea for the mention of my edition of *Piers the Plowman* amongst the books that contain a large amount of comparative matter. The three texts of that poem contain in all 17,161 lines. But, were that all, it would hardly be worth mentioning. The fact is, however, that, in addition to this, the foot-notes show the readings of sometimes *five*, sometimes *six*, sometimes even of *nine* MS., and that exhaustively. Taking six as a multiplier, the book contains at least 102,966 lines of "comparative matter," and this really represents hardly more than half the work, because many other MSS. were occasionally consulted, and the whole number of them examined was more than forty.

I should not have written this if it had not appeared to me that your readers might infer, wrongly as I believe, that the suppression of any reference to this work was intentional. I suppose it was a mere oversight, of no consequence to anyone but myself. I merely refer, as may be seen, to the quantity of the work. With regard to its quality, others can judge better than I can myself. All that I know about it is that most of the proof-sheets were read over fourteen times, and every pains taken to guard against even the minutest deviations from the originals.

WALTER W. SKELAT.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Mar. 28,	3 p.m.	Mr. Newton's third lecture on "Sphæras," at the Royal Institution.
	3.45 p.m.	Royal Botanic Society.

	"	Bach's <i>Passion</i> at Royal Albert Hall.

SCIENCE.

THE APPROACHING TRANSIT OF VENUS.

A RARE phenomenon of much interest to astronomers will take place before sunrise of December 8 next, on which occasion those who are fortunate enough to find themselves in Siberia, or the Antarctic continent, or in intermediate regions will, if the sky be clear, see the planet Venus pass obliquely upwards, from left to right, across the upper portion of the sun's disc, as a small black spot barely visible to the naked eye.* This planet revolves round the sun, in a nearly circular path within that of the earth, in rather less than eight thirteenths of a year, so that it will be between the sun and the earth once every 584 days, but owing to the tilt of the orbit of Venus with respect to that of the earth, it will usually pass a little to the north or a little to the south of the sun. If, however, the planet be at this time near the place where its orbit crosses that of the earth, it will pass directly between us and the sun, and what is called a transit will take place. Further, the same thing will happen after eight years, for both Venus and the earth will then be in nearly the same parts of their respective orbits; but there is this point to be noticed, that if Venus crosses the northern part of the sun's disc in the first case it will cross the southern part in the other, and conversely, for each time Venus catches up the earth a little sooner, so that after another eight years, they are so far off the crossing place of their orbits when they meet, that the tilt takes effect and throws Venus north or south of the sun.

The first transit of Venus was observed by Horrox (whose early death was a great loss to science) in 1639, and served only to establish the superiority of Kepler's tables, and to give the diameter of the planet with some approach to accuracy. Then followed transits in 1761 and 1769, the latter of which was well observed by parties of astronomers in widely distant parts of the globe, the famous Captain Cook being one of the number. It is from the observations then obtained that our knowledge of the sun's distance is in great part derived. The next pair of transits will be this year and in 1882,

* This refers to the northern hemisphere.

and there will then be no more till the year 2004. Now these phenomena afford us by far the most accurate means yet known of determining the distance of the sun, and thence the distances of all the planets. It is, therefore, of the greatest importance to secure good observations of such a rare event, but before we can decide on what are good observations, we must carefully consider how they are to be made available for determining the quantity sought.

It would appear that a misapprehension has arisen in the minds of some popular writers, who are not sufficiently acquainted with the method of reducing a large number of observations of one quantity, by which each measure is made to tell its own tale, and who have hence been led to insist rather too strongly on the value of isolated observations, and to infer that if these are not secured, the opportunity will be irretrievably lost. The general principle in all such cases is to make the most of the means at our disposal, which will be best done by occupying several favourable stations, instead of sending a single costly expedition, on what may turn out a wild-goose chase, to a point which might in the abstract be slightly preferable to some accessible places. It is to be feared that the popular way of treating questions of this kind does much harm, on account of its being convenient, for the sake of simplicity, to consider only extreme cases, a circumstance which naturally engenders a tendency to overlook unobtrusive mediocrity, even though it may really exercise the most important influence on the result. But it is time that we gave some explanation of the connection between a Transit of Venus and the distance of the sun. When two bodies at different distances are seen in the same straight line, the nearer appears to be shifted relatively to the other by a shift in the spectator's position, but in the opposite direction. If each body be removed to twice its distance from the spectator, thus keeping the distances in the same proportion, the amount of this shift will be halved, whilst if they be brought to half their original distances it will be doubled. If, then, the ratio of these distances be known, the amount of this shift or parallax displacement will enable us to determine both the distances. Now in the case of Venus and the sun, the ratio of the distances from the earth is known with the greatest accuracy by the help of Kepler's laws, which connect the distances and periods of revolution of the several planets. All that is necessary, therefore, in order to determine the distance of the sun and also of Venus, is to get a shift which is sufficiently large to be measured; and this is a matter of some difficulty, since we are confined to the earth and therefore cannot possibly shift our position by more than one ten thousandth part of the distance which separates us from the sun. The most accurate way of measuring the very small quantity we are dealing with is to refer it to the very slow motion of Venus, by noting at two stations widely apart the exact instant at which that planet is seen to enter wholly on the sun's disc or to begin to leave it.

In order that the parallax displacement may produce its greatest effect on this time of ingress, the shift must be perpendicular

to the sun's limb or edge where Venus enters, and therefore the two stations should be separated from each other in the direction of the line joining this point with the sun's centre. Now bearing in mind that the planet crosses the upper part of the sun's disc obliquely upwards, and that Australia is about in the centre of the hemisphere which is turned towards the sun at ingress, whilst the Indian Ocean occupies that position at egress some three hours and a half later, the best stations for ingress will be in the North Pacific and in the Southern Ocean, about 10 deg. due south of the Cape of Good Hope, and for egress in Siberia and on the Antarctic continent. The greatest shift will be produced when the sun is at opposite points of the horizon for the two stations; but as in that case we could not see the phenomenon well, on account of the low altitude of the sun, the stations must be so chosen that the sun is sufficiently high, and yet that the parallax displacement is considerable.

The quantity we have to measure is under the most favourable circumstances only 50 seconds of arc, a magnitude barely visible to the naked eye, and Venus moves over this space on the sun's disc in 25 minutes of time, so that an error of one or two seconds in the time observed is not of so much consequence.

It is necessary to bear this in mind in choosing between the two methods which have been proposed for solving the problem. So far we have considered the effect on the time of ingress at two places as separate from the effect on the time of egress, which is Delisle's method of treating the question; and this implies that we can compare our clocks at the two stations so as to know the difference of the two observed times. Now the only way of doing this for places not connected by telegraph is to set the clock to local time, and then to determine the difference between local and Greenwich time or the longitude of the place. But suppose we can find a station at which ingress will be accelerated and egress retarded, and therefore the duration of the whole transit lengthened, and another station at which exactly opposite effects will be produced, and the duration shortened; then it is evident that it is sufficient to observe these two durations without comparing the clocks, and this is the method which Halley proposed. This difference of durations is the result of two causes; in the first place, an observer at a northern station will see Venus further south, and therefore nearer the sun's centre, which will lengthen the path across the sun, and in the second place, the rotation of the earth will carry the station further to the east at egress, and will therefore apparently shift Venus to the west, and so hasten the egress. But this latter cause affects both northern and southern stations nearly alike in the transit of 1874, so that the effect of the first cause is left almost unaltered. Observations of difference of duration made in Siberia may then be compared with similar observations in the Southern Ocean, but the question remains whether this is the most advantageous way of treating the results; and a very delicate question it is, depending on a very nice estimate of the errors which are likely to occur in noting the time of

contact, and in determining the longitude respectively. The chances of weather also affect our choice materially, for, with Halley's method, everything is lost unless the sky is clear for both ingress and egress, and our choice of stations is naturally limited to those at which the whole transit is visible; objections which do not apply to the other plan. Besides, we must remember that the selection of Delisle's method does nothing to prejudice the use of the other, whilst it will be impossible to apply the former unless the stations are chosen with that view, and are equipped with suitable instruments for fixing the longitude. If this could be determined within a fraction of a second, there would be no doubt of the superiority of Delisle's method; and there would appear to be a good prospect of this happy consummation in the course of a few years, by means of the telegraph, at any rate for all the stations except Kerguelen's Island and Rodrigues. Those in Siberia will of course be in telegraphic communication. But in any case the longitude will be determined within about a second of time, which is, as was pointed out before, but a small quantity in comparison with the other errors to which we are liable.

Relying partly on the co-operation of other countries, the Astronomer Royal, Sir G. B. Airy, originally selected five stations suitable for the application of Delisle's method, to be occupied by the English, viz.: Honolulu to be compared with Kerguelen's Island and Rodrigues for ingress, and New Zealand and Kerguelen's Island to be compared with Alexandria (and the Russian stations) for egress; and no alteration has been made in these. But a new consideration has been introduced by the suggestion that photographs should be taken during the passage of the planet across the sun's disc, instead of confining our attention to what takes place at the limb, and in consequence of this a station will be selected in the north of India, at Mr. Proctor's suggestion, for securing photographs which can be advantageously compared with those taken at southern stations, the quantities to be compared being in this case the distances of the planet from the sun's centre, as measured on the photographs. The way in which these measures may be made available will readily be seen by considering that a comparison of the times when Venus is at the same distance from the sun's centre for two stations, is exactly analogous to a comparison of the times when the planet is at the distance of the sun's semi-diameter, i.e., on the sun's limb, the case which has been already considered. The Russian stations will naturally be in Siberia, but America, France, and Germany will occupy points near our own, the great difficulty being to find suitable islands in the hemisphere of water which is turned towards the sun at this transit. A glance at the map will at once show this.

With regard to the extensive preparations that have been made for observing the phenomenon, it will be desirable, in order to avoid confusion, to confine our attention to what is being done by our own Government, it being premised that other nations will adopt the same general plan. For observing

the ingress or egress, there will be altogether six large telescopes, mounted with clock-work, so as to follow the motion of the sun automatically, and about ten smaller telescopes, together with fifteen astronomical clocks, and some thirty chronometers. Then there are the instruments for determining time, and the latitude and longitude of each station, and last but not least, five photo-heliographs, which are nothing but astronomical telescopes, each carrying a camera with the usual lenses at the eye end, and having a snap arrangement adapted to give an exposure of a few thousandths of a second, which is amply sufficient for obtaining a complete picture of the sun, four inches in diameter.

Of course all these instruments must have huts to protect them from the weather, and as they are going to rather outlandish regions, these huts must be made here and taken out with the expeditions. They are so constructed that they can be taken to pieces and set up again in a few hours, and have such an arrangement of sliding shutters or revolving roofs that the instrument inside can command every part of the heavens. But it is of no use providing fine instruments unless we can get observers skilled in the use of them, and here there has been some difficulty. The supply of practical astronomers being decidedly limited, it was necessary to train men to the work, but some trouble was experienced in obtaining the raw material. Officers of the army and navy have, however, gallantly come forward, and they have been joined by several civilians, so that the tale is now nearly complete. But the training of more than twenty men in all the practical operations and theoretical computations required for the establishment of an observatory on a desert island would have been excessively difficult, but for the assistance that has been rendered by some of the officers who had a previous knowledge of such matters, and who devoted themselves to imparting that knowledge to others. In this way each observer has not only been thoroughly drilled in the sufficiently complicated astronomical observations and calculations required to fix his longitude, but has also learnt how to take the various huts to pieces and to set them up again, without misplacing even a single bolt. He has, besides this, taken photographs by the ordinary wet plate processes, and will shortly become equally proficient with dry plate photography, which has quite recently been adopted in preference to the older method by other nations as well as by the English.

The instruments belonging to each station are collected together and placed in their proper huts, and are as distinct from those of another party as though they were distant from them as many thousand miles as they now are yards.

In fact, each observer has rehearsed every part of the programme, including even the actual transit of Venus, for a model has been set up which, by means of clockwork, carries a black disc, representing Venus, across a sort of Gothic arch cut out in brass, which represents the two edges of the sun where Venus enters and leaves it, the intervening part being removed for the sake of con-

venience. Behind this arch is a looking-glass, which reflects direct sunlight (when we are indulged in such a luxury) to the spectator at a telescope some four hundred feet distant, who can thus watch the strange optical phenomena which are presented when a small black disc like Venus approaches the edge of a large bright disc like the sun. At such times a narrow black band or ligament is seen to dart out suddenly from the planet to the neighbouring limb of the sun, and it is the instant at which this occurs which the observer has to note. Anyone may see the appearance himself by holding his hand between the eye and a bright light, and making the forefinger and thumb gradually approach till the line of light between them disappears. It is hardly necessary to point out the importance to the observers of studying these phenomena before the critical time comes. But by way of supplementing this observation, a contrivance invented by Sir G. B. Airy many years ago, and known as a double image micrometer, will be made use of. This instrument gives two images of any object more or less overlapping, just as anyone can see double by pressing one of his eyeballs. Thus, when the contact is past at ingress, and Venus has got on to the sun's disc, one image of the planet may be brought back, as it were, to touch the second image of the sun's edge, reproducing in this way the original observation, and this may be repeated many times, both at ingress and egress, thereby adding much to the accuracy of the result. We can also by the same instrument find how far the planet has got on the sun before it has got clear of the edge, by measuring the length of the slice which is cut off the circular disc of Venus, for of course no part of the black planet is seen outside the sun's edge.

There remains to notice a plan which has been proposed by M. Janssen for taking in succession on different parts of the same plate, at intervals of a second, a number of small photographs of Venus and the neighbouring part of the sun's limb near the time of contact, so that the black ligament will be delineated in various stages, and the instant of its first formation determined precisely. There have been many practical difficulties encountered in carrying out this proposal, which presupposes the rotation of the collodion plate step by step, so as to expose different parts in successive seconds, but there is now every prospect of success in the application of this ingenious idea.

On the whole, we may safely predict that, if, in the highly improbable contingency of bad weather generally, the results of this transit do not justify our fondest expectations, we shall at any rate have accumulated such a stock of experience as will go far to ensure the success of that of 1882.

W. H. M. CHRISTIE.

The Fourth Report of the Royal Commission on Scientific Instruction and the Advancement of Science.

THIS new instalment of the Commission's labours contains a summary of the evidence which has been laid before the commission in the course of its existence, and some valuable suggestions for making the National Scientific Museums and

Collections more serviceable to the general body of students. The inquiry concerning the British Museum had reference almost entirely to the Natural History collections, and as these are about to be transferred to a new building now being erected for their reception at South Kensington, the Commissioners are of opinion that advantage should be taken of the removal to effect a change in the governing authority and official administration of this department. With this view they recommend the appointment of a director of the national collections of the Natural History Department, under the control of a minister of state, by whom keepers of collections and other scientific officers should be nominated to assist in the general work of such an establishment. It is also recommended that the Banksian Library should follow the botanical collections to South Kensington; on this point Mr. Carruthers said in his evidence before the Commissioners—

"The Banksian collection was in continual use while the Banksian Herbarium was being formed, and the volumes that form that library were annotated by the workers in the herbarium, so that if the books were left behind and the plants separated anywhere from the annotations on the books, the value of the plants in their cross references to books would be completely destroyed."

Respecting the Museum of the Royal College of Surgeons of England, founded in the last century by the celebrated John Hunter, the Commissioners report that since it came into the possession of the College it has been vastly extended and enriched, and is now probably the most complete and best arranged museum of its kind in existence. Should the fund at the disposal of the College, owing to changes in medical legislation, or from any other cause, prove inadequate for the efficient maintenance and continued extension of the museum, it is recommended that it should receive support from the state as an institution intimately connected with the progress of Biological Science in this country. At the same time, there seems to be no sufficient reason why it should, in such a case, pass from the custody and management of the College, under which it has so long and so greatly prospered.

The report next discusses the two institutions in or near the metropolis for the promotion of Botanical Science at present supported by the state—one lodged in the British Museum, the other at the Royal Gardens, Kew. From the date of its foundation, in 1755, the British Museum has contained a collection of dried plants; but Botany is said by the celebrated botanist, the late Mr. Robert Brown, to have been almost entirely neglected there, from the death of Dr. Solander, in 1782, until 1827, when the Botanical Collection was made into an independent department, and Brown himself appointed keeper of it. The present keeper considers the herbarium unequalled in the world, and has formed his opinion from the universal testimony of men having wide acquaintance with like collections in other countries; among eminent foreign botanists, who have visited the museum of late years, he mentions the names of Cosson, Baillon, Triana and Welwitsch. The Royal Gardens at Kew became public property in 1840, but were unprovided with any public herbarium or scientific library when Sir William Hooker took charge of them in that year. The important operations now carried on there will be best understood from a memorial, signed by many eminent scientific men, and presented to Mr. Gladstone in 1872. From this memorial we gather that:—

"In no particular does England stand more conspicuously superior to all other countries than in the possession of Kew. The establishment is not only without a rival, but there is no approach to rivalry as regards the extent, importance, or scientific results of its operations. Upwards of 130 volumes on all branches of botany, including a most important series of Colonial Floras, but excluding many weighty contributions to scientific societies and journals, have issued from Kew."

During the ten years, from 1863 to 1872 inclusive, the number of living plants sent from here to various parts of the world has been doubled, amounting on an average to 8,000 or 9,000 annually. Of seeds ripened at Kew, or obtained by the Director from various parts of the world, the annual average distributed amounts to about 7,000. Of the practical value of these labours, the introduction of the cinchona plant into India, Ceylon, and Jamaica, the commercial success of which is established, constitutes one of many illustrations: the introduction of ipecacuanha is another. In India upwards of thirty gardeners, trained at Kew, are now employed in forestry, cotton, tea, and cinchona plantation, Government gardens, &c., and a far greater number are usefully employed in other parts of the world.

The evidence laid before the Commissioners amply justifies them in the recommendation that these two botanical collections, the maintenance of neither of which involves any considerable cost, should not be merged into one, but that both be kept in a state of efficiency, and that the special scientific direction which each has spontaneously taken should be retained.

The primary object of the Museum of Practical Geology is defined in this report to be the exhibition of the industrial applications of geology and the kindred sciences, with special reference to the mineral resources of this country and its dependencies; and the collection of British fossils and rock specimens, illustrating the Geological Survey of Great Britain. The collection of minerals here is evidently closely allied to the Mineralogical collections of the British Museum, which it is proposed shall hereafter find a place in the New Natural History Museum; and the Commissioners quote Professor Story-Maskelyne's opinion that the Museum of Practical Geology is the best and most practical destination for the entire series in the event of any change being made in the distribution of the collection, but give a number of reasons—a sufficient one being an entire lack of accommodation in Jermyn Street for such a transfer—for not basing any recommendation upon it.

An analysis of the facilities afforded to scientific instruction at the South Kensington Museum next follows, which concludes with some proposed additions to the scientific collections there.

"While it is a matter of congratulation," write the Commissioners, "that the British Museum contains one of the finest and largest collections in existence illustrative of Biological Science, it is to be regretted that there is at present no national collection of the instruments used in the investigation of mechanical, chemical, or physical laws." And again: "The daily increasing demand for knowledge concerning these sciences makes it desirable that the National Collections should be extended in this direction, so as to meet a great scientific requirement which cannot be provided for in any other way.

"The defect in our collections to which we have referred is, indeed, already keenly felt by teachers of science. If a teacher of any branch of Experimental science wishes to inspect any physical instrument not in his possession, as a teacher of literature would a book, or a teacher of biology would a specimen, there is no place in the country where he can do it."

This state of affairs presents a marked contrast to the system adopted in many continental towns, where collections of scientific apparatus, combined with lectures accessible to workmen, have exerted a very beneficial influence on the development of the skill of artisans employed in making such instruments. The Commissioners accordingly recommend the formation of a collection of physical and mechanical instruments; and that this collection, the collection of the Patent Museum, and of the Scientific and Educational Department of the South Kensington Museum should be united and placed under the authority of a minister of state.

After a brief account of the scientific collections in Edinburgh and Dublin, and of local museums in various parts of the United Kingdom, the Commissioners recommend the establishment of similar

institutions in all great towns, and that such establishments, as well as the maintenance and improvement of those which have already been formed, should be promoted by aid from the State. The report concludes with a variety of valuable suggestions with regard to the delivery of public lectures in connection with the principal museums throughout the country.

The importance of the opinions and recommendations which we have here endeavoured briefly to set forth is sufficiently guaranteed by the signatures attached to this report, which are those of the Duke of Devonshire, Sir John Lubbock, Sir J. P. Kay-Shuttleworth, Professors Huxley, H. J. S. Smith, and Stokes, Drs. Sharpey and W. A. Miller, and Mr. Bernhard Samuelson.

NOTES AND NEWS.

THE *Nation* states that almost from the very beginning of its establishment, the Smithsonian Institution has been engaged in the prosecution of a very elaborate system of meteorological research, embracing, at one time and another, more than a thousand stations in the United States, with a large number in the British Provinces and in the territory south of our own boundaries. This has been in successful operation during a period covering a full quarter of a century, and a vast amount of important information has been accumulated, the results of which have been elaborated in important memoirs on the climatology of North America. Of these, one on the rain-fall has already been published, while those on the winds and temperatures are nearly ready for the press. The rapid development of the meteorological system initiated by the Signal Service Office, in connection with the department of weather telegraphy, has induced Professor Henry to turn over to the War Department the system of observations belonging to the Smithsonian Institution; and, under an agreement to that effect, a circular has lately been issued by Professor Henry requesting all the former correspondents of the Institution to continue their observations, and to transmit them to the Signal Office, which promises the accustomed return in the way of meteorological publications and other service. All the necessary blanks will be issued as heretofore, and the only changes will probably be in the line of increased efficiency and precision.

PROFESSOR PALMIERI has written to the editor of the *Naples Gazette* to warn strangers, who propose to make the ascent of Mount Vesuvius, that various changes have occurred within the present year in the physical configuration of the crater which render it impossible to follow the old tracks. He announces that, within the last fortnight, a further change has taken place; and that the cyclopean wall, which had been thrown up around the deep and wide crater remaining after the destructive eruption of April 26, 1872, has fallen in, while the old crater has been filled up without having exhibited any signs of volcanic activity. Professor Palmieri considers it a question open to discussion whether this filling up of the crater may not be due to an upheaval of the surface below, rather than to the presence of *débris* from the broken-down walls of the basin. The early season of the year and the density of the surrounding smoke preclude the possibility of making continuous observations to solve the problem, which, moreover, involves very important considerations, since, if the existing phenomena be due to upheaval, their occurrence indicates an active condition of volcanic force, which excites fears for the future; while, if they are simply the result of the disintegration and falling in of the walls, which consisted of thin layers of scoriae intermingled with large masses of compact lava, the occurrence is of no special importance. Travellers are informed that they cannot approach the crater by the old path, and that it will be

necessary for them to keep to the north-west of the wall, where a deep fissure, formed in the eruption of 1872, will afford them access to the only spot from which they will command a view of the crater.

DR. MORIZ VON JACOBI, the inventor of the Galvanoplastic method, died at St. Petersburg on March 10, at the age of seventy.

WE learn from the German papers that the Bavarian Government has made arrangements with Dr. Dohrn, the director of the great International Zoological Station at Naples, for the reception in the Aquarium-Laboratory of a student to prosecute the study of marine zoology, algology, &c. These zoological scholarships are open to members of the three Bavarian Universities, but may, under definite conditions, be awarded to non-academical candidates who shall satisfy the prescribed requirements. They are to be held for a year, and the first election will be made on March 30, at the University of Munich, when drawing on the blackboard will be included in the subjects required from the candidate.

THE General Report on the operations of the Great Trigonometrical Survey of India during 1872-73 contains a very full account of the progress of this most important undertaking. Colonel Walker, the superintendent, has added some very interesting notes on the maps of Central Asia and Turkestan, compiled and published in the office of the Survey, from which it appears that until the last year or two our knowledge of the geography of these regions was mainly derived from the maps which were compiled in 1711 by the French Jesuits in the service of the Emperor of China. In 1864 Colonel Walker proceeded to St. Petersburg, and obtained in Russia the principal portion of the information that enabled him to compile his maps. Valuable maps, which have not found their way to England, are preserved at the Topographical Department of the Russian War Office and among the archives of the Russian Geographical Society, to both of which offices Colonel Walker obtained free access.

PROFESSOR MILNE-EDWARDS has recently contributed to the French Academy (see *Comptes Rendus* for December 29, 1873) the result of a series of investigations on the colour of birds as connected with their geographical distribution. His first series of observations were devoted especially to the phenomena of melanism in its various degrees. Birds with black plumage are found in almost all parts of the world; but in certain widely distributed families the tendency to melanism is displayed only in the southern hemisphere, and especially in the oceanic district including New Zealand, New Guinea, Madagascar, and the intermediate islands. This is remarkably illustrated in the family of swans, which has a number of representatives in the northern hemispheres, all perfectly white; while in the southern hemisphere there are only three species, of which one, that of New Holland, is perfectly black, while of the two others, natives of South America, one has a few black feathers, the other a black head and neck, the rest of the body being white. A number of other families illustrate also the same law.

It is now nearly fifteen months since H.M.S. *Challenger* left England on her voyage round the world, and the Admiralty have lately printed some extracts from the reports of her Commander, Captain Nares, for the year 1873, which give us official information of her movements during a portion of that time. The first report is dated from Gibraltar, January 18, and the last from Simon's Bay, December 15. The information here given as to the temperature of the water in the Atlantic, and the details of the various soundings, are very interesting, and their value is increased by the addition of a series of coloured diagrams, representing sections of the North and South

Atlantic Oceans, which discover to the eye in a very vivid manner the remarkable inequalities at the bottom of the sea.

THE March number of the *Annals and Magazine of Natural History* contains an interesting communication, in which the disputed question of the animal structure of the so-called *Eozoon canadense* is re-opened. Mr. H. J. Carter, F.R.S., than whom none can speak with greater authority on any question touching the Foraminifera, after carefully examining a specimen of the *Eozoon* under the microscope, "most unhesitatingly declares that it presents no foraminiferous structure anywhere."

THE Indian Government have lately published a valuable Report, by Dr. Douglas Cunningham, on the solid bodies present in the atmosphere of Calcutta and its neighbourhood, from microscopical examinations of the air made in 1872. The author reviews the literature of atmospheric micrography, from Ehrenberg's experiments in 1830, to Mr. Blackley's experiments on pollen in 1873, and it appears that his results agree very closely with those of M. Robin, and differ almost equally from those arrived at by Pouchet and Ehrenberg. The Report is illustrated by fourteen coloured plates of atmospheric organisms.

THE volume of Astronomical and Meteorological Observations, made at the United States Naval Observatory in Washington in 1871, which has lately been published, is the thickest volume yet issued by that valuable institution. It contains a memoir of the Founding and Progress of the Observatory, by Professor J. E. Nourse.

M. A. DASTRE contributes to the *Revue des Deux Mondes* of March 15, an article on "L'Alcoolisme et l'Absinthisme," which he but too justly calls the scourge of our time. The first knowledge of alcohol is attributed to Arnaud de Villeneuve, physician to Peter III. of Aragon, about the year 1280, but he doubtless learned it in Spain from the Arabian physicians, who had discovered it in the course of their experiments in alchemy. He became the historian of this *aqua vini* or *aqua vitæ*, and ascribed to it, among other marvellous virtues, that of curing most maladies, "of staying the advance of age, and of nourishing youth." Hence the name, which it has so ill justified, of *eau-de-vie*. Alcohol attained popularity but slowly in France and throughout Europe generally. Till the beginning of the sixteenth century, it was nothing but a pharmaceutical potion, the preparation of which was the monopoly of the apothecaries, who shared their privilege in 1514 with the corporation of the vinegar-makers, which in its turn gave rise to the corporation of distillers. Distilleries multiplied but slowly, and their produce was chiefly for exportation; the most famous in the seventeenth century were those of Nantes and Strasbourg, and England was their best customer. Some liqueurs, however, were in great demand in France; Louis XIV. himself was especially fond of *rossoli*, while the courtiers and middle classes preferred *ratifia*. On the whole, *eau-de-vie* was not taken in excess before the beginning of the eighteenth century, and its abuse in all countries has been in very great measure due to foreign war. Thus the English soldiers developed a taste for "brandwine," or burnt wine, during their campaigns in the Low Countries in the sixteenth century, which have had also, since Uncle Toby, the reputation of teaching them the art of swearing. In the United States drunkenness is said to be the legacy of the War of Independence; in France, the wars of the Empire produced a like result, and the fatal passion for absinthe was brought by the French troops from Africa. Every lover of France will be rejoiced to hear that in the first year after the law of 1872 came into operation, by which a heavy excise was imposed on absinthe, the consumption of that liqueur in Paris has diminished almost fifty per cent.

THE *Eugubine Tables* have recently been the object of the studies of M. Michel Bréal, the result of which he has begun to communicate to the Académie des Inscriptions. These tablets of bronze, in the Umbrian language, containing the acts of a corporation of priests established at Iguvium (now Gubbio, about 100 miles due north of Rome, in the late Papal States), whose authority seems to have extended over a considerable district round, were, as is well known, discovered at that town in 1444. According to Antonio Concioli, who devoted himself to their history in the seventeenth century, they were originally nine in number; but in 1540 two of them were removed to the Arsenal at Venice, where all trace of them was subsequently lost. It is hoped that they may still exist in some of the Venetian palaces, and M. Bréal asks that the Italian Government should direct a search to be made for them. The text of the remaining seven—the older portion of which is in an alphabet borrowed from Etruria, the more recent in Roman characters—was published as early as 1723, in the work of Dempster, *De Etruria Regali*. It was not, however, till the present century that any successful attempt was made at deciphering them, and the credit of reading them is chiefly due to Aufrecht and Kirchhoff in their *Umbriſche Denkmäler* (1849-51). Notwithstanding the diligence of these scholars there still remain various obscurities, grammatical and lexical, on which M. Bréal promises to throw fresh light. The complete decipherment of the inscriptions is a matter of equal interest to philology and to classical archaeology.

THE death is announced, at the early age of forty-nine, of Louis-Francis Meunier, a distinguished French philologist.

DR. W. L. VAN HELTEN, one of the ablest of Dutch philologists, has issued a small brochure, written in German, and bearing the title: *Finfzig Bemerkungen zum Grimm'schen Wörterbuche*.

PROFESSOR BARTSCH, the famous Old-French and Provençal scholar of Germany, arrived in London on Thursday. He will shortly start for Cheltenham, to see the Old French and Provençal MSS. in the late Sir Thomas Phillipps's collection, now owned by his daughter, Mrs. Fenwick, and her husband, as tenants for life.

M. GASTON PARIS reached London on Monday, and has been studying the Old French MSS. in the British Museum. He will be joined on April 1 by M. Paul Meyer, and both scholars will then go to Cambridge to examine the Old French MSS. in the libraries of the University, Trinity and Corpus.

MEETINGS OF SOCIETIES.

LINNEAN SOCIETY (March 19).

SIR JOHN LUBBOCK read an interesting paper on wasps and bees. He commenced by pointing out that with reference to the power of communication with one another, possessed by Hymenoptera, the observations on record scarcely justify the conclusions which have been drawn from them.

In support of the opinion that ants, bees, and wasps possess a true language, it is usually stated that if one bee discovers a store of honey, the others are soon aware of the fact.

This, however, does not necessarily imply the possession of any power of describing localities, or anything which could correctly be called a language. If the bees or wasps merely follow their fortunate companions, the matter is simple enough. If, on the contrary, the others are sent, the case would be very different. In order to test this, Sir John kept honey in a given place for some time, in order to satisfy himself that it would not readily be found by the bees, and then, after bringing a bee to the honey, watched whether it brought others or sent them—the latter, of course, implying a much higher order of intelligence and power of communication.

In the first place, then, he kept some honey for

some days at an open window in his sitting-room, and no bees came to it. He then brought a bee up from his hives in the garden in his hand, choosing one which was in the act of leaving the hive. He found it frightened the bees less to be brought in the hand than in a bottle, probably on account of the darkness. The bee thus brought up was then fed with honey, which it sucked with evident enjoyment for a few minutes, and then flew quietly away. But though it had given no symptom of alarm or annoyance, it did not return, nor did any other bee come to the honey. This experiment he repeated eight times, with a like result. He therefore procured one of Marriott's observatory hives, which he placed in his sitting-room. The bees had free access to the open air, but there was also a small side, or postern door, which could be opened at pleasure, and which led into the room.

This enabled him to feed and mark any particular bees, and he recounted a number of experiments from which it appeared that comparatively few bees found their own way through the postern, while of those which did so, the great majority flew to the window, and scarcely any found the honey for themselves.

Those, on the contrary, which were taken to the honey, passed backwards and forwards between it and the hive, making, on an average, five journeys in the hour. In these cases it is obvious that the bees which had found the honey did not communicate their discovery to the others; and the postern being small and on one side, few of the bees found it out for themselves.

Sir John had, also, in a similar manner, watched a number of marked wasps with very similar results.

No doubt, when one wasp has discovered and is visiting a supply of syrup, others are apt to come too, but he believed that they merely follow one another. He argued, that if they communicated the fact, considerable numbers would at once make their appearance, but he has never found this to be the case. The frequent and regular visits which his wasps paid to the honey put out for them, prove that it was very much to their taste. Yet they did not bring their companions with them. For instance, on September 19, when a marked wasp paid more than forty visits to some honey, only one other specimen came during the whole day to the honey. Both these wasps returned on the 20th, but not one other. The 21st was a hot day, and there were many wasps about the house; his honey was regularly visited by the marked wasps, but during the whole day only five others came to it.

From these and other observations of the same tendency, he concludes, that even if bees and wasps have the power of informing one another when they discover a store of good food, at any rate they do not habitually do so, and this seemed to him a strong reason for concluding that they are not in the habit of communicating facts. If they do not, he argues, discuss among themselves the incidents of the day, adventures in search of food, their success and fortunes in hunting, is it not a fair inference that they have no power of doing so?

When once wasps had made themselves thoroughly acquainted with their way, their movements were most regular. They spent three minutes supplying themselves with honey, and then flew straight to the nest, returning after an interval of about ten minutes, and thus making, like the bees, about five journeys an hour. During September they began in the morning at about six o'clock, and later when the mornings began to get cold, and continued to work without intermission till dusk. They made, therefore, rather more than fifty journeys in the day. In fact, they were just as industrious as bees, and kept longer hours, as they began earlier in the morning. He believed that the wasps which seemed to be idling in our rooms had simply lost their way. He gave also a number of observations

tending to show the difficulty which bees have in finding their way. For instance, he put a bee into a bell-glass 18 inches long, with a mouth $\frac{6}{8}$ inches in diameter, turning the closed end to the window. The bee buzzed about for an hour, when, as there seemed no chance of her getting out, he released her.

Although, as everyone knows, wasps are easily startled and very much on the alert, still they are very courageous.

On one occasion one of his marked wasps had smeared herself with honey and could not fly. As he did not know exactly where her nest was, he was afraid she was doomed. He thought, however, that he would wash her, fully expecting, indeed, to terrify her so much that she would not return again. He therefore caught her, put her in a bottle half full of water, and shook her up and down well till the honey was washed off. He then transferred her to a dry bottle and put her in the sun. When she was dry he let her out, and she at once flew to her nest. To his surprise, in thirteen minutes she returned as if nothing had happened, and continued her visits to the honey all the afternoon.

He also had made some experiments on the behaviour of bees introduced into strange hives, which seemed to contradict the ordinary statement that strange bees are always recognised and attacked.

Another point as to which very different opinions have obtained currency is the use of the antennae. Some entomologists have regarded them as olfactory organs, some as ears; the weight of authority being perhaps in favour of the latter opinion. In experimenting on his wasps and bees, Sir John, to his surprise, could obtain no evidence that they heard at all. He tried them with a shrill pipe, with a whistle, with the violin, with all the sounds of which his voice was capable, doing so, moreover, within a few inches of their head; but they continued to feed without the slightest appearance of consciousness.

Lastly, he recounted some observations showing that bees have the power of distinguishing colours. The relations of insects to flowers imply that the former can distinguish colour, but there had been as yet but few direct observations on the point.

ROYAL GEOGRAPHICAL SOCIETY.

At the Royal Geographical Society's meeting on Monday evening, the secretary read a most interesting letter from Mr. Forsyth, the head of the English Mission to the Atalikh Ghazi, or ruler of Eastern Turkestan. The Mission had left Yarkund on November 28, and after finding good quarters provided at every station on the road, they had finally reached Kashgar, the capital of the Amir (as the Atalikh now calls himself) on December 3. Here a large house with most comfortable accommodation had been specially built for the party, and wood fires burned in every room. Mr. Forsyth's room was actually hung with velvet. They found that they had been anticipated in the matter of trade, for goods with the Russian trade mark, which had come from Moscow *via* Tashkend, were everywhere to be seen in the bazaars. Still, if English merchants would but be content with profits somewhat under 50 per cent., there was a reasonable hope of success. The Amir was going to issue a silver coinage, with the Sultan's head on one side, and his own on the other. The Mission would probably accompany the Amir to Aksu, and Captain Trotter, the surveyor of the party, did not despair of floating his canoe on the distant Lake Lob Nor. In consequence of the friendly relations subsisting between the Amir Yakub Khan and the Amir of Cabul, Mr. Forsyth expected to be able to return by the Pamir Steppe, and thus to solve the geography of that interesting region.

Mr. Watson, chargé d'affaires at the British Legation at Yeddo, then read a paper on the Island of Yezo, the northernmost of the Japan group. According to the official reports, which, however, are

not very trustworthy, Yezo has only 124,000 inhabitants to an area of country greater than that of Ireland. The Japanese rulers have been impressed with the necessity of devoting attention to its colonisation, for fear that their irrepressible neighbours, the Russians, who have already taken possession of the greater part of the large island of Saghalin to the north, might make neglect of Yezo by Japan a plea for its seizure by Russia. Yezo is excessively rich in timber, but through the timid policy of its rulers there is no scope for commercial enterprise in this direction, for the island, with the exception of the port of Hakodati and its neighbourhood, is closed to foreigners. Salmon, too, is very plentiful, and an English merchant resident at Hakodati informed Mr. Watson that with government encouragement this might prove a most flourishing branch of commerce, as well as yield a good revenue. At present the attempt to raise a tax from the fisheries was a farce—in the words of an American officer, "there was an official for every fish caught." The coast of Yezo had been surveyed by Captain St. John, of H.M.S. *Sylvia*, and a systematic exploration of the country and investigation into its resources was being conducted by a commission of American officers in the employ of the Japan Government.

SOCIETY OF ARTS (Wednesday, March 25).

MR. HAWES read a paper on the "Channel Tunnel." The author stated that in the trial of a machine, invented by Mr. Brunton, for tunnelling through chalk, recently made near Maidstone, a heading seven feet in diameter was driven at the rate of three feet per hour. By the aid of this machine, making due allowance for casualties, a driftway could be driven under the Channel in two years and a half, the work being carried on from the two ends simultaneously. From careful calculations, the cost of such a driftway was estimated at 1,000,000*l.* The author estimated that the entire tunnel could be completed in a period of from five to six years, and at a cost of about ten millions sterling. The number of passengers passing annually between this country and the continent is at present about 450,000; with the increased facilities for traffic afforded by the tunnel, this number would probably be increased four or five-fold. Taking the number at 2,000,000, at the average fare of 8*s.* 6*d.* each, the return for passenger traffic would amount to 850,000*l.* per annum; adding to this 300,000*l.* for carriage of merchandise, and 20,000*l.* for mails, parcels, &c., 1,170,000*l.* would be the gross annual income. If 40 per cent. be subtracted for working expenses, a net revenue of 702,000*l.* remains, which would be sufficient to pay interest on the original cost of 10,000,000*l.*, at the rate of 7 per cent.

THE ROYAL SOCIETY (Thursday, March 26).

ON the Organisation of the Fossil Plants of the Coal Measures. Part VI., Ferns. By Professor W. C. Williamson, F.R.S.

Dr. Huggins communicated a paper on the Motions of some of the Nebulae towards or from the Earth: though the results at which he has arrived, after some years' work, are merely negative. The nebulae may be divided broadly into two classes:—clusters of small stars requiring a very powerful telescope to distinguish the individual components, and masses of rarefied gas, exhibiting a spectrum consisting of three or perhaps four bright lines, characteristic of incandescent hydrogen, and of some other element not yet discovered. It is the latter class of bodies which Dr. Huggins has examined with the view of detecting a displacement of the lines in the spectrum arising from motion in the nebula to or from the spectator. The most troublesome part of the process was the discovery of a good line of some terrestrial substance in the green with which the

brightest line in the nebulae could be compared, for the hydrogen lines are too faint for accurate measures. The search for this standard has led to an interesting discovery, though we are hardly as yet in a position to understand its full significance. In the first instance a line of nitrogen, which is double, was compared with the line of the nebulae, but afterwards, Dr. Huggins found a line in the spectrum of lead, which answered his purpose better; and from the fact that he was unable to detect any shift relatively to this line, he concludes that none of the nebulae examined have a motion exceeding some twenty-five miles a second. Now, there seems to be some curious connection between the line seen in the spectrum of lead and the double line of nitrogen, by virtue of which the one appears when the other disappears, and this suggested the idea that perhaps, after all, the line in question was really due to an allotropic form of nitrogen. This was at once negatived by taking the spark in an atmosphere of hydrogen; for if nitrogen were the *vera causa*, the line must have had its origin in the particles of air heated by the electric discharge between the lead electrodes. It is certainly very curious that when the electrodes are far apart and a Leyden jar is used, this line should be quite obliterated by the double lines of nitrogen, whilst the other lead lines are well seen, and that when the electrodes are close together this should be the only line visible in the spectrum. We shall look forward with much interest to further researches by Dr. Huggins on this subject.

On the Annual Variation of the Magnetic Declination. By J. A. Brown, F.R.S.

FINE ART.

HISTORY OF FINE ART IN SWITZERLAND.

Geschichte der Bildenden Künste in der Schweiz. Von Dr. J. Rudolph Rahn. Erster Band, erste Abtheilung. 8vo. (Zürich, 1873.)

As a native of Switzerland and teacher of art-history at the University of Zürich, Dr. Rahn has been naturally ambitious of producing a book which should give a true picture of architecture, sculpture and painting in his native country; and no person is more competent for this task than a professor who, besides being a worthy disciple of the school of Schnaase, has written a learned and attractive account of the monuments of Ravenna, by which his right to be heard anywhere in matters appertaining to art and archaeology is firmly established. A great disadvantage under which any one must labour in treating the subject taken up by Dr. Rahn is, that Swiss art, properly speaking, does not exist. No amount of literary skill can compensate the defect arising from this, that Switzerland before it became independent was a conglomerate of parts adhering politically and materially to other nations; and no treatment can conceal the fact that artistic remains in Switzerland bear a German, Italian or French impress according as they have their origin near the northern, southern, or western limits of the country. Dr. Rahn has published as yet but an instalment of his history, comprising the periods which separate the prehistoric from the Romanesque. From the very beginning he has had occasion to observe that States may federate, but that Art keeps its own peculiar way notwithstanding. He deals with imported products

in the age of the Romans, with imitations of Roman and Byzantine works under the Allemanns and Burgundians, with Italian influences under the Carolingians, with Irish and barbaric feeling amongst the miniaturists of Benedictine convents. He severs, in fact, from general history that portion of it which illustrates Switzerland, and achieves nothing more than that he cuts a section out of the larger and more universal work already performed by Kugler, Schnaase, and others. Giving his book, however, the more defined outline and the more elaborate detail which such a sectional work requires, Dr. Rahn still makes it interesting, and we may follow with advantage not only his accounts of early buildings and ornament, but his copious and instructive description of the convent of St. Gall, the earlier portions of which seem hard to restore if we look at the edifice in its present state, but are easily reconstructed with the help of a complete plan, which Dr. Rahn agrees with earlier critics in assigning to the year 820. With industry and patience the author brings together a great deal of matter; yet he fails in producing the impression that Switzerland is a country yielding large materials for a history of art. He says (p. 2) that "no land has been more thoroughly travelled over, none has been more superficially tested for art than that of his birth." The first part of this statement will be accepted by most persons as correct. The second may suggest a doubt. It is a question whether research has been as shallow in Switzerland as Dr. Rahn supposes. It is probable that many persons have tried to make themselves acquainted with the antiquities of Swiss valleys. The harvest has been small because it is in the nature of things that Switzerland should be rich in natural scenery, but poor in monuments of art.

J. A. CROWE.

FIVE PAINTINGS BY FREDERICK LEIGHTON, R.A.

MR. LEIGHTON, R.A., has at this moment on the easel five pictures all but finished, four of which are of considerable size. The first, *An Ancient Juggler*, is one of those rare creations whose perfect development has been hindered by no adverse accident. The idea stands before us complete. Every force of art has harmoniously contributed to its adequate embodiment, and we get as the result a form in which all added labour of finish has but enhanced the brilliant spontaneity of the first thought. The juggler, a woman, stands fronting us, her feet pressing on a leopard skin; at her back rises a white screen framed in gold. On this ground the pliant lines of the beautiful figure define themselves, and the warm flesh-tints derive an added richness from the cool tone against which they glow. She casts two oranges in the air, and watches for their descent with outstretched hands. Drapery which has been thrown off lies on the ground beneath, and partly covers the base of the screen, which is decorated with a graceful frieze of dancing figures. Close by her feet to the left stands a golden vase and other implements of her craft. The screen does not fill the whole background, but on each side of it we catch the clear bluish gray of a bright sky above the thick fruit and foliage of an orange grove. It is a difficult task to put into words which shall sound neither fanciful nor exaggerated the impression produced by this work. It is in vain to seek for a phrase which may con-

vey the equivalent of the intense pleasure which it affords, and where the unity of the whole is so perfect, any attempt at description seems mere destructive dissection. On the other hand, it will not do to take refuge in general expressions where so much skill of a definite quality requires to be discriminated. The effect of tone produced on the eye at first sight is transparently luminous; the whole picture seems to shine with a subdued radiance as of ivory enriched with gold. This effect of light and brilliancy is heightened by the science with which Mr. Leighton has massed all his strongest colour at the base of the composition: the dark leopard skin, the folds of crimson drapery, crimson running into blood-purple, the deep gold of the vase, on the lip of which rests the vivid scarlet tassel dropping from the rod inserted in its mouth. The edge of this first step, as it were, is accentuated by a succeeding line of light given by the white drapery, to which succeed, on either side of the screen, the dark tones which lie where the orange trees spring from the ground—tones which become clearer and less marked till they break on the open sky. All the deeper tones of background, and accessories combine, it will be seen, to form enfolding wings of colour, which spread out and upwards from the feet of the figure, which rises in their midst against the white screen like a statue of clear flame. The painting of the flesh itself, the warmth and rich variety of colour, which melts into perfect unity of tone, bestows a sensuous charm, for which Mr. Leighton's previous work will have hardly prepared his public; but everyone who has studied this painter will expect to be gratified by admirable technical thoroughness, and to find him treating the nude with that elevation of style and intellectual intention which alone can elicit from it the highest quality of abstract beauty of form and line—that quality which affords at once the keenest and the purest pleasure which a highly trained eye can receive.

Clytemnestra—the *Clytemnestra* of Aeschylus, has afforded to Mr. Leighton, in his second picture, a motive of a wholly different order. The Mycenaean queen stands alone on her battlements, and watches for the moment which may bring to sight the fires which shall flash from peak to peak news of the fall of Troy. This is the moment which Mr. Leighton has thought out into a vivid realisation. The contrast to be found in the perfect calm and repose of external matter, which veils the inner storm of passions working out towards desperate resolve, is the key-note of the design. The painter has sought to heighten this contrast in the laying of every line of the composition, by the scale and the key of colour employed. The hour is night; "Air sleeps, from strife and stir the clouds are free. The holy time is quiet as a nun Silent in adoration." The opposing crest of rugged mountain, the waters at its feet are steeped in silence. The straight descending line of a flagstaff on the right accents the erect pose of the motionless figure; the solemn impression of these vertical lines is heightened with great skill in the disposition of the drapery. The folds which escape the nervous grip of the tight-clenched hands drop down straight to the feet, and the mass which hangs from the left shoulder descends to the ground in a weighty sweep. We must look into the face of the queen before the full intention of this statuesque quiet is revealed. She gazes outwards, and from her eyes we learn that all the forces of life are sucked into a struggle too absorbing to admit of the escape of any superfluous energy by the way of speech or gesture. The artist has been equal to his invention. In this painting we see again the same thorough workmanship, the same completeness of thought and execution which distinguishes the *Ancient Juggler*. Mr. Leighton is not content merely to suggest, he makes out everything with true classic resolution. The character of these two works is, indeed, wholly different. The *Ancient Juggler* brings us pure enjoyment; *Clytemnestra* commands our

respectful admiration and intellectual appreciation. It would seem as if the process of which each invention is the product had been wrought out by somewhat differing methods, as if a greater force of conscious will and mind had gone to the fashioning of this re-creation of the heroine of Aeschylus, whilst the *Ancient Juggler* is the more spontaneous outcome of a quicker sensitiveness to impressions of pure beauty.

The inner court of a Jew's house at Damascus, peopled by a group of women and girls, is the subject of a third picture. The building is full of lovely colour and light; on the right rise the tall shafts of a row of lemon trees, their laden branches supported on a slight and lofty green trellis. A woman stands beneath, engaged in knocking off the fruit, whilst a little girl extends her skirts in both hands watching for its fall. Others to the left look on. At first sight the subject would seem only likely to yield a motive for purely picturesque treatment, but in art as in literature severe studies seriously pursued leave an indelible trace on all expression, and we find in this picture the large qualities of style proper to Mr. Leighton's more important work, and which confer dignity on another charming bit of eastern life, viz., a scene passing in the garden of the same house which forms the subject of a fourth painting. In the distance we see the serrated edges which crown the roof of the dwelling, and down the centre, beneath the rapidly succeeding green arches which festoon across it, runs a little stream; by its edge in the near foreground passes a child playing with two peacocks, one white, the other blue. The whole scene wears a strangely fanciful aspect, as of an enchanted palace inhabited by the little actor in some far-off fairy tale.

For the subject of a fifth picture, which is at present scarcely so far advanced as either of the above-mentioned, Mr. Leighton has selected the procession of the Daphnephoria, a festival celebrated at Thebes every ninth year in honour of the Ismenian Apollo. A full account of this festival is given by Proclus. At the head of the procession walked a noble and beautiful youth, called the Daphnephoros; behind him followed his nearest kinsman, bearing a mystical instrument. This instrument, which Mr. Leighton has carefully constructed from the descriptions given in the text, consisted of a piece of olive wood surmounted by a brazen globe, from which smaller ones are suspended. Both above and below, this rod was wreathed in garlands of laurel and flowers. The globe on the top indicated the sun, the one immediately below the first symbolized the moon, the smaller globes represented the stars. The garlands, being 365 in number, indicated the course of the year. Next came the priest bearing a laurel branch, and behind him marched a choir of maidens singing, with boughs in their hands. On this wise the procession passes before us in Mr. Leighton's little picture, full of glad fluttering movement and happy life.

E. F. S. PATTISON.

THE SOCIETY OF LADY ARTISTS.

It must be confessed that the exhibition of this Society, lately opened at No. 48 Great Marlborough Street, is a depressing sight, embarrassing to the male visitor who is at once courteous and critical. There may, we suppose, be some good commercial or practical reasons why a separate exhibition of the works of female artists is held every year; for this is (if memory serves us right) the eighteenth annual display, and it can hardly be assumed that such a scheme would be continued so long if no professional advantages resulted from it. These advantages would naturally consist partly in the opportunity of here collecting a considerable number of works which might be overlooked in a larger and ambisexual gathering, or many of which indeed would have no chance of finding room there; partly in the definiteness hereby given, in the public eye, to the art-

movement among women; partly in the ambition to excel, and the *esprit de corps*, which is thus fostered in the contributing ladies themselves. On all these grounds, we have always wished well to the Ladies' Exhibition, and hoped to find in it the seeds of development and of skill; although, contemplating the matter from a merely abstract and reasoning point of view, we could never hesitate to say that the right plan is that women who are good painters should exhibit along with men who are the like, and women who are bad painters should run the same chance of exclusion as men of similar artistic calibre. Experience shows that the Lady Artists' Exhibition had at starting a fair amount of vitality, but unfortunately not a large share of excellence or of progressive power, nor the capacity of attracting to itself the co-operation (which was essential to a real success) of all the foremost female artists. Someable ones do contribute—as, for instance, Mrs. Boyle and Mrs. Bodichon; others hold decisively aloof; and at no time have the best of the ladies, as a combined and compact body, made this gallery the show-place for their most complete and important efforts. As matters now stand, the prolongation of the exhibitions of this Society is not of moment to the cause of art—rather perhaps detrimental and misleading. They may still, however, be welcome to some deserving professional and amateur ladies; and we can scarcely reason ourselves into wishing for their discontinuance. A well-meant endeavour, and hopes that were at one time of no mean scope, would come to an end along with the Society.

The oil-pictures in this collection number only 156, as against 430 water-colours. We will, however, begin with the oil-pictures, as being the more elaborate form of work. Making this division in a general way, and the subdivision between figure-subjects and others, we shall simply go round the walls, pointing out here and there the few things that call for specification.

Miss Blanche Macarthur sends, in the small female head named *Amée*, one of the most competent examples of execution. The *Bachelor's Breakfast* of Miss Flora Ward is at once recognisable, by style and tone, as the production of one of the E. M. Ward family; it is more satisfactory in tint than the *Wild Flowers* by Mrs. Ward, a very black-shaded and consequently heavy-looking presentment of a little boy in the open air, holding his straw hat wreathed with poppies. Miss M. E. Edwards (Mrs. Staples) has painted *Written on the Sand*—a damsel in white muslin who reads the words "I love my love" inscribed on the sea-beach. Though better than most things here, it presents nothing worthy of particular remark, or calculated to further Mrs. Staples' reputation as a painter. Miss Solomon shines out amid her colleagues. *A Monk, Rome*, very sombre in tone, is ably done; while *Spring-time* (a water-colour subject of Florentine or Boccaccasque lovers reading, or, as we might say, a Paolo and Francesca of a less impassioned kind) is one of the few contributions having something of the quality of a picture. The same may be affirmed of *Green Mantle (Redgauntlet)*, by Miss Fanny Sothern, a single head of a brunette with her cheek resting in her palm, characterised by style and ease. Again, *The Jesuit*, by Miss Mary S. Tovey, though the face is somewhat hard and exaggerated, is a broad, well-subdued piece of life-sized portraiture, evidently showing that the painter has had a definite conception of her personage. *Tobit's Return to his Father*, by Mrs. Benham Hay, is the most important work in the gallery for subject and aim in treatment. It has been exhibited before, and, whether seen once or often, must be pronounced far from satisfactory. Why the picture of Miss Charlotte J. Weeks is named *Il Contadino, Study from Life*, we have no idea. A "Contadino" (as even a Suffolk Street exhibitor or visitor knows) is a countryman, a peasant; whereas this head appears to be that of a mediæval scholar or philosopher. The phy-

siognomy has much force—the look of a temperament full of laborious power, which has been invested in head-work and frequent vigils, rather than in body-work and reinvigorating exercise. The execution is in harmony with the character of the sitter. *A Lady Writing a Letter*, by Miss Biller, and *A Spanish Dancing-Girl*, by Miss Mary Goddall, also deserve to be mentioned.

We now turn to the water-colours, or rather, first of all, to a crayon head, by Miss Emma Sandys, *Fair Rosamond*. This has—what one knows may be counted upon from the sister of so excellent a draughtsman and worker as Mr. Frederick Sandys—an amount of steady highly-trained drawing very exceptional on these walls. It cannot, however, be regarded as at all an agreeable or fascinating ideal of the lovely Rosa Mundi; the face is peculiar, and, though in its way not unhandsome, is the reverse of winning. Miss Eliza Sharpe, that well-known matriarch of female art, sends two works, *Les Souvenirs* and *The Puzzling Question*. Both must have been painted from thirty to forty years ago, to all appearance; indeed, *Les Souvenirs* (in some form of engraving, probably in an annual) is a reminiscence of our boyhood. Miss Elizabeth Thompson shows unusual cleverness in *The Tenth Bengal Lancers at Tent-pegging, Sealcote, 1871*; the motion of the horses and riders here is really excellent, and everything is touched off with spirit and firmness. Miss Beatrice Meyer may perhaps be a pupil of Edouard Frère or of Mr. Boughton. Her *Street-Scene in Liverpool*, portraying a young Italian street-singing girl and her miscellaneous auditory, has both truth, character, and a certain unstudied quaintness of arrangement faithful to the matter-of-fact, and consistent with good method in painting. If Miss Meyer can only manage to carry a little further the good gifts she possesses, she may prove an accomplished artist. The large single figure of *Francesco*, by Mrs. Backhouse, a Roman peasant holding a handful of flowers, is a salient production. Cleverness it has enough, and ease more than enough; both perilously "cheap." The contributions of Miss K. Reed, Miss C. J. Atkins, Miss H. Kempe, and Miss A. E. Manly, the two former named *A Study of a Head*, and the two latter *La Belle Fermière* and *Une Paysanne Belge*, are all above the Society's average.

Among the landscapes and miscellaneous subjects in oil we have to notice *Aylmer's Field*, by Miss Jane K. Humphreys—a portrait (as one may call it) of a grass field massed with poppies and other wild-flowers, and with a hare crouched in its form, all rendered with a true sense of natural profusion, though not with any very delicate skill upon near inspection. *A Land-Storm*, by Miss Ellen Thornycroft, shows a green plain amid hills, a brown hurrying mountain-stream, and a few dishevelled pines, with a horse lying dead at the foot of one. The poetical character of this work is genuine, and even its style tends high, but the execution belongs to a rudimentary stage. The last oil-picture which we shall mention is *Evening Primroses*, by Miss Fanny Duncan. Here the manner has been learned to some extent from the masterpieces of M. Fantin-Latour; the handling is hasty and even slap-dash, but there is taste in its abruptness, as well as manifest dexterity.

Among the water-colourists, Miss Harriet Harrison contributes *Herring-bont, Berwick-on-Tweed*; again a very sketchy production, but superior in artistic perception to most of its competitors, and with some affinity to Mr. Whistler's style. Mrs. Bodichon is always forcible and significant; she has an eye for whatever she undertakes to render, and a hand to express it. Her water-colours are named *Study of Cactus in the Consul's Garden, Algiers, December, 1873*; and *Cranes in the Plain of the Cheliff, Oran, Algeria*. Miss Alice Boyd is another of our lady artists who is an artist in the way she sees things, and makes others see them; her *Chapel of San Clemente, St. Mark's, Venice*, will be grateful to the eyes of many lovers of that marvellous church, now much more clearly

lighted than it used to be, but hardly so potent in mysterious richness of suggestion. E. V. B. (Mrs. Boyle) sends the most conspicuous specimen in all the gallery, under the modest title of *Brush-work, in Four Compartments, for a Screen*. The colour of this is very prominent and eye-catching; not however unsuited to its purpose, supposing its environments to be appropriate. The first compartment shows us a white owl and his mate; the second, a black cat in a tree, prowling; the third, a white Persian cat dozing in a tree, to the discomfiture of a pair of birds who would like to re-enter their nest; the fourth, two black monkeys in a vine. The first of these subjects is the best, and extremely good; the third, a comparative failure: the series as a whole well worthy of its author's genius and attainments. *The Old Parsonage, Eastbourne*, by Miss Marian Croft, is deftly touched, but wants solidity and mellowness of tint. Nicely but rather primly handled is the *Fuchsia* of Miss Sarah Linnell. *Condover*, by Mrs. Owen, is a landscape of the scenic order, perhaps with a good deal of "composition" as well as matter-of-fact; it belongs in a general way to the Turner tradition, and ranks well among treatments of its class. Miss Louise Rayner is, as usual, clever in her picturesque street-scenes, such as *Head of the West Bow, Edinburgh*; but she does not seem to advance, nor to try to advance, beyond a certain point. *An Elizabethan Interior* is creditable to Miss Aurelia Hähnel.

W. M. ROSSETTI.

MR. NEWTON'S SECOND LECTURE ON THE DISCOVERIES OF MR. WOOD AT EPHESUS.

ROYAL INSTITUTION (March 21).

THE subject of this lecture was the nature of the Ephesian Artemis and the character of her worship, her temple, its treasures and lands, the ministers of the temple, and the ritual of the goddess. Referring to the scene in the theatre on the occasion of St. Paul's visit, and to the fanaticism then shown in defence of the goddess whom the Ephesians so loudly asserted to be Great, and whose worship, as they alleged, extended over the whole Roman Empire, the lecturer adduced other evidence to show how widely this worship had been disseminated, in some measure, perhaps, by the agency of commerce. The Ephesian Artemis was not originally an Hellenic deity, but rather an Asiatic deity, whose attributes were assimilated by the Greek settlers to that of their own Artemis. On the later coins of Ephesus, and in certain statues to be found in the Italian museums, are preserved copies, more or less exact, of the Ephesian Artemis, who, like other primitive Asiatic divinities, had an archaic form overlaid with symbols, the meaning of which is for the most part lost to us. The Ephesian Artemis, like the Artemis of Magnesia, was Polymammia, furnished with several rows of breasts—the symbol, according to St. Jerome, of her force as the nurse of all vegetable and animal life. Other symbols, such as the signs of the zodiac round her neck, seem to indicate her lunar character; the bees, again, which are the constant type of the early coins of Ephesus, and are arranged in rows on the statue of the goddess seem rather a Chthonian symbol. Passing from the goddess to her temple, and the externals of her worship, the lecturer explained the system by which the Ephesian Artemision, and the other celebrated temples of the Hellenic world became banks of deposit, accumulating treasure not only in the form of precious dedicated objects, *anathemata*, but also by receiving in trust sums of money, bullion, or other valuables, on account of States or private individuals. As this treasure accumulated, it was employed by the administrators of the temples in loans, as we see by comparing an Ephesian inscription, published by Boeckh, with the one relating to Mithradates, referred to in the previous lecture, and published by Mr. Waddington. The Ephesian Artemis had

not only this treasure, which might be called her personal property, but also real property in the form of lands. The tenures by which such sacred lands were held may be inferred from certain leases preserved to us in inscriptions, and from a well-known passage in the *Anabasis* of Xenophon, in which the historian describes his dedication to the Ephesian Artemis of a small temple encircled by a park in the territory of Laconia. A portion of the land immediately surrounding the Ephesian temple was an asylum or sanctuary in which criminals and debtors could take refuge. The limits of the asylum were enlarged by Alexander the Great, Mithradates, and Mark Antony in succession, but the abuse of the privilege of sanctuary became so great under Augustus, that he restricted the asylum within narrower limits. An inscription relating to this limitation was discovered by Mr. Wood in the angle of the peribolos wall which formerly marked the boundary of the asylum.

Closely connected with the privilege of sanctuary was the institution of hierodules or slaves dedicated to the goddess. These at Ephesus, as in other temples of Asia Minor, such as Zela and Comana, were a numerous body, recruited, doubtless, sometimes from fugitive slaves, as is shown by a curious story in the novel of "Klitophon and Leukippe," by Achilles Tatius. In some temples, as at Delphi, the slave was made over to the god by a regular deed of sale by which he became his servant. The lecturer then passed on to notice the priesthood at Ephesus, which, as is evident from inscriptions, was a very numerous body, though it would be difficult in the present state of our information to define the functions of the several ministers and their subordination in a hierarchy. Among the sacerdotal officers named in inscriptions were the Thesmodi, who declared the will of the goddess, Hymnodi, who might be considered as her poets laureate, charged to write odes in her honour, and the Theologi, who collected the sacred legends. The entire month of Artemisios, corresponding with our March, was dedicated to the worship of the goddess, as appears from a decree published by Boeckh. During this month the panegyris of the neighbouring cities met at Ephesus, and gymnastic and other contests were held. On May 25, in the month Thargelion, was celebrated the birthday of Artemis. It appears from the great Salutaris inscription, discovered by Mr. Wood in the theatre, that on this day a procession of the priests carrying sacred images and vessels, and escorted by the ephebi, proceeded from the temple through the Magnesian Gate to the theatre, and back from the theatre through the Koressian Gate to the Temple. The lecturer concluded by quoting an animated description of this very procession from the Greek novel called "Ephesiaica" by Xenophon.

ART SALES.

THE miscellaneous collection of engravings, the property of the late Thomas Lupton, the distinguished engraver, were sold on Wednesday by Messrs. Christie & Manson. More interesting, however, than the sale of the engravings themselves, was that of the copperplate of *Dumbarton*, that is, one of the unpublished plates for *Liber Studiorum*: one of the plates ready for publication, but not actually published when the issue of the series was stopped. Mrs. Noseda bought it, along with five working proofs on French paper and seven proofs on English paper, for the sum of 38*l*. Two or three good impressions from the published plates were also sold: one of *Dumblain Abbey*, a proof before letters, engraved by Thomas Lupton, realised 12*l*. The engraved steel plate of *Folkestone*, an unpublished plate not belonging to the *Liber* series, went for 4*l*. 5*s*. Some popular modern line engravings were included in the sale: among them a proof before letters of *Bolton Abbey*, by S. Cousins, after Sir Edwin Landseer, was sold for twenty guineas. A proof of Sir

Joshua's *Mrs. Stanhope*, by J. R. Smith (one of the rare and much prized mezzotints), was sold for 27*l*. 10*s*. These are some of the more interesting details of the sale. Thomas Lupton's name will be known to many readers, not only as a much employed engraver in many kinds and qualities of work, but specially as the engraver—under Turner's immediate and constant supervision—of some of the more famous of the *Liber* prints: among them the great subject of *Solway Moss*. His collection of engravings—if, indeed, the whole of it came to Christie's—was strangely deficient in examples of the greater *Liber* prints engraved by himself; since of the published prints engraved by him, two only were represented—the *Dumblain Abbey* before mentioned, and the *Watercress Gatherers*: *Scene at Twickenham*.

A COLLECTION of foreign pictures, chiefly of the French and Belgian schools, was sold on Wednesday last by Messrs. Foster at their Gallery in Pall-mall. The most important were:—Bacalowicz, *The Visit*, 173*l*.; Heullant, *Paul and Virginia*, 162*l*.; W. Verschuur, *The Horse Fair*, 253*l*.; V. Tirion, *The Doll*, 120*l*.; E. Verboeckhoven, *Sheep and Poultry, in a landscape*, 210*l*.; *Sheep and Poultry*, 787*l*.; Another, same subject, 472*l*.; II. J. Scholten, *The Terrace*, 225*l*.; A. Passini, *The Market Place, Constantinople*, 724*l*.; Emile Lévy, *The Toilet*, 157*l*.; Herman Tenkate, *A Guard-room during the Spanish War in Holland*, 183*l*.; Emile Saintin, *Wild Flowers*, 215*l*.; Innocenti, *Italian Market Scene*, 84*l*.; Leon Escosura, *The Guitar Player*, 71*l*.; Haynes Williams, *A los Toros—Spanish Scene*, 367*l*.

FOR the last three days of last week the rooms of Messrs. Christie, Woods & Manson were thronged with visitors to view the marvellous collection of Sèvres porcelain belonging to Mr. Wm. Goding. In all, sixteen vases and jardinières, besides cups, &c., derived from the choice cabinets of Mrs. Fitzherbert, Sir W. Waller, the Duchess of Cleveland, Captain Ricketts, and others. The sale realised the most sanguine expectations. A cup and saucer of turquoise blue, beautifully painted, from the collection of Mrs. Fitzherbert, sold for 180 guineas. A rosewater ewer and basin of the finest bleu de Vincennes, richly gilded, 109 guineas; and another of turquoise, 130 guineas. A third, from the Stow collection, rose Pompadour, 116 guineas. A pair of small oviform vases of bleu de roi, exquisitely painted, with figures of Apollo and Narcissus, sold for 480 guineas; and a large pair, turquoise, from the collection of Captain Ricketts, 610 guineas. A set of three oviform vases and covers, with flattened openwork handles, bleu de roi, and medallions painted by Dodin, the centre 17 inches high, sold for 600 guineas, hardly a commensurate price as compared with some of the others. The éventail jardinières sold well: one of turquoise ground, with figures of shepherd and shepherdess, sold for 650 guineas; and two of the most lovely apple-green ground, most charming pieces of colour, fetched 1,800 guineas. The two little turquoise vases of curious form, the handles formed to hold lights, from the Duchess of Bedford's collection, 410 guineas. But the most fabulous price was attained for the last lot. A pair of vases, with covers and stands, of most rare form, the sides fluted in six compartments, green ground, with rose Pompadour foliage, painted in medallions, the necks and covers of openwork, the stands curiously perforated to hold bulbs, all of the most brilliant colouring, was knocked down to Lord Dudley for the incredible sum of 6,500 guineas, amidst the acclamations of the whole room. Never had *pâte tendre* such a triumph. The forty-four lots realised just upon 14,000*l*.

SOME important sales took place last week at the Hôtel Drouot. Among them the *Débats* mentions (1) a magnificent piece of tapestry, dating from the beginning of the sixteenth century, with designs in gold and silver, in circular compartments, representing scenes from the Old and New Testaments. It realised 20,000 fr. (2) A large

oval dish painted in Limoges enamel, sixteenth century, 4,050 fr. (3) Two large ivory sculptures in high relief, representing allegorical subjects, beginning of the 17th century, 4,080 fr. (4) A Louis XVI. clock, 1,135 fr. Other interesting items were:—three pieces of Gobelin tapestry, with subjects from the New Testament, after Bérain, 1,000 fr.; the months, grouped in pairs, important fragments of large tapestries decorated with allegorical figures of the months represented, with rich borders composed of flowers, game, figures of genii, &c., time of Louis XIV., 1,830 fr.; an interesting series of parts of Gobelin tapestries, with designs after Bérain, representing scenes of acrobats, animal-tamers, &c., 3,520 fr.

NOTES AND NEWS.

WE learn from a letter, dated Athens, 12th March, that Dr. Schliemann has been to Mycenæ on a reconnoitering expedition. It was to be expected that on the spot where the tomb or treasury of Atreus had been discovered, other remnants of the past would come to light, if only the Greek Government would be less jealous, and allow foreign archaeologists to do what the Greeks themselves seem not inclined to do. We do not know whether King George has taken a higher view of the subterranean treasures of his country than to keep them like coal-beds for future generations, and has given Dr. Schliemann a permission which has so often been refused to other explorers. At all events, Dr. Schliemann, after his successful campaign at Troy, has been to Mykenas, has opened his approaches, and has already recovered some interesting antiquities. In order to ascertain what the accumulation of rubbish in the different localities of Mycenæ might be, he investigated the Acropolis in thirty-four different places. He opened six shafts on the first terrace, which runs nearly horizontally to the Lion's Gate, and two on the second terrace. He reached the rock on the first terrace at a depth of 15, 17, 18½, and 20 feet; on the second, at a depth of 12 and 20 feet. He dug up pottery which he describes as splendidly ornamented, two stone axes, one flint arrow, a number of idols, of which five are Hera with a *polos* on the head, and a number of little cows of red terra-cotta. There are about 15,000 cubic metres of rubbish to be explored, and Dr. Schliemann expects to find thousands of antiquities, if only the Greek Government will allow him to continue his work. Considering how much Greece owes to the sympathy of scholars, might it not show for once its interest in its own antiquities by allowing so experienced and successful an explorer as Dr. Schliemann to excavate the capital of Agamemnon, or, still better, the district of Olympia.

THE Fine Arts Club is no more. It is now eighteen years since it was established, for the purpose of facilitating intercourse between lovers of art, and of giving collectors the opportunity of comparing their acquisitions, and of obtaining information upon art subjects. All who enjoyed the social meetings and charming receptions given at the principal houses in London, when collections of works of art were brought together for exhibition, will regret their discontinuance; but the increasing difficulty of finding members who had not already received, to open their houses, and the want of a sufficient number of important works of art for exhibition, led the committee to call a general meeting of the Club, which was held on the 13th of this month, in the house of the Burlington Fine Arts Club, Savile Row, Sir William Drake in the chair, when it was declared that the time had arrived for the discontinuance of the Club, and it was therefore declared to be dissolved.

SOME workmen near Beddington, Croydon, have discovered the remains of a Roman warrior, who had evidently been buried in his armour, together with some arms, at a depth of eighteen inches only from the surface.

THE Institute of Painters in Water-colours

has broken through the rule by which hitherto artists have been expected to make application for election to the Royal Academy and the other Fine Art Societies. On Monday evening they selected for their membership Messrs. Oakes, Tyer, Simpson, Tenniel, Hardy, Houston, and Woolf, without solicitation on the part of the artists so honoured.

DR. J. VAN VLOTEN has just published a tolerably bulky volume on the *History of Painting in the Netherlands* from the fourteenth to the eighteenth century. It is illustrated by fifty woodcuts and a steel engraving of Rembrandt.

PROFESSOR NORTON writes to the *Nation* that certain American bankers in Italy are adding to their legitimate profits by undertaking to popularise art in America. They have galleries for the display of sculptures for sale, and workshops at Carrara, where wages are low, under the charge of a foreman who can make any model required. If their customers require a classical statue, they have only to make a selection from a set of photographs, and are provided with an exact facsimile; though, if there is any defect in the work of Pheidias or Praxiteles, it is corrected, as nothing that is not perfect is allowed to go out! If a domestic subject is required, the want can be easily met. Thus a statue of Ruth was got up but was not successful; till a member of the firm, on looking over his photograph book, conceived the happy idea of forming a statue of Rebecca as a pendant to Ruth, out of the Faun of Praxiteles. "So I sent for my foreman," said this promoter of art to Professor Norton, "and said to him, 'Now, you take this, and you make me a design for Rebecca out of it; it's got to be draped, and it's got to be a woman.' So he took it, and he brought me a sketch, and I didn't like it, and then he made me another, and at last he made me this one, and then we wanted something to show who it was; and so we put in this symbolic well here, and altogether it's just about the most popular work of American art going."

THE Exhibition, at New York, of the American Society of Painters in Water Colours has lately closed. It was as successful as that of last year, but was not marked by much originality. The *Nation* observes that "the respectable, rather abject condition of the art in New York was evident in a large showing of calm, unvitalised works. That New York is soon to have a 'school,' or even an eye, able to look at nature in a somewhat original or individual way was not promised with any plainness. . . An exception to these strictures was contributed by Mr. Homer. . . Some remarkably original and studious boating-scenes were shown by Thomas Eakins," a pupil of M. Gérôme.

ATTENTION has been directed to the condition of the Landseer lions in Trafalgar Square, which, it seems are becoming terribly dilapidated under the influences of time and weather. These evils are difficult to avoid; but surely something might be done to guard the noble animals against mere wanton injury. On the occasion of the show of the last Lord Mayor, we noticed a number of young rascals clambering upon the lions, sitting astride upon them, and even standing on the bas-reliefs in their anxiety to gain a sight of the procession, and no doubt the same thing happens at all other sights of the kind.

THE Council of the Society of Arts has voted 20*l.* to the Royal Architectural Museum, in furtherance of the classes lately established in this institution for the technological instruction of artisans.

THE publication of subscription lists to charities is, it seems, by no means a custom of modern date, only, instead of the donors' names being advertised in the *Times*, they were formerly written in marble. We learn from the *Times* that the Prince of Wales has lately presented to the British Museum a marble pillar, with a long and interesting Greek inscription,

recording a public subscription that was raised in the town of Rhodes in a time of great distress, for the relief of the sufferers. Three pillars of this description were, it is stated, set up in Rhodes on this occasion, with the names of the donors inscribed upon them, and the sums given by each. When the Knights of St. John built their church in Rhodes they used one of these pillars as a paving stone. Their church was afterwards converted into a mosque, and the vaults under it into a powder magazine. In 1856 the powder exploded and shattered the pillar-paving stone into many pieces. A few were lost, but the greater number were presented by the Pasha to the Prince of Wales, and thus it happens that the memory of a charitable deed done ages ago has been preserved unto the present day.

A PICTURE by M. Henri Lehmann is to be exhibited next month at the Ecole de Droit. The subject is *Le Droit prime la Force*.

THE Académie des Beaux Arts has nominated M. Hébert to the place left vacant in the section of painting by the death of M. Couder.

THE monument in memory of the defence of Belfort, briefly mentioned in our last, is to be executed by M. Bartholdi, and the design is already complete. On a platform, cut in the solid rock, overlooking the town, but overlooked by the citadel, will stand a colossal lion—not the wounded lion of Lucerne, but the lion rising from the ground to face the danger on the first alarm. The expression, says the *Débats*, is well chosen and happily rendered.

THE valuable archaeological collection of Lieutenant Delaporte, who accompanied Francis Garnier on his fatal expedition, after remaining for some time in the court of the Louvre, has now been removed to Compiègne. The authorities have decided on utilising the now desolate palace as an Indo-Chinese Museum.

THE *Annual Report of the Director of the National Gallery* for the year 1873 was issued yesterday (Friday). Only one picture was purchased last year, the *Triumph of Scipio*, by Andrea Mantegna, of which we spoke at the time. Two bequests are noted: the first, a portrait, by John Hoppner, R.A. (1750-1810), of the Countess of Oxford, Jane Elizabeth, wife of the fifth Earl of Oxford, bequeathed by her daughter, Lady Langdale. The second is thus described: "Jan Looten (painting 1659), Dutch School—A River Scene, with Wooded Banks: Evening. Bequeathed by the widow of Mr. Jewer Henry Jewer." Both these are hung temporarily at South Kensington.

THE church of St. Antholin, at the corner of Size Lane, in the city, is about to be pulled down, and a notice has been issued to the friends and relatives of the dead buried within its walls to the effect that they will be permitted to remove their remains, under proper direction, to any other consecrated burial place, as also the tablets and monuments erected to their memory.

DURING recent alterations that have been made in the fine old early English Church of Bottesford, near Brigg, Lincolnshire, it was discovered that the floor of the nave had been raised some eighteen or twenty inches, and, as a consequence, that the bases of the columns of the north and south arcades had been buried. These, which have been carefully preserved, are of singular character, being widened out so as to form seats—octagons on the north and circles on the south. In days before the introduction of pews, devout persons were accustomed to kneel throughout the whole of the mass, except when the creed was being said. Mirk, in his *Directions for Parish Priests* (circa 1420), instructs the pastor to teach his flock:—

"No non in chyrche stonde schal,
Ny lene to pyler ny to wal,
But fayne on kneus they schule hem sette,
Knelynge down vp on the flette."

Conveniences of this sort were perhaps in the mind of the author when he elaborated these directions. The seats, it may be imagined, were for the aged and infirm, who were unable to comply with the stricter discipline. A similar arrangement may be seen in the south arcade pillars of the Church of Coddington, near Newark; and a writer in the current number of *Notes and Queries* quotes a document, dated 1487, which sets forth that Walter de Sheryngton desired to be buried in the Priory Church of St. Bartholomew, Smithfield, under a low tomb, "for men to knele and lene upon" while they heard mass.

THE STAGE.

THE NEW PIECE AT THE HAYMARKET.

ABILITY, like Property, has its duties as well as its rights, and *Queen Mab* is written so well that it ought in fairness to be written much better. It is a good conception, marred, if not spoilt, by most imperfect execution; or rather I am not sure that one can speak of a "conception" with regard to it, for "motive" it has none at all, though it was near to having a very good one. But at least the author has had one happy thought—the character of Mab and the nature of her surroundings. Had he been more thoroughly in sympathy with her he would have avoided the mistakes which lessen not only the value, but the interest of his play. He dreamt of a Bohemian who should be free not only from the conventionalities of *le monde*, but from the taint of the *demi-monde*. He has presented her at first with great force and distinctness (to be sure, he cannot be too grateful to the actress who impersonates her), but then he has ceased, as it were, to sympathise with his own creation, and has compelled Miss Robertson, after the first act, to represent no Bohemian heroine at all, but a colourless reproduction of the everyday woman of fashion—not of real fashion, it is true, for that might have afforded him an individual study, however inconsistent with the study with which he began; but a woman of merely fashionable exterior, entirely uninteresting, splendidly dressed, and (for dramatic purposes) profoundly worthless.

But, for his first act, one is grateful to Mr. George Godfrey, whoever Mr. George Godfrey may be—and whoever he is, he has noticed Mr. Robertson and studied Mr. Gilbert. Nay more, he has been charged with a travesty of Mr. Robertson, and there is certainly much in the first act, in the Bloomsbury lodging, to remind one of *Society* and a little to remind one of *Caste*, but Mr. Robertson is not quite the fountain-head that he is represented to be. Some people think that he invented Bohemia. But he did not invent Bohemia. For modern literary purposes, Henri Murger invented Bohemia. Still there are resemblances between *Caste* and *Queen Mab* which Mr. Godfrey would have done well to avoid. When the shoulder of mutton is brought home in a basket by the Bohemian heroine, and when that heroine talks knowingly about tripe (Dickens invented tripe; Toby Veck ate it in *The Chimes*) one thinks of that tea-party in *Caste*, at which Captain Hawtree was privileged to assist; and, what is worse, the resemblance instead of being natural and inevitable, is unnatural and forced, for the dwellers in this Bloomsbury lodging are after all of a very different set from the dwellers in that Westminster bye-street. There is no miserable father whom one would like, like Portia 'very vilely in the morning, when he is sober, and most vilely in the afternoon when he is drunk.' It is Bohemia here, if you will, but it is not St. Giles's or Somers Town, and in so far as the life here depicted resembles *Caste*, it does not resemble Bohemia.

But the likeness to the work of Mr. Robertson is not, as I said, in this respect great. In the Bohemian journalist there is something to remind one of the club in *Society*, and of the elaborate process to which its members resorted to raise the

sum of five shillings in ready money; but the general tone of the work is more like Mr. Gilbert's—manly where his tone is manly, disagreeable where his tone is disagreeable—and were it not for the quite remarkable lack of any power of construction, which one can put down to no momentary lapse or droop, but only to inexperience which should one day be overcome, the work might indeed be Mr. Gilbert's own. Certainly he would have nothing to be ashamed of in the writing of the first act. They must talk very well in Bloomsbury, if this is a fair sample of their dialogue. The art of conversation must still survive in Bloomsbury—could one but get into those privileged Bohemian circles, and hear it where it is at its best. But apart from the good talk, in the first act there is a strong interest in the story; or, at the least, the beginning of a stronger interest than one can be expected to take in the story of common society—in the great question whether Angelina shall dance with the baronet, or whether Rosamond shall spend a fortnight at Brighton; themes, which in the hands of the accomplished novelist, are almost too ample for a three-volume tale. In this Bloomsbury Street and lodging, there is the material for a stronger interest. Here they struggle for life itself, instead of for precedence. So here there is all the interest of struggle: the interest of the probability of failure. Besides, it is pleasant to be taken into a place where romance may still seem natural; where also, if they do live upon bread and cheese and stout, at all events they seem to relish it.

The play becomes lamentably weak and improbable when the little quarrel caused by a fancied imputation on the honour of the unknown hero who has saved Mab's life by the sea, is made to serve as sufficient cause for the angry withdrawal of Gerald Carew from the presence of Mab: Gerald Carew being actually himself the unknown hero, and the author desiring to still conceal from Mab the knowledge of this fact. Sane people, and especially good-hearted ones, do not quarrel desperately upon so slight a ground; but unhappily the improbability, here at its height, has been manifested slightly before—for is it likely that when an old gentleman goes to call at an unknown lodging, and upon absolute strangers who live completely out of his own world, his son shall seek him there—shall enter unannounced—except upon the principle that a man is to be sought only in places where he is not likely to be found? Yet it is upon no stronger pretext than this, that Mab, in the Bloomsbury and Bohemian lodging, receives the visit of young Gerald Carew when she is busy with her cooking, and enlivening her operations in a parlour-turned-kitchen by a *pas seul* and snatches of old songs.

These things are faults of management fatal to stage success; but the rapid transformation of Mab herself from the simple-hearted yet shrewd girl of the first act to the elegant woman of the second, who retains, neither in manner nor thought, any trace of the Bohemia in which her heart was fixed erewhile, shows a want of truth to character; a want of full and unfettered sympathy, fatal so long as it lasts, not, perhaps, like the other, to stage success, but to high literary and dramatic excellence. For all this, there are one or two excellent sketches of character, indicative of great promise, which one hopes may speedily be fulfilled. Mab herself, as long as she stays in Bloomsbury, is very fresh and lively and entertaining. The journalist, one confesses, has been met with before, and so has the "swell," whose heart would not be so very bad, if only he were not so much ashamed of it; but the "swell" is not quite so dull as we have sometimes found him, and the journalist talks his epigrams—instead of writing them, I suppose, as he still requires to reside in Bloomsbury lodgings, where the stairs are shaky and the service not altogether to be relied upon. The sketch of the Manchester woman, who is rather vulgar and showy, but quite outspoken and sincere, is a true one. The

fifth-rate actor—Mab's *soi-disant* uncle—is effective on the stage, though not new. When one hears of his pride in recollecting the day when he bore a banner before Edmund Kean in a way in which, it was universally admitted, no banner had ever been borne before, one thinks of many similar reminiscences, and, last of all, of the uncle of the heroine in *Ought we to Visit Her?* who played the trombone in the orchestra. But, though this comic actor is not wholly new, he forms one of a capital group—the group that gives the piece its character, and whatever vitality it may have:—I mean the Bloomsbury lodgers: Mab and her uncle, and his newspaper friend.

There is one grave fault of taste, if not of feeling; and that is the kind of talk that passes, at a given moment, between Gerald, the hero, and his father, Sir Greville, when Sir Greville says that a certain frailty rather becomes a man, as rouge does a woman: "only, in my time, they laid it on thicker." The saying is not in good taste, I opine. But let that pass—it is not natural; and not to be natural is, for a dramatic writer, a graver thing than only not to be tasteful. So many faults!—others might yet be pointed out; and yet *Queen Mab* is a piece which will bore no one, for even the ill-constructed later acts are not tedious at all, and the first act puts one into so excellent a temper that Fate can hardly harm one till the play is done. And as I began by assuring Mr. Godfrey that, being able to write so well, he has no business to refrain from writing still better, so let me end the comments on the piece itself by one other expression of my sense of its real, though most unequal literary merit—of its pungency, its keenness, its bristling repartee. There is, of course, a little bitterness along with all the earnestness of the satire. If there were not, it would hardly be satire of our day. We live, of course, in a time when our dramatists, if they are clever men, can hardly pretend to believe in much besides the virtues of a few women. So just the correct kind of cynicism is here, visibly enough, but with it, too, a little earnestness—a little manly enthusiasm. When Mab gets rather famous as a painter, some one says of her that she is very clever: "so clever that she would be a genius, if she only knew some newspaper people;" and later, when she is quite famous, some one says she will be one of the elect. "You will write R.A. after your name, and from an *artist* you will subside into a maker of pictures."

The acting is excellent, when judged by present standards; nay, would not be by any means bad, if judged by the standard of greater days. Mr. Buckstone plays the fifth-rate actor with much rich unctuous humour—the unctuous humour that is amusing its second generation of admirers. It is long since he has had a part so good for him. Seemingly he enjoys it very much; at all events he is more at home in it than he was as the private detective in *Charity*, or as the great art patron in *Pygmalion and Galatea*. Mr. Kendal's character of Gerald Carew, of the Life Guards, is not so fully developed by the author as was his character in *Charity*. Mr. Kendal acts it well, but there is not very much to be made of it. Mr. Howe looks and plays quite satisfactorily as the good-hearted journalist whom Mab, had she been true to Bohemia and to Life, ought surely to have married. Mrs. Chippendale is mistress of all her resources in the representation of the lady of Manchester blood. Miss Helen Massey is commendably disagreeable as that lady's daughter—an entirely selfish and thin-natured girl to whom it would be a revelation that a woman may have delicate feeling even if she doesn't live in Mayfair. Mr. Buckstone, junior, and Mr. Everill fill two insignificant parts. The great part is Miss Robertson's, and through the whole of the first act it is as good as any leading actress could desire. There are fine moments for her too in the second act, but little that is worth much in the third. Thus it is that Miss Robertson, beginning admirably, ends somewhat

ineffectively. She is the romp of the Bloomsbury parlour—the good genius of its rough inmates—to the life. Here she acts with infinite zest, with great heartiness, and as great truth. Here every touch is the right touch; not a note goes wrong. Further on in the play one is bound to report that she is not so satisfying. She lives in the merriment of the piece, and lives too in its anxiety; often the worn strained face is assumed with a full dramatic sympathy. But her declamatory passages—the moments when she should be strongest—are rendered with an elocution not always perfectly natural: with something too much of deliberation for the accent of genuine passion. Also a mannerism may be noted, and noted here with all the better grace, because I suppose no one will assert that in these columns there has been lack of hearty appreciation of the actress now in question. On the stage she nearly always receives a greeting or a compliment, whether merely courtly or enthusiastic, in a way that is unchanged, her own and unique—that is, she manages to convey in the clearest (nay, also in the wittiest) of ways, by gesture, tone, and smile, that she holds the compliment or greeting to be entirely insincere. It is as if one said continually, "you are exceedingly polite to pay me compliments with so much trouble—really I am almost indebted to you for getting up on my behalf so capital a make-believe!" This mannerism, though sometimes exactly what is wanted, is quite as often out of place; and unless we are wrong, so good an actress would do well to amend it. *Queen Mab*—to say a last word to the reader—is one of the cleverest and most imperfect things seen recently in London. It is worth a visit to the Haymarket, not to find out, in the second and third acts, how faulty is its story, but to hear, in the first, the wit of the dialogue, and to see the acting of Miss Robertson—here so unconventional, so spirited, so seemingly spontaneous.

FREDERICK WEDMORE.

THE Criterion Theatre opened its doors on Saturday night. It is a daintily decorated little theatre, chiefly underground; but one may forget that one is in a cellar when the cellar is lined with satin and lace. The entertainments presented were of a kind with which the public is familiar: that is to say, there was the orthodox attraction of a couple of pieces by men of known names, and the presence on the stage of several actors and actresses who have elsewhere acquired some celebrity. At any other place than a theatre, and with any other public than the theatrical public of London, a little freshness of idea would have been acceptable; but the stage is nothing if not conservative, and no doubt Mr. Byron did wisely to give us some such a comedy as he has given us before; and Mr. Gilbert still more wisely to develop for the third or fourth time his once original idea of a world in which everything is upside down. From a business point of view, nothing could be better than the arrangements at the Criterion. Conservative principles are as sound upon the stage as anywhere else; and innovators, as all the world knows, make other people's fortunes—not their own. For the rest, neither piece presented at the Criterion Theatre is without the power of raising a laugh. Even *Topseyturveydo* would not be Mr. Gilbert's if we couldn't laugh at it. Mr. Byron's *American Lady* is a succession of effective scenes, written with the smartness which characterises the dialogue of this author. No one blames Mr. Byron for being too dull: on the contrary, it is only too easy to him to be merry. The conduct of his fable must itself be arrested, that this or that type of modern mankind may discharge a comic remark, to which another type of modern mankind, who happens to be equally gifted, will reply with another comic remark, which in its due turn provokes a rejoinder. In Mrs. John Wood, who plays the chief part in *An American Lady*, Mr. Byron has secured an actress who is fitted to do justice to his work, and who is greatly approved of by the

public. Mr. Byron himself appears upon the stage, and assumes with his wonted success the languid composure of which he is a master. A good deal of applause is deservedly bestowed on the efforts of Mr. J. Clarke and Mr. David Fisher. Miss Fanny Hughes, Miss Jane Rignold, and (in the afterpiece) Miss Fanny Holland, from the Gallery of Illustration, also render their best services in aid of the entertainment of the evening. Scenery, stage-fittings, and properties leave nothing to be desired.

THIS evening, at the Queen's Theatre, a pupil of Mr. Ryder's makes her first appearance on any stage. The play is Sheridan Knowles's *Hunchback*, and the character is Julia. The lady's name is Miss Leighton.

Petticoat Government—a somewhat famous farce by Dance—has been revived at the Vaudeville with a much stronger cast than is usual with farces; for Mr. Farrer, Mr. Horace Wigan, and Miss Larkin take part in the performance. Thus, with *London Assurance* and the burlesque of *Ruy Blas*, a very ample entertainment is provided for those who would be merry at a theatre.

Mary Queen of Scots will be withdrawn to-night.

MR. TOOLE will play, we believe, in several of his favourite parts during his approaching engagement at the Globe Theatre. He will act in America in August.

A CORRESPONDENCE has been published between the Lord Chamberlain's Department and the managers of the French plays in London. The object of Messrs. Valnay and Pitron has been to induce the present Lord Chamberlain—Lord Hertford—to reconsider his predecessor's decision with respect to the refusal to allow certain works of high literary and artistic merit to be performed in London. In view of the engagement of Monsieur Got, Madame Favart and Mademoiselle Blanche Pierson, the Lord Chamberlain is specially requested to license *Le Demi-Monde*, by Dumas the younger; *Seraphine*, which had almost the last success obtained by Sardou at the Gymnase; *Julie*, by Octave Feuillet, played at the Français; and last, *Le Supplice d'une Femme*, which M. Emile de Girardin claims as his own, but in which he was assisted by the author of *Le Demi-Monde*. The Lord Chamberlain declines to license any one of these pieces. It remains to be seen how far his refusal affects the engagement of the celebrated artists we have named. Got and Favart have been seen here before, and one supposes that the pieces then acted by them are still open to performance; but Blanche Pierson comes for the first time to England, and one asks, with some curiosity, in what pieces this most excellent artist is to be permitted to appear. Though known to the most cultivated public of Paris for now many years, her last success has been her greatest. Perhaps Messieurs Valnay and Pitron will ask the Lord Chamberlain to license *Monsieur Alphonse*; so that Londoners may see Mlle. Pierson at her best.

OCTAVE FEUILLET's new drama *Le Sphinx* was played for the first time last Monday night, at the Théâtre Français, by Delaunay and Maubert, Mademoiselle Croizette, Mademoiselle Sarah Bernhardt, and others. We shall in due time be able to give a full account of it.

MUSIC.

NEW MUSICAL PUBLICATIONS.

The Singing Class Book, by Orlando J. Stimpson (London and Glasgow: W. Collins, Sons & Co.), is intended for the use of teachers and scholars in elementary schools. Beginning with the very rudiments of musical notation, it carries on the learner till he has arrived at sufficient proficiency to be able to take his part at sight in a moderately easy round or glee. The system on which the work is based is that of key-relationship, and it is in this respect similar to the Tonic Sol-fa system; but

the ordinary musical notation is used from the first; and this will probably commend the book to many teachers who, while cordially accepting the principle of singing by key-relationship rather than by absolute pitch, object to the new notation as unnecessary. The explanations and instructions, while concise, are extremely clear; the chapters on the formation of scales and on modulation (the point at which the pupil's real difficulties begin) being especially good. In addition to the mere exercises, the work contains nearly sixty rounds, glees, &c., and being published at a low price, and in a convenient shape, is likely to meet with a large circulation.

The Union School Song Garland, edited by William McGavin (Glasgow: Wm. Hamilton), is another work intended for the use of children. It is printed in Hamilton's patent "Union" musical notation, the peculiarity of which is that it shows at a glance, not only the absolute pitch of each note, but also its position in the key. The book contains some 300 songs for children, simply and easily arranged for two trebles and a bass. In its pages are to be found, not only a large number of old established favourites, but many less known pieces, including several written expressly for the work. Great care has been exercised in the selection and adaptation of the words, and many an old friend with a new face meets us as we look through the book. For instance, the words of "Here's a health to all good lasses," can hardly be recommended as suitable for the little ones; so the very pretty old tune is set to the unexceptionable text, "Where the beauteous flowers are growing," &c. The book is a perfect thesaurus of melodies for young people, though, from its very nature, it has no great merits in a merely musical point of view. It is, however, admirably suited for its purpose, a commendation which cannot always be bestowed on works of much more pretension.

An Account of the Remarkable Musical Talents of Several Members of the Wesley Family, by W. Winters (London: F. Davis), is not a work which calls for any detailed notice. It consists of a reprint of a manuscript written by Samuel Wesley, the well-known composer, not long previous to his death, which is at present in the library of the British Museum. To this is prefixed what Mr. Winter terms a "Memorial Introduction," composed mainly of biographical sketches of various members of the family of the Wesleys, and with especial reference to their musical abilities. Samuel Wesley's was one of the rare instances in which infant prodigies do not in later years disappoint the promise of their youth. The little work under notice is full of interesting details, and those who are curious in biographical matters will find it worthy of their attention.

Geschichte des Concertwesens in Wien, von Eduard Hanslick (Wien: Wilhelm Braumüller), though not absolutely a new work, is almost unknown in this country, and from its great usefulness to the musical historian, deserves a short notice. It is one of those laborious works of reference which no one but a German would have the patience to undertake, and the compilation of which must have involved years of labour. It gives a complete record of all the concert doings in Vienna during the past century, and from its very superabundance of detail renders a detailed analysis or review impossible. Here may be found the dates of the first appearances at Vienna of all the great performers, and of the first productions of important works. It is of course impossible for us to verify all Dr. Hanslick's dates, but the reputation which he enjoys in Germany is such that he may be taken as a safe guide. The work is divided into four books, entitled respectively, "The Patriarchal Time," (1750-1800—Haydn-Mozart Epoch) "The Association of Dilettanti" (1800-1830, Beethoven-Schubert Epoch), "The Virtuoso Time" (1830-

1848, Liszt-Thalberg Epoch) and "The Artists' Association" (1848-1868, Musical Renaissance Epoch). A serviceable index is given at the end of the book of the names of all the performers mentioned in its pages; but its value as a work of reference would have been much increased had a similar index of the compositions been included. As it is, in order to find the date of the first production of a new work, it is necessary to know the approximate date, and then to hunt through the portion of the book which treats of the period referred to, in order to obtain the required information. In spite of this drawback, however, the work will be found most valuable to all students of musical history.

EBENEZER PROUT.

MACFARREN'S "ST. JOHN THE BAPTIST."

THE first performance in London of Mr. Macfarren's new oratorio, which was given yesterday week by the Sacred Harmonic Society, attracted a very large audience, among whom were to be seen many of our most distinguished musicians. It will be remembered that the work was written for last year's musical festival at Bristol; and it was first performed in that city, under the direction of Mr. Charles Hallé, on October 23. The overture had been heard in London at the concerts of the British Orchestral Society, as well as at the Crystal Palace; but, unless we are mistaken, none of the vocal music had previously found its way into our concert programmes.

The oratorio is divided into two parts. The first, entitled "The Desert," treats of John's preaching in the wilderness, and of the baptism of Jesus. The second, and longer part, is inscribed "Machaerus," and deals with John's rebuke of Herod, the feast at which the daughter of Herodias danced before Herod and his nobles, and the imprisonment and subsequent execution of the Baptist. The libretto, which has been compiled by Dr. E. G. Monk, is excellent.

The music itself bears evidences, as a whole, of highly cultivated talent, rather than of spontaneous genius. The hand of the thoroughly accomplished musician is to be seen on every page, but, united with extreme technical cleverness, there is in parts a certain amount of dryness, as if the ideas had rather been sought for than had come of themselves. The choral portions of the work are far superior to the solos. Especially admirable in every point of view are the three choruses of the nobles (for male voices) in the second part, "O King, live for ever," "Lo, the daughter of Herodias cometh in," and "Lo, the wrath of the King." In these pieces we find Mr. Macfarren at his best. There is not only a wild barbaric splendour about them, but also a melodic and rhythmic charm which we confess we could not find in some of the other numbers of the work. With a daring, the justification of which is to be found in its complete success, the composer has ventured to introduce into sacred music such *prima facie* secular instruments as the triangle and tambourine. That this should have been done without producing the slightest feeling of incongruity, speaks no little for the skill and tact of the writer. Exceedingly fine, too, in a more ecclesiastical style, is the concluding chorus of the first part, "My soul, praise the Lord," in which the old psalm tune, known as "Hanover," is treated fugally with the greatest ingenuity—an especially noticeable point being the introduction of the theme as a *canto fermo* for the brass instruments, in augmentation, against the moving counterpoint of the voices. The final chorus of the oratorio, on the other hand, is comparatively weak; the fugal subject, though cleverly treated, is too "straggling." The close, however, is redeemed by a fine and effective pedal point. One more chorus should be mentioned—that for female voices in the first part, "This is my beloved Son." Here Mr. Macfarren is undoubtedly ploughing with Wagner's heifer. The score is like a page out of "Lohengrin;" indeed, the very same de-

vice of divided violins *con sordini* and a harp accompaniment may be found on pages 34 to 36 of the published full score of that opera. The senichorus pleased so much as to obtain an encore, as did also the chorus concluding the first part, of which we have already spoken.

Of the solo music not much need be said. It is always ingenious, and appropriate to the text; but there is little which produces an impression beyond that of cleverness. One of the best numbers is the unaccompanied quartett, "Blessed are they which are persecuted for righteousness' sake," which was encored.

With respect to the performance it is impossible to speak too highly. The music is in places very difficult; and the amount of labour which Sir Michael Costa must have expended on its preparation can hardly be imagined. Both chorus and band were admirable. The solo parts received full justice at the hands of Madame Lemmens-Sherington, Miss A. Sterling, and Messrs. Lloyd and Santley; indeed the entire concert reflected the highest credit on all who took part in it. Mr. Macfarren, who was seated in one of the side galleries, was called forward and "ovated" (as our American friends say) at the end of the first part, and again at the conclusion of the work.

The oratorio as a whole is one which is worthy of its composer's reputation, and which will probably maintain its position in the repertoire of our choral societies. We must not omit, for the sake of those who wish to make its acquaintance, to say that it is published, in a cheap and very elegant edition, by the firm of Stanley Lucas, Weber and Co.

Last Saturday's Crystal Palace Concert was open to the reproach—not an uncommon one, unfortunately, at these otherwise excellent entertainments—of being far too long. The natural result was that a very large number of the visitors left before its close, and moreover that the concluding piece—Brahms's "Variations on a Theme by Haydn"—was played to an audience whose attention had already been severely taxed, and who certainly were not in a fit condition of mind for the due appreciation of this very elaborate work. Of the composition itself we spoke on its first performance a few weeks ago, and need only add now that, like all really good music, it improves on acquaintance. The other orchestral pieces at this concert were Beethoven's Symphony in B-flat, No. 4, and Sullivan's sparkling and brilliant overture to *The Sapphire Necklace*. Herr Joachim played Mendelssohn's violin concerto and two movements from a sonata of Bach's in his own inimitable style, and vocal music was contributed by Madame Sinico and Mr. Vernon Rigby. We have deferred till last the mention of the specialty of this concert—the first performance in England of Brahms's "Song of Destiny" (*Schicksalslied*). This work is unquestionably one of the noblest inspirations of true genius which have been produced for many years. Its importance is such as to deserve a somewhat detailed notice. This, however, we must reserve for our review columns, and confine ourselves now to saying that it depicts with wonderful beauty of expression the contrast between the calm repose of the blessed, and the changeful lot of suffering humanity. In Brahms's music melody, harmony, and orchestration are alike enchanting. The work, which is written for full chorus and orchestra, was excellently performed. The Crystal Palace Choir has of late remarkably improved; and the manner in which the very difficult intervals and modulations, so frequently occurring in the work, were attacked was most commendable, and gave evidence of much careful training on the part of Mr. Manns. The only weak point was (if the paradox may be allowed) too much strength; the piano passages being in places hardly subdued enough. It is to be hoped that a second hearing of this exquisite piece will soon be afforded.

The programme of last Monday's Popular Concert, though containing no novelties, was pro-

bably on that very account the more acceptable to a large number of the audience. There are many who prefer a piece with which they are familiar to any new work, whatever its merits. It is unnecessary to enter into any details respecting music so well known as that performed at this concert. Herr Joachim, with Messrs. Ries, Straus and Piatti, gave Mendelssohn's brilliant Quartett, in E flat (Op. 44). Signor Piatti (who has been justly called "the Joachim of the violoncello") delighted his hearers by his performance of Boccherini's Sonata in A, with piano accompaniment. Nothing can be conceived more perfect, whether as regards tone or phrasing, than this great artist's playing. Mr. Charles Hallé gave Beethoven's familiar Sonata in D (Op. 10, No. 3), to which he seems especially partial, and joined Herr Joachim in the even more familiar "Kreutzer Sonata." Madame Edna Hall was the vocalist, and Mr. Zerbini the conductor.

Next Monday, the Director's benefit, and last concert of the present season, takes place, when an even more rich and varied musical treat than usual will be provided. EBENEZER PROUT.

ROYAL ALBERT HALL CHORAL SOCIETY.

THE announcement of a performance ("by desire") of Mr. A. Sullivan's oratorio, *The Light of the World*, at which their Royal Highnesses the Duke and Duchess of Edinburgh had intimated their intention of being present, attracted an enormous audience to the Royal Albert Hall on the evening of the 19th inst. Considering the small interest generally evinced by the metropolitan public at the production of a new oratorio, or, indeed, of any new musical work, and computing it as a fact that for each individual who goes to hear a new composition, a hundred will go to listen to such well-worn works as *Messiah* or *Elijah*, it may be taken for granted, without prejudice to Mr. Sullivan, that the great majority of the vast audience, which has been variously stated as numbering seven and nine thousand, came together rather with the hope of getting a sight of the royal bridal pair than for the sake of listening to Mr. Sullivan's oratorio. The brilliancy of the spectacle of this well-filled vast arena, and the brightness and variety of colour of evening toilets, made all the brighter by gas illumination, was even more imposing than the inauguration ceremony, which her Majesty the Queen attended on a cold spring morning in 1871, when cloaks and overcoats were gladly requisitioned, even at the cost of concealing from view the small amount of colour we are habituated to, and which is so necessary to relieve the dull monotony of our dreary and generally leaden-hued climate. The audience were well seated before the arrival of the royal party, which included the Prince and Princess of Wales, the Duke and Duchess of Edinburgh, Prince Arthur, the Princess Louise, the Duke of Teck, and the Princess Mary. Immediately on their appearance in the royal box, the National Anthem was sung, followed by the Russian Hymn, arranged for this occasion by Mr. J. Barnby. To this succeeded prolonged cheering, which was acknowledged by repeated bows from the royal party. The incongruity of combining a regal show with the first performance in London of a work of such solemn purport as *The Light of the World* must be apparent to all; and, unaccustomed as unhappily we have been to such shows in this country, the excitement consequent thereon and the splendour of the scene could not but have its effect even upon those who had come together simply and solely to hear and pass judgment upon the new work. Some allowance may, therefore, be claimed for those who, hearing it for the first time under such unusual circumstances, are called upon to express their unbiassed opinion of its merits.

The Light of the World was written on commission for the late Birmingham Festival. Musical works produced under such conditions, and written against time, have seldom proved success-

ful. Wondrous stories have certainly been told of Handel composing an entire oratorio in a few weeks' time, but it is impossible to say how far he had matured his ideas before setting pen to paper. The amount of manual labour required for the production of such a work nowadays is very much greater than it was in his day, owing to the great development of orchestration since his time. Though ample time, we believe, was allowed Mr. Sullivan for the completion of his work, we can readily believe that he felt himself pressed for time towards the last, as any one must be who undertakes to supply a work of such dimensions by a certain date, however remote. We therefore willingly make all allowance for any shortcomings on this score. It is easy to imagine him, some months before the festival, running about, amidst the harassment of other engagements, from this friend to that, to seek for counsel as to the choice of a subject for his work, and after having at length found a friend, perhaps as much harassed as himself by the cares and troubles of this world, willing to supply him with a libretto, being obliged to await his friend's leisure.

Oratorios may be divided into two classes: those which belong exclusively to the Church, such as Bach's Passion Music—the perfection of ecclesiastical oratorio; and those which, following the form brought over from Italy by Handel, employ biblical subjects either for purely artistic purposes, or partly with a view to religious edification. *The Light of the World* clearly comes within the latter category. It has been the tendency of modern times to treat oratorio more as a musical drama than in the old ecclesiastical form. Indeed, so strong has been the feeling in favour of dramatising, as evinced by Mendelssohn, especially in his *Elijah*—at once the most dramatic and the most popular of oratorios that one has come to look for something like a plot of sustained dramatic interest as a matter of course. This we do not find in *The Light of the World*, which may be accurately characterised as consisting of a succession of scenes from, or bearing upon, the life of Christ upon earth, the logical sequence of which, and their bearing upon each other, is not always at first sight apparent. The intention of the work, as the librettist has stated, is to set forth the human aspect of the life of our Lord upon earth, exemplifying it by some of the actual incidents in his career which bear specially upon his attributes of Preacher, Healer, and Prophet. Dealing respectively, in the First Part, with the "Nativity," "Preaching," "Healing," and "Propheying" of our Lord, ending with the triumphant entry into Jerusalem; and, in the Second Part, with the utterances which, containing the avowal of Himself as the Son of Man, excited to the utmost the wrath of his enemies, and led the rulers to conspire for his betrayal and death; the solemn recital by the chorus of his sufferings, and the belief in his final reward; the grief of Mary Magdalene at the sepulchre; and the consolation and triumph of the disciples at the resurrection of their Lord and Master—these "scenes" are laid respectively at Bethlehem, Nazareth, Bethany, on the way to and at Jerusalem.

It is probable that it is this dramatising tendency, to which we have alluded, which has led to the licentious treatment of Sacred Writ, which of late years the concoctors of oratorio "books" have so freely indulged in, and which seems to be on the increase. One would have thought that it would have had a directly contrary influence, and would have brought into existence dramatic poems on sacred subjects, whether biblical or not, of real poetical merit and adapted for musical treatment. But it seems as difficult to find a real poet for an oratorio as for an opera "book," and composers have been thrown on their own resources or on the kindness of friends for the provision of a text. The process in vogue seems simple enough, and may be undertaken by any one in the possession of a reference Bible and a con-

cordance. Having made choice of a subject, the *dramatis personæ* come of themselves, and there being (as it would seem) no irreverence or incongruity in putting words into the mouth of one person which are recorded to have been spoken by another, the dialogue is easily filled in. Anachronisms have been admitted, and events suggested by the context, but which are not actually recorded, have been freely turned to account. Such a process of manufacturing oratorio "books" is very like the game of making up a story which must consist entirely of quotations. We tremble to think of the possible result of such a process carried to its extreme point. We may live to see an oratorio put forth consisting entirely of "words compiled from the Holy Scriptures," but the main subject of which, together with the personages represented, need have no place in biblical history. On account of the example set, it is to be regretted that the librettist of *The Light of the World* has largely followed the method of procedure we have drawn attention to as reprehensible, though of course he has not done so to the extent we have pointed out as possible. The skill and ingenuity displayed in his share of the work is, however, undeniable. That Mr. Sullivan should have failed in doing justice to the theme proposed to him is not to be wondered at, when we take into consideration its sublimity. So tremendous a subject could only be treated successfully by a genius of the highest kind, and by one endowed with the strongest religious feelings. We know nothing of Mr. Sullivan's endowments in this latter direction; but, judging from his former essays in sacred music, as instanced in his *Prodigal Son* and *Festival Te Deum*, which were claimed as successes on their production, but seem now to be well-nigh forgotten, we should by no means have selected him as the man best fitted to carry out so serious an undertaking. With the seriousness of the task in hand he seems to have been duly impressed, but the general result of his music is one of heaviness and dullness, often suggestive of a Gregorian chant sung slow. The highest credit, however, is due to him for his skilful instrumentation—his strongest point—but in the work before us this is throughout of a more sombre character than usual with him, as doubtless the nature of the subject suggested. Though as a whole the *Light of the World* is unsatisfactory, it is not without its merits. Among the most noteworthy of the forty-two "numbers" of which it consists may be enumerated, in order: the solo and chorus, "In Rama there was a voice;" the chorus, "I will pour my spirit;" the quintett, "Doubtless thou art our Father;" the chorus, "The grave cannot praise thee;" the chorus, "Hosanna to the Son of David;" the unaccompanied quartett, "Yea, though I walk through the valley;" and the final chorus, "Him hath God exalted." The solos are its least satisfactory part. On its production at Birmingham, Mr. Sullivan was strongly advised to curtail his work, and this he has done; but no amount of pruning could detract from its general heaviness or add strength to its weakness. The performance at the Royal Albert Hall, under his own direction, was, on the part of the band, and of the four principal vocalists—Madame Lemmens-Sherrington, Madame Patey, Mr. W. H. Cummings, and Mr. Santley—an eminently satisfactory one; but one could not but wish that more time had been bestowed upon rehearsing the choruses. Miss Spiller and Mr. Maybrick assisted in the subordinate parts, and Dr. Stainer rendered efficient service at the organ. That Mr. Sullivan—who possesses undoubted talent as a composer, overrated though it may have been—after frittering away much valuable time on the production of ballads for the music-shops, has again turned his attention to the composition of a work of serious import, is a matter for true congratulation, even though his efforts have not been crowned with perfect success. But by those who have followed him from

the outset of his career it is to be regretted that his music to *The Tempest*—his Opus 1—undoubtedly still remains his best work.

C. A. BARRY.

COPENHAGEN celebrated the centenary of the birth of Weyse, the founder of the Danish school of music, on March 5. The composer's comic opera of *The Sleeping Potion* was performed at the Royal Theatre, and nothing is to be heard at the concert-rooms but songs, fantasias, and sonatas by this old fashioned but still popular musician.

SCARCELY had Copenhagen ceased to celebrate the memory of its old musician, than one of the most popular of its living composers was taken from it. H. C. Lumbye, whose dance-music is known to every band in Europe, and who was idolised in Denmark, died on the 20th of March. He was born in 1810, and began the study of music in 1822, at Odense, where his father's regiment was stationed. When he was fourteen years of age he entered the army himself as trumpeter, and composed all his earlier works in the open air, marching up and down in front of Amalienborg Palace. In 1843 he was made musical director of Tivoli, the Crystal Palace of the Danes, the band of which, under his care, became one of the very best in Europe. He was no scientific composer, but his polkas and galops were inimitable for freshness and *verve*. He has suffered for two years from mortal disease.

THE coming week being Passion Week, the Royal Albert Hall Choral Society, under the direction of Mr. Joseph Barnby, will give performances of sacred music on each evening. On Monday and Saturday the *Messiah* will be performed; on Tuesday the *Hymn of Praise* and *Stabat Mater*; while Wednesday, Thursday, and Friday are to be occupied with Bach's *Passion Music*—a work for the repeated hearing of which musicians are greatly indebted to Mr. Barnby.

ON Wednesday, the 18th inst., a concert was given at the Guildhall, Cambridge, in aid of the funds for a statue to Bach, to be erected at Eisenach. Herr Joachim was the great attraction, and was supported by local pianists and vocalists—all services being rendered gratuitously. The first part of the concert, which was in every respect thoroughly successful, consisted entirely of works by Bach.

BACH's *Passion* according to John was performed on the 19th inst., at Great St. Mary's Church, Cambridge, under the direction of Dr. J. M. Garrett, with organ and small orchestra, to a very crowded congregation.

H.R.H. THE PRINCE OF WALES has graciously promised to preside at the annual dinner of the Royal Society of Musicians, on the 27th of April.

KING LUDWIG of Bavaria has opened a provisional credit of 100,000 gulden towards the completion of Wagner's theatrical enterprise at Bayreuth. According to the latest accounts from Germany, Wagner expects to open the theatre on May 1, 1875.

WEBER's *Freischütz* has been recently produced for the first time, and with complete success, at the Italian Opera at Madrid.

It is reported in German papers that Rubinstein intends to give up playing and devote himself entirely to composition.

EDVARD GRIEG, the young Norwegian composer, is at present at work upon an opera, the libretto of which is from the pen of Bjørnstjerne Bjørnson.

THEODORE THOMAS has been giving four concerts at Chicago, in connexion with the Apollo Club in that city. On the last evening, Schumann's *Paradise and the Peri* was performed with complete success.

At the sixth symphony-concert of the Peabody Institute at Baltimore, a remarkable programme,

consisting exclusively of Scandinavian music, was provided. The composers represented were Gade, Kuhlau, J. P. E. Hartmann, Grieg, and A. Söderman.

POSTSCRIPT.

MR. SEYMOUR HADEN has a very large etching in progress. It is a rendering of Turner's *Calais Pier*, in the National Gallery, and bids fair to be equal in power and interest to anything the artist has produced.

WE hear that Professor Corsen, who is carrying through the press his great work on the Etruscan Inscriptions, expresses himself as no more disturbed by Mr. Isaac Taylor's book, *Etruscan Researches*, than by the Earl of Crawford and Balcarres' work, *Etruscan Inscriptions*, published last year.

MR. H. NETTLESHIP is bringing out a second edition of the third volume of Conington's *Virgil*, as also a second edition of Conington's *Persius*.

A COLLECTION of engravings was exhibited on Thursday, at the Society of Antiquaries, by Edwin Freshfield, Esq., representing the city of London at various dates, especially the parishes of St. Margaret Lothbury, St. Christopher, and St. Bartholomew the Little, by the Exchange. Of these the most remarkable were a view of London in 1560; an engraving with representations of London before and after the great fire; a plate containing all the city gates, and a curious Dutch engraving of the execution of Charles I., with portraits of the King, Cromwell, and Fairfax in medallions at the top of the plate, and scenes connected with the trial in compartments surrounding the principal picture.

THE sons of the late Mr. H. W. Wilberforce are bringing through the press a volume of the articles contributed by their father to the *Dublin Review*. Father Newman has written a biographical introduction to the volume, which will be published by Messrs. H. S. King & Co.

WE regret to learn that it is proposed to construct a railway from Naples to the crater of Mount Vesuvius. The journey will be made in an hour and a quarter, and the line is to cost three or four million francs. Signor Gallanti is enabled, by his study of the subject, to guarantee the safety of passengers in the event of an eruption.

TABLE OF CONTENTS.

	PAGE
LIFE AND LETTERS OF SIR GILBERT ELLIOT, by T. E. KEBBEL	331
LORD LYTON'S FAIBLES IN SONG, by G. A. SIMCOX	333
SCHWEINFURTH'S HEART OF AFRICA (Second Notice), by G. BIRDWOOD	334
GEORGE'S GENEALOGICAL TABLES, by H. A. POTTINGER	336
MISS BUSK'S FOLKLORE OF ROME, by W. R. S. RALSTON	337
NOTES AND NEWS	338-341
NOTES OF TRAVEL	341
THE FALL OF PRINCE FLORESTAN (An Anonymous Communication)	341
SELECTED BOOKS	343
CORRESPONDENCE:—	
On The Discoveries in the Troad and Egyptian Monuments (Second Letter), by François Lenormant; A Phœnician Inscription, by Dr. Wright; on Metrical Tests, by F. G. FLEAY	343-345
APPOINTMENTS FOR NEXT WEEK	345
THE APPROACHING TRANSIT OF VENUS, by W. H. M. CHRISTIE	345
THE FOURTH REPORT OF THE ROYAL COMMISSION ON SCIENTIFIC INSTRUCTION	347
NOTES AND NEWS; MEETINGS OF THE WEEK	349
HISTORY OF FINE ART IN SWITZERLAND, by J. A. CROWE	350
FIVE PICTURES BY FREDERICK LEIGHTON, by MRS. PATTISON	351
THE SOCIETY OF LADY ARTISTS, by W. M. ROSSSETTI	351
MR. NEWTON'S SECOND LECTURE ON EPHESUS	352
ART SALES	353
THE NEW PIECE AT THE HAYMARKET, by F. WEDMORE	354
NEW MUSICAL PUBLICATIONS, by EBENEZER PROUT	355
MACFARREN'S JOHN THE BAPTIST; by the same	355
SULLIVAN'S LIGHT OF THE WORLD, by C. A. BARRY	357
NOTES, POSTSCRIPT, &c.	358

SATURDAY, APRIL 4, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

An Account of the Township of Ifley, in the Deanery of Cuddesdon, Oxfordshire, from the earliest Notice. By the Rev. Edward Marshall, M.A. Second Issue, with Additions. Pp. viii. and 176. (Oxford and London: James Parker & Co, 1874.)

THIS volume is a re-issue of one originally published in 1870, by the author of the *History of Woodstock*, which was recently noticed in these columns. To the original text there is now added a short appendix of notes, containing whatsoever additional information the writer (whose family has long been connected with the place) has gathered in the interval.

The name of Ifley (a pretty village on the banks of the Isis, two miles from Oxford), is familiar to every student of English architecture in connection with its interesting church, which affords one of the best specimens of rich Norman work, and which, until recently, used to be popularly described as a specimen of Saxon architecture. But those to whom, whether from ecclesiastical or aquatic associations, its present name is like a household word, would hardly recognise it under some of the eighty-four variations which are carefully tabulated by Mr. Marshall. True it is that some of these forms, especially several which are derived from publications of the old Record Commission, appear to arise from misreadings of early documents (e.g. the wonderful forms of Feteleg and Mitteleleg), but *Ivittelai* in the twelfth century, *Istreley* in the thirteenth, *Guffthebure* in the fourteenth, *Zefteley* in the fifteenth, and even *Yeofley* in the nineteenth, would puzzle many a one moderately acquainted with local transformations. And the varieties of interpretation are in proportion to the varieties of spelling. Doctors differ as to whether it means "the field of gifts," or "the island in the flood," or "the land of Ive," or "the meadow on the edge of a wood or stream," or "water island," or whether it was named after a town called Gefle or Yefley, in the Gulf of Bothnia, by some Norsemen, who crossing from the Danelaga into the border of Mercia, not merely made a settlement here, but even contrived in this way to "call the lands after their own names;" so that a remark made by Dr. Guest upon the subject, and twice cited by Mr. Marshall, may well be hung up in warning to wanderers in the delectable, but dangerous, fields of derivations: "In a case of so much difficulty, it is the more prudent, as it is certainly the more honest course, to confess one's ignorance." In Plot's Map of Oxfordshire, engraved in 1677, the neighbouring village of Ferry Hincksey, on the Berkshire side of the river, is called Ivy Hincksey, and it has been suggested that Ivy may in this case represent the Anglo-Saxon "yðu," and be

identical with Water Hincksey, and that a clue to the origin of the name Ifley may be traced herein. In connection with this suggestion Mr. Marshall remarks that the name given by Plot has not been found elsewhere, and that a gentleman (Mr. W. H. Turner), "who has catalogued many hundreds of charters relating to the neighbourhood in the Bodleian Library, has not met with the term Ivy applied to Hincksey." Mr. Turner has, however, recently met with a passage in Hearne's MS. Diary, in which the name is not merely recognised, but explained in its most obvious form. For the Oxford antiquary says (under date of February 17, 1711-12), "This Ferry Hinksey is often called Ivy Hinksey. But there is now no ivy about the steeple and church, as there was formerly. In the late Rebellion all the ivy was cut off from the tower, the consequence of which was so bad that a little after the tower fell down and beat down part of the church."

Among the families whose history finds illustration in this volume are those of De S. Remigio (by a member of which, Juliana, daughter of Robert, the church was given to Kenilworth Priory in the twelfth century), Fitzneel, Nowers, Pitts, and Holliday in connexion with Barten Holliday, the well-known archdeacon of Oxford, who held the rectorial estate as part of the *corps* of his dignity, to which it was until recently annexed. Of the family of Pitts one member, Arthur Pitts, a commentator on the Gospels and Acts, forfeited the property which he held in Ifley by becoming a Roman Catholic recusant and refugee in the time of Queen Elizabeth. Mr. Marshall does not mention that he was instrumental in procuring the publication of the laborious and useful book of Dr. John Pits (to whom he was very nearly related), *De Illustribus Angliæ Scriptoribus*, a work written in opposition to the similar biographical dictionary of Bale, whose name enables the rival author to perpetrate the pun of describing him as a kind of Protestant Baal. In mentioning the separation of some portion of the parish in 1835 by the constitution of a new parish in the hamlet (in our day ecclesiastically famous) of Littlemore, Mr. Marshall preserves the memory of a tract by John Henry Newman, which is not recorded by the latter in the list of his writings given in his *Apologia*, notwithstanding that its connexion with his own favourite abode invests it with a double interest. It was *An Address to my Parishioners on occasion of laying the First Stone of the Church of Littlemore*.

We need scarcely say that the volume is distinguished throughout by the same careful research and complete illustration of its subject which mark Mr. Marshall's *Woodstock* and his other contributions to the topographical history of Oxfordshire.

W. D. MACRAY.

Music and Moonlight: Poems and Songs by Arthur O'Shaughnessy. (London: Chatto and Windus.)

No parrot-cry is more assiduously used by the minor prose-men of the day to discomfit the poets militant, than the dictum that

poetry to be genuine must deal with the burning questions of the hour, must throw light on the economical, political and social difficulties of the present time and place. How purely this is the party-call of men simply adverse to all poetic writing, was shown when a living lyrist unexpectedly turned upon the assailants, and brought out a volume of poems dealing only with the political evolutions of the moment. He was told by the same old familiar oracles that a poet became prosy if he celebrated the Republic. But the cry has only to be analysed to be displayed as a mere croaking or gasping without force or meaning. These burning questions of the hour, what have they in their constitution that a poet can throw light upon? Now and then they deal with subtle emotional conditions, and a poem like *The Cry of the Children* is evolved out of them. Occasionally they admit of dramatic personation, and such an idyll as Coppée's *La Grève des Forgerons* suggests itself. But these are rare exceptions, and the Art of the world may point to its own history in justification of the disregard its latest children show for the social developments around them. It would be difficult to gather from the works of Raphael, Milton, or Mozart what crises of human history they lived in, or to trace there the marks of the sudden progress of liberty. In fact, the initial mistake is one that regards the primal essence of art; poetry is an anodyne, not a tonic, and its function is not to excite the spirit to progress, but constantly to remind the over-eager man of action that a subtle and mystical world of thought lies above and beyond the utmost aim of his action. Hence it is that the greatest successes of works of the imagination have been contemporaneous with the completest national lassitude. It was when we were weary after the Napoleonic wars that the rhymed romances of Scott attained their sudden and unparalleled popularity; it was when France was sick at heart with reaction, that Lamartine's pale and subjective *Méditations* sold by tens of thousands. Will anyone tell us that these two poets would have surpassed their actual success if they had treated the sad and weary problems that the epoch was tormented with. The age that is engaged with burning questions listens to a Lamartine, not to a Hugo, and our own tired generation ought to be willing to turn from its Education Acts and the sad anxieties that vex its work-a-day hours, to a poet who is more mystical than any now singing, and who will be listened to, whatever the minor prose-men say.

In the *Epic of Women* we felt some reflection of the colour of Swinburne; in the *Lays of France* a much fainter tinge of Morris was apparent to careful eyes. In *Music and Moonlight* it would be difficult to detect any foreign influence of this kind. The book belongs to a certain class of art, and runs parallel, as may be pointed out, to the work of other men, but these do not belong to a living, or even English generation, and the similitude is one more of temperament than of style. In Mr. O'Shaughnessy's earliest book, attentive eyes saw beneath the high tone of general colouring an outline of individuality that had little in common with

the sensuousness of surface. No doubt the poet, in those days, believed himself to be anything rather than a purist and an idealist. But through such lyrics as *Seraphitus* and *A Whisper from the Grave* there ran a vein of mysticism that was so evidently sincere, that it promised to survive the affectation which found legitimate utterance in such other poems as *Creation* and *A Troth for Eternity*. As revealed in this new volume, Mr. O'Shaughnessy resembles no English writer, and he no longer has much fellowship with the French Romanticists. It sounds like a paradox, and yet is true, that this most modern of modern singers approaches no one so nearly as one whom we are apt to regard as the most old-fashioned of writers, the veritable poet of moonlight, Novalis! In listening to the writer of the *Song of Betrothal*, of *Outcry*, of *Greater Memory*, we seem to be sitting at the feet of Caroline Schlegel once more; the "blue flower" passes from hand to hand, elective affinities, soon to be fully explained and exposed by Goethe, sigh and whisper in the air, and the old dead dreams of German romanticism are resuscitated in the newest possible dress. But, we reassert, it is Novalis whose voice is most clearly revived.

"We two, made one, shall have power
To grow to a beautiful flower,
A tree for men to sit under,
Beside life's flowerless stream;
But I without you am only
A dreamer, fruitless and lonely,
And you, without me, a wonder
In my most beautiful dream."

In tone, in thought, in melody, it is hardly possible to imagine a closer though certainly accidental literary parallel.

There is an atmosphere about one class of these lyrics that reminds one of the mood one falls into on a summer afternoon, lying in a low warm nook among the rushes, close to the shining level of some river. The uniform golden tone of the foreground, the monotonous blue haze behind, paralyse more than they stimulate the imagination; and if one is alone, one slips into a sad kind of trance, longing, one knows not for what, to complete what ought to be, and is not, pleasure. One would analyse the regretful sense of incompleteness, but in that enervating air any mental effort is impossible. The struggles of a beetle six inches in front of one, who vainly tries to climb up two grass-stalks at once, fascinate and irritate the attention. The ear is keenly occupied with the rustle of a dragon-fly's wings, and the leap of a trout in the water startles one like an avalanche. The sultry stillness of the air penetrates and subdues the brain like a narcotic. The imagination is never more mystical than at these moments, when the mind preserves no objective faculty, and emotion has faded into a vague but infinite yearning. In such a place, at such a time, the *Sehnsucht* of this poetry would move the spirit like music or perfume. The presence of any material objects of affection only irritates one in these languid and longing moments in which the strained heart cries out, "Je ne désire rien, car je désire tout!" The unknown, the ideal becomes nearer and more truly in communion with the spirit than the known, the real.

"O sister-soul and lover,
Mine to eternity,
Whom heart and thought discover
In climes remote to me!
The south wind that brings summer,
The amber-laden sea,
The bird, the latest comer,
Bring these no word from thee?"

The unfortunate thing is, that when the expression of this almost inarticulate yearning is extended beyond the limits of a song or a canzone, the thought is apt to become wire-drawn and wearisome. Opinions will be divided on the merits of the long poem that gives name to the volume. The present writer confesses to feeling somewhat overpowered by its excess of sweetness. A lady, Eucharis, comes back into a music-room after a ball one night, and plays in the moonlight till the spirit of Chopin appears to her, and conducts her down the enchanted river of his own melody to a palace where the marriage of the Phoenix and the Aloe is being consummated. She listens to the songs the Phoenix sings above the opening bud of its bride. At last the amber-coloured spirit of the Aloe issues to the moonlight, and there is more singing. A certain Bulbul joins the singers, and the poem, which is far too long, ends at last in a very high-strung key. Perhaps the greatest faults of the poem are, first, that it irresistibly suggests the illuminated grotto with one ballet-girl in a boat, and a profusion of blue fire over the whole affair, a ridiculous train of ideas that cannot be too carefully avoided in an ideal work of this kind; and secondly, that the whole thing is false as a piece of criticism, the genius of Chopin being anything rather than this moonlit and sentimental emanation. The poem contains many exquisite passages, and also, it must be added, too many for which it is difficult to find any word so appropriate as "sugary."

We should, however, be giving an entirely false idea of the poetic attainment reached in this volume if we led our readers to suppose that its contents were mainly vague or intangible. There is very much here that will please even those readers for whom what is merely visionary, however musical or tender, has little charm. The opening verses of the book, dealing with the lofty function of poets in a spirit of the fullest fervour and enthusiastic faith, are particularly brilliant and original. In yet another strain, the poem of "Supreme Summer" gives exquisite utterance to a purely material and emotional sense of the delicate physical harmony of summer warmth and human passion, of clear sunny colour and exalted joyous feeling. But above all, the songs that are scattered here and there, most of them more pensive in tone than the poem just mentioned, but all delicate and subtle, give firmer proof than ever of Mr. O'Shaughnessy's clear lyrical faculty, and of the certainty that he will enrich our literature with some of the very best songs written in our generation. Indeed it would be difficult to point to any one now writing who excels him in this class of work. We quote out of many equally good, the shortest—

"I made another garden, yea,
For my new love;
I left the dead rose where it lay
And set the new above;

Why did the summer not begin?
Why did my heart not haste?
My old love came and walked therein
And laid the garden waste.

She entered with her weary smile,
Just as of old;
She looked around a little while,
And shivered at the cold;
Her passing touch was death to all,
Her passing look a blight;
She made the white rose petals fall,
And turned the red rose white.

Her pale robe, clinging to the grass,
Seemed like a snake,
That bit the grass and ground, alas!
And a sad trail did make;
She went up slowly to the gate,
And there, just as of yore,
She turned back at the last to wait
And say farewell once more."

When Mr. O'Shaughnessy is thoroughly true to his individuality he is infinitely charming. One longs to quote stanza upon stanza where it is difficult to say which is more exquisite, the technical perfection of structure and melody, or the delicate pathos of thought. He fails, however, when he passes out of his own sphere, and his failures and his successes are more decided than they were in the *Epic of Women*. For instance, none of the mystical poems in that volume approached the "Song of a Shrine," and several others in this; on the other hand, "Palm Flowers" was more successful than any of the tropical studies in *Moonlight and Music*, one of these, "Azure Islands," being quite unworthy of the poet in every way.

To sum up, this volume exhibits a change of mind, and marks a crisis in its author's poetical life. In a poem at the end of the book, "Europe," he confesses that his old love for France is gone; he has no hope for the future of its land or its literature, and he looks to a wider horizon, and wishes to embrace all Europe in his intellectual sympathy. Accordingly we find it consistent that the influences of Baudelaire and Gérard de Nerval are dropping from him, and that where they still linger, they are manifestly exotic and uncouth. A little longer, and he will exercise his poetic function without any restraint or incompleteness, we doubt not. At this moment, his growing and strengthening work is marred by the struggle it costs him to sever those early loves.

EDMUND W. GOSSE.

The History of the Common Law of Great Britain and Gaul, from the Earliest Period to the Time of English Legal Memory. By John Pym Yeatman, of Lincoln's Inn, Barrister-at-Law. (London: Stevens & Sons, 1874.)

THIS is a most extraordinary book. According to Mr. Yeatman, "so numerous, so malignant are the Lies of history, that the only safe plan to adopt is to discard everything." And this he proceeds to do by telling us "of the monstrous fignments of Sir Edward Creasy and his absurd theories;" that Mr. Spence, in his *History of the Equitable Jurisdiction of the Court of Chancery*, has failed to point out the true origin of our law; that Kemble's *Codex Diplomaticus Aevi Saxonici* "has a certain value as a guard against further discoveries;" that "We as a nation

can afford to spend something like 40,000*l.* a year in printing and propagating a senseless mass of rubbish relating to the petty wants and daily life of the obscure individuals of the last two or three centuries" (alluding, it would seem, to the publication of State papers by the Master of the Rolls), and that "it is shocking to know that, for want of knowledge, the decisions of our judges are frequently hopelessly wrong, and that property devolves upon those the least entitled to it."

In the place of the usually received accounts of the early English, Mr. Yeatman gives us his own theories "that here in England might be found the descendants of Gomer, of Tubal, of Mesech, of Javan, of Piras;" that "Solomon's temple was indebted to Britain for the brass or bronze used in its construction;" that both Homer and Virgil refer to the Druids; and the general conclusion he arrives at is "that the Saxons had neither laws nor literature."

Mr. Yeatman says his object in writing this book was to call the attention of French lawyers to the common origin of our laws and their own . . . and that we may learn from their labours what we are too indolent to obtain from our own. Mr. Yeatman should speak for himself; but we cannot, either for the sake of Mr. Yeatman or for the sake of English legal scholarship, share the hope that this book will fall into the hands of French lawyers.

While we differ so widely from most of Mr. Yeatman's statements, we are glad to find that there is one in which we can most cordially agree—that his work is "boldly begun and feebly executed."

J. W. WILLIS BUND.

Meeting the Sun: A Journey all round the World. By William Simpson, F.R.G.S., &c. (London: Longmans & Co., 1874.)

It will, doubtless, be remembered that in 1872 Mr. Simpson went out to the East "as a kind of double-barrelled correspondent" (to quote his own expression), with the view of "seeing the ceremonies of the Emperor of China's marriage," and reporting the same for the *Illustrated London News* and the *Daily News*. Of that journey this book is the result. In his introductory chapter Mr. Simpson in some measure disarms the critic by owning to a consciousness that his book is "more or less like a stuffed bird," and this really appears to us to be the actual state of the case, though, perhaps, not quite in the way that he would have us to understand his phrase. The volume before us is undoubtedly interesting in many respects, but it contains far too much padding and too many ancient reminiscences; very often too there is a certain flippancy in the way of putting things which grates disagreeably on one's feelings.

The first quarter of the book records the writer's journey from London to Hong Kong, by the new route, viâ Venice and Brindisi. We have, of course, a repetition of the oft-told tale of the trip in a mail steamer down the Red Sea, with regard to which Mr. Simpson gives us a startling piece of information. Speaking of the passengers sleeping on deck at night, he says: "We all come up in pyjamas; any further covering would

be *un peu de trop* in such a climate." The last time we ourselves passed through the Red Sea, sleeping jackets in addition were decidedly *de rigueur*; but times are changed, we suppose.

As the Imperial marriage was appointed to take place on October 16, Mr. Simpson could only stop two days in Hong Kong, which, perhaps, was rather a fortunate thing for his readers, as otherwise we should probably have had a long digression about Canton and our former wars with China. Passing up the Yellow Sea to Shanghai, our author takes a strong and not unnatural dislike to its turbid waters, and tells us of the saying, attributed to a Yankee, "Call that water? Why, it's more like what we make bricks with in our parts." After spending forty-eight hours at Shanghai, Mr. Simpson hurried on to Tientsing, where he made his first acquaintance with Chinese life, properly so called. Beggars are an unpleasantly prominent feature in a Chinese city, and Mr. Simpson's remarks about them are perfectly correct and quite within the mark. "Chinese beggars," he writes, "are notorious for their efforts to excite charity."

"They exhibit sores and deformities, stick pins and bits of wood into their flesh, and burn joss-sticks on their hands and arms, but in most cases these are tricks. They can put clay on their arms and paint it to look like a swollen sore; and it is by a similar process that they can afford to, or rather seem to put pieces of wood into their flesh."

It must have been trying to the feelings of a Special Correspondent, who "had come all the way from London," to be told on his arrival at Peking that "as to asking permission to see any of the [Imperial marriage] ceremonies, that was quite out of the question"! By the aid of kind friends, however, he did contrive, as we all know, to get a stolen glimpse of the midnight procession of the bride to the Imperial palace, and, from hearsay, he gives much interesting information on various points relating to the marriage; and this marriage was more than ordinarily attractive, as the last case of an Emperor being married after he came to the throne occurred in 1674.

Though Mr. Simpson is not able to tell us much from personal observation about the main object of his mission, he gives a fairly accurate account of Peking and many matters of interest connected with it, including the far-famed Temple of Heaven, to which he devotes a separate chapter. "The study of temples has always had a fascination for" him, and in China he had good opportunities for pursuing his studies under able guidance. Whilst at Peking he made an excursion to the Summer Palace (Yüan-ming-yüan), to the Ming Tombs, and, as he believes, to the Great Wall of China. He seems, however, only to have got to what may be termed the inner wall, which was repaired some two centuries ago. We have been over the same ground ourselves, and we certainly did not consider that we had seen the Great Wall of China until we had travelled about a hundred miles further in a north-westerly direction than our author did; we struck it at the frontier town of Chang-chia-kow (Kalgan), about a hundred and fifty miles from Peking,

and found it, with the exception of the gateway, in a remarkably dilapidated state.

Mr. Simpson devotes a long chapter to Literature and Education in China. The Examination Hall at Peking, with its 10,000 small cells, seems to have caused him some surprise, but we do not think he brought away with him any very clear ideas respecting the literary system of the country. In Europe it is generally believed that Chinese women are uneducated, so we are glad to learn from Mr. Simpson that "culture among them is not uncommon," and that he himself met an old lady (the widow of an official) who "supported herself by teaching the daughters of the people of the better class at Peking." This, as he says, "is an evidence that female education is not altogether neglected in China. In this respect China clearly stands high above the rest of the Oriental world." A portion of this chapter appeared in *Macmillan's Magazine* for November last—Mr. Simpson omits to mention this fact—under the somewhat pretentious title of "China's Future Place in Philology," and with reference to this we propose to make some remarks, for the theory propounded and the conclusions arrived at are decidedly startling. Mr. Simpson tells us that his purpose is "to suggest probabilities as to the future forms of speech among the Celestials." He ingenuously admits that "he was only a traveller for a few months in China," and that (cf. p. 158) he "knew not a word" of the language himself; evidently, therefore, he is eminently well qualified for the task which he has set himself. He commences by expressing an opinion that

no one who knows China, and is acquainted with the powers and influence of Westerns in the East, will doubt that we shall not only maintain the position we have acquired, but that most probably that position will become stronger; that new ports will be opened, and our relations with the people become more intimate and powerful than ever.

There is certainly not much harm in granting this, though we rather demur to the new ports, as we cannot see the necessity for them; that, however, is a matter into which we cannot here enter. Taking his assumption as granted, Mr. Simpson proposes to "consider what will be the future of that strange jargon known as 'Pigeon English'"—we prefer ourselves to call it "Pidgin English," as the word "Pigeon" has too innocent a look about it, and the expression, be it remarked, is merely a corruption of "business"—and he is seemingly of opinion that this is the language (!) of the future.

Before proceeding any further with Mr. Simpson's remarks, we venture to quote a brief description of this Pidgin English by a gentleman whose experience of China and the Chinese extends over more than thirty-three years:—

"The language," says Mr. W. H. Medhurst, Her Majesty's Consul at Shanghai, "... is a jargon made up of English, Portuguese, Chinese, and Malay words, tortured into unrecognisable shapes and constructions, and it is little fitted to sustain any conversation beyond what appertains to the mere technicalities of trade."—*The Foreigner in Far Cathay*, p. 29. (London: Stanford, 1872.)

Truly, this is a promising foundation for the future language of four hundred millions of the human race!

Mr. Simpson goes on to say that the newest and most important feature of all is that the Chinese generally are now adopting this language among themselves as a means of communication, and that this is owing to the fact that men of different provinces cannot understand each other's dialect. To both these statements we object *in toto*. It is preposterous to say that men of different provinces cannot understand each other's dialect, though we are prepared to grant that they sometimes have a difficulty in doing so, and that occasionally a couple of coolies—natives, perhaps, of widely distant parts of the Empire, who happen to have picked up some Pidgin English in the service of foreigners, may find it convenient to converse in that jargon; in fact, such instances have come under our own observation, but we do not admit that it can, therefore, be argued that the Chinese are adopting the language. Mr. Simpson seems entirely to lose sight of the vastness of the Chinese Empire, and, we fear, can know absolutely nothing of the character of the educated Chinese, or he would never have ventured upon such an assertion. Any one who is acquainted with China knows that the use of Pidgin English is almost entirely confined to the ports open to foreign trade, and the population of all these ports put together does not exceed five millions, of which number only a comparatively small portion know anything at all about the jargon. What Mr. Simpson means by the "written Mandarin character, which can be read and understood all over China," we cannot pretend to say, though we had once some acquaintance with what is known as the Mandarin dialect; and we were under the impression that the Chinese characters were the same for all dialects. To turn to Mr. Simpson's specimens of Pidgin English—with regard to "piecey," if he had only known something of Chinese grammar, this word would not have been such a thorn in his side. Clearly he knows nothing of the mysteries of distinctive numeral particles, significant numeratives, classifiers, and the like. To give an example, a Chinaman does not say, "a pencil," but "one branch pencil," and it is owing to this peculiarity of the Chinese idiom, we believe, that the word "piecey" has come into use in Pidgin English. Again, has Mr. Simpson ever heard a Chinaman pronounce the word "Emperor"? We venture to assert that not one Chinaman in ten thousand (to be within the mark) can do so.

Passing over some minor inaccuracies as to Pidgin English, we are fain to confess that we are puzzled to understand how Mr. Simpson knew that his servant told some country people that *Chow-chow* was English for *food*. Obviously his servant could not have been talking Pidgin English, for Mr. Simpson does not tell us that the jargon has at present penetrated into the interior; and if it had, the information would have been superfluous. All things considered, surely it is premature to look upon Pidgin English as the language of the future in the Celestial empire.

In his speculations—which often make us smile—Mr. Simpson has overlooked one most important fact, viz. that the study of the Chinese colloquial speech is spreading

rapidly, as people begin to find out that its difficulties have been much exaggerated. No one on the numerous staffs of the Chinese Maritime Customs and the British Consular Service can nowadays hope for advancement unless he has a fair knowledge of the Mandarin dialect; and many men also in mercantile houses are now keenly alive to the necessity of acquiring at least a smattering of the language of the people amongst whom their lot is temporarily cast.

We are almost tempted to think that Mr. Simpson propounded his theory in order to have an excuse for introducing the ridiculous parody of "Excelsior," of which some unkind friend inconsiderately made him a present during his brief sojourn in China; and in quitting this subject we would earnestly recommend special correspondents who may hereafter have occasion to visit the Far East to bear in mind the old adage, *Ne sutor ultra crepidam*.

On his return to Shanghai from the North, Mr. Simpson made a trip up the Yang-tze kiang as far as Hankow in one of the magnificent American river steamers which ply regularly between the two ports. We must mention that he is mistaken as to the meaning of "Yang-tze;" the characters, as they are usually written, do not mean "Son of the Ocean," and the Chinese living on its banks rarely speak of it by any other term than *kiang* or *ta kiang*; or rather, to be strictly accurate, they say *chiang*. Mr. Simpson is also in error when he says that the word *kiang* "has no other signification beyond its connexion with this stream;" evidently he has never heard of the Choo kiang at Canton, the Han kiang at Swatow, and the Min kiang at Foochow, nor can any one have explained to him the meaning of "Kiu-kiang," the name of the Treaty port at which he stopped, about one hundred and forty miles before reaching Hankow. Our author was much impressed with the appearance of the British settlement at Hankow, which we may mention was laid out in more prosperous days than the present; had he gone there ten years sooner, he would have seen no "magnificent band," and not a single "palatial residence." On his way down the river, Mr. Simpson stopped at Nanking, and saw the Arsenal, which, if we remember rightly, was established, under foreign superintendence, by the famous Li Hung-chang. Then, taking the steamer to Chinkiang, he returned to Shanghai by the Grand Canal, in what is called a "house-boat"—a very comfortable way of travelling. This Canal, he says, is a grand work, but he makes a mistake about its Chinese name; the natives call it *Yün-liang ho* (i.e. transport grain river), or simply *Yün ho*. We take this opportunity of remarking that Mr. Simpson would have done well if he had got the proof-sheets of that part of his work which relates to China revised by some one who had a slight acquaintance with the Chinese language, &c., as he would thereby have avoided several curious mistakes, of which we have only pointed out a few of the more important.

After finally quitting Shanghai, our author spent a month in Japan, and he speaks highly of the rapid progress which is being made in that country, and which was all the

more striking to him, as he had recently heard so much of the obstructiveness of the Chinese, amongst whom, he says, "everything seems to have been frozen up for thousands of years." Of the changes now taking place in Japan, one of the most strange must be the adoption, or partial adoption, by the natives of "the European articles of costume," and we can quite believe that they "present in many cases rather a hybrid appearance." Mr. Simpson made a walking tour into the interior of the country, which seems to have afforded him much pleasure; and he tells us of an important discovery which has been recently made respecting the tomb of Will Adams, an English pilot, who lived in Japan in the time of Elizabeth and James the First. We must protest against the Japanese being spoken of as the "Japs;" such an expression is all very well over a glass of sherry in the Yokohama Club, but it is decidedly out of place in a book of travel.

From Japan Mr. Simpson crossed over to San Francisco in one of the large steamers of the Pacific Mail line. The voyage occupied twenty-six days, and in fine weather it is a pleasant trip, but in case of storms or accidents to machinery the position of the ships would be very dangerous, from their having very few sails and no port of refuge, for "islands on the way are doubtful."

Being in the "Golden City" when the news of the Modoc troubles arrived, Mr. Simpson "determined to make for the locality;" but the letters which he wrote from it will be so fresh in the recollection of the reader that they need no further allusion here. He next paid brief visits to the Yosemite Valley and Salt Lake City, where he was much struck with the willingness of the Mormons to answer questions or render a service. On his way to New York, Mr. Simpson stopped to see the Mammoth Caves of Kentucky, which were first discovered in 1809, and are no doubt well worth a visit.

In taking leave of this volume, we must not omit to mention that it contains, as stated on the title-page, "numerous heliotype and other illustrations" (reproduced from the *Illustrated London News*), which, so far as we are acquainted with the scenes represented, appear to be very good.

EDW. DUFFIELD JONES.

The French Humourists from the Twelfth to the Nineteenth Century. By Walter Besant, M.A. (London: Bentley & Son, 1873.)

CRITICISM may occupy itself with bringing familiar works into new relations, and under new lights; or it may discover and display forgotten treasures; or it may become something very like gossip, and prattle literary anecdote. Mr. Besant attempts all these three things, and only with very partial success. In writing of French humourists, he begins with such *chansons* as Bartsch has published in his *Alt-Französische Romanzen und Pastourelles*. To write well on these would really be to cut and reset some exquisite gems of a unique formation, songs composed when the *Volks-lied* was just becoming artistic. They have the sweetness of the ballad, with more of conscious style, and deal delicately with the themes of old folksong. Mr. Besant has tried to translate two

of these, but he has not preserved the simple structure of the verse, and in "*La Belle Doette*" he has omitted the last stanza, which tells how the lady built an abbey to receive all the wounded men and maidens who fell out of the ranks, in the great mediæval tourney of Love:

"Toz cels et celes voudra dedanz atraire
Qui por amor sevent peine et mal traire."

This lyric is as far as possible from being humorous, and Mr. Besant might have found among the *chansons* of the thirteenth century many such gay *pastourelles* about *bergères moqueuses*, as M. de Puymaigre collected from recitation in the neighbourhood of Metz. These would have well displayed the native *malice* of the Frenchman. Coming from poems little known, to matters familiar to all students of French, it is impossible to say that Mr. Besant does anything to increase knowledge, or clear up difficulties. There is all the usual vagueness in what he says about *trouvères* and *jongleurs*, a subject which needs to be treated with patience and detail, if it is to be treated profitably at all. And it is useless to write in a popular way about the "*Romance of the Rose*." The book is full of information on mediæval learning and ways of life and thought; and, especially in the second part, is remarkable for the statement of social views like those which Amaury de Bene and David de Dinant held, and which were not unknown among the Franciscans. These views, we are happy to be able to inform Mr. Besant, were both "the speculations of a dreamer, and the tenets of a school," a school with a metaphysical basis of its own invention. The interest of the "*Romance of the Rose*" is historical; considered as a Garden of Delight, or a Paradise of Wit, its gates have long been closed, and of all its inmates *Ennui* alone remains guarding the portals. Mr. Besant complains that Mr. Wright is dreary on these subjects, and he tries his best to be gay, but the task is too much, and he is tedious. Indeed, it is impossible to see the use of criticisms on such themes as Eustache Deschamps, Rabelais, and Montagne, which can teach nothing to anyone who knows these writers, and which are not written with such detail as to make them instructive to minds still lying in darkness. It would be a work of immense labour to describe the kinds of society, with all their changes and varying fashions, which existed in France between the twelfth and sixteenth centuries. In Mr. Besant's book there is a great break, for he has written of Villon, of Marot, and of Pathelin in another work. As we read we find humourist after humourist surrounded by and satirising a crowd of priests and women; but how the foibles and ways of priests and women changed through these ages, we hardly learn at all. Thus the work is unsatisfying while it attempts to deal with subjects at all remote, and it only improves as it draws nearer the region of literary gossip. Mr. Besant attempts very successfully to popularise the life of St. Amant, of Boileau, and of Molière, and gossips about Voiture and Benserade; and this he does with complete success, this part of his book being thoroughly readable by the class of readers to whom it seems to be addressed.

The people whom he offers to "lead through ways perhaps untrodden, among fields yet unvisited by you;" the people who "picture Rabelais to themselves as a jovial priest, who mumbles a mass and bawls a drinking song," will find themselves, by Molière's date, among names they have heard before, and in scenes not quite unfamiliar. So no fault can be found with Mr. Besant for not writing a criticism of Molière's genius, which would not interest his readers. It is only to be regretted that he should have wasted his space and thrown away the ease of his style in the hopeless attempt to extract amusement from the "*Romance of the Rose*," and to galvanise into life gossip about Rutebeuf.

Once fairly launched in the *salons*, he can offer his public what he, like Goethe, says they like, "the easy wanderings of a mind of their own level." It may be said that his wanderings are not only easy, but sometimes a little free, as when he speaks of that "immeasurably worthless scamp Henri III.," and of his own "very dear and especial friends, François Villon and Clement Marot." Villon would probably be not a little surprised at so intimate an acquaintance classing him with Herrick, Gay, and Moore, among "gaudy and brilliant-winged creatures." The lover of *La grosse Margot*, like the chrysalis in the sermon, "never, in his wildest moments, dreamed of being a butterfly." This tone of familiarity is undoubtedly that which the public expects, in a book which is not to be dry and learned. It seems almost impossible in England to write such literary essays as find readers in France. But it is a pity that Mr. Besant should not have tried to educate his public a little, instead of sinking to the level of the daily papers. That he has both the learning and the ability to do this is not doubtful. He has preferred to add, as Mr. Arnold might say, another bubble to the vague Mississippi of general information, and to gossip, lightly and amusingly, of the wits of later times. He can, when he chooses, write sentences as lucid, as happy as this about the want felt in Béranger, the want which alienated Sainte-Beuve:—

"Where the crowd is thickest, there is Béranger: where the tide is flowing, thither drifts his barque with all the rest; amid the crowd we find their prophet; we look for the voice of a man, and we hear the voice of the multitude."

He detects the keynote of French poetry, "the intense love of life;" and it is true that in England "we have agreed not to harp upon the great human sorrow, or at least to strike the chord indirectly 'in thinking of the days that are no more.'" It is this chord, however, that is the ground-tone of the *Earthly Paradise*. One would like to quote the description of satire in mediæval life, present everywhere, like Death in the *Danse Macabre*.

Of the translations, which are numerous, often facile, often too free, that in which the philosophy of Gilles Durant is sung, seems the best:

"We live from day to day, my friend,
And not from year to year."

Mr. Besant has carefully written this book down, down to what he believes to be the level of the general reader. It is to be hoped that some day he will use his knowledge more seriously, on subjects which can never

be popular, but it would be a loss to the reader aforesaid, if he gave up gossiping now and then on themes that lend themselves to gossip.

A. LANG.

History of Two Queens. By W. Hepworth Dixon. In Four Volumes. (London: Hurst & Blackett, 1874.)

MR. DIXON has now completed the history of "two crowned and starless women," of which the first two volumes appeared last spring. In writing the lives of Catharine of Arragon and Anne Boleyn, he has enjoyed an immense advantage over all previous historians, not merely because he has been able to use their labours as the foundation for his own structure, but because many more sources of information are now open to the student of history. The researches of Mr. Bergenroth and Mr. Brown, at Simancas and Venice, during the last few years, have laid open to us a new store of contemporary evidence for the period of which Mr. Dixon treats. We fear, however, that the author's appetite for novelty has led him to place too much reliance on the reports of the Imperial and Venetian ambassadors, forgetting that the former were too ardent partisans of the Spanish and Papal power to be impartial; and also that the insular dislike of foreigners, and the great difference in manners and language between England and Continental nations tended to prevent foreigners from really understanding the character and proceedings of our forefathers.

Commencing with the birth of Catharine in Spain, Mr. Dixon describes with his usual graphic power the reign of Ferdinand and Isabella, their unscrupulous endeavours to unite the kingdoms of Spain under one crown, and their holy war against the Moors of Granada. After Catharine's marriage the scene is laid principally in England, and the reader is led step by step through the vicissitudes of her life—the brief honeymoon after her first wedding; her dreary widowhood, when she seemed to have no support or sympathy except from her own servants, and when her father considered her merely as a means of gaining his own ends; and her shortlived revival of happiness with her second husband, so soon followed by a period of unhappiness, worse perhaps than what she had before experienced. The life of Anne Boleyn is so closely linked with the latter portion of that of Catharine, that the two run, as it were, parallel, till the scene is closed by the death of one at Kimbolton, and of the other at the Tower. As the history of the period is doubtless familiar to our readers, it is unnecessary to give a detailed account of the substance of the book here, and more to the purpose to discuss one or two special points.

Of the first two volumes it is needless to say much, as they have been for some time before the public. Mr. Dixon is determined to take advantage of every opportunity of supporting a paradox, however untenable it may seem to the less imaginative student of history. The first volume, for instance, contains a very interesting account of the adventures of Perkin Warbeck, whose claims are cleverly advocated, chiefly in consequence of the

discrepancy between the accounts of his parentage which were current at the time. That such a discrepancy should have existed was only natural; but the confession which was printed by order of Henry VII. contains a minute account of his whole life, and of facts which must have been well known to English merchants, and easily disproved if untrue. There is no proof, either, that any one who had any personal knowledge of the family of Edward IV. ever put any faith in his pretensions.

Another paradox is the assertion that Anne Boleyn was older than her sister Mary, but as this was discussed in a recent number, there is no need to enter into the question again here. Before proceeding further, however, it will be as well to mention the position which Mr. Dixon takes in regard to the most controverted points of the history. As to Catharine's divorce, he believes that her marriage with Henry had always been considered by a large party in England as unlawful; and as to Anne Boleyn, he does his best to prove her innocent of the crimes laid to her charge.

The following passage gives, not only a key to Mr. Dixon's version of the "King's great cause," but also his explanation how the acceptance by Anne Boleyn of such a questionable position as successor to a wife who was still alive, was compatible with her moral excellence. As early as the year 1514

"Anne Boleyn could not help but hear the people in her circle talk about these matters in connexion with the Queen, whom they regarded as a concubine and not as a wife. It was a singular thing for such a child to hear. In all the army of her kinsfolk there was hardly one, except her peevish aunt, Elizabeth Stafford, who professed to be a friend of Spain, an advocate of the Papal bull, or an indulgent critic of the Queen. People were talking freely of the time when Henry would put away that concubine and take to himself a lawful wife. Already they were seeking for a lady who might occupy her vacant place. . . . At thirteen years of age the innocent child from Hever, who had spent her days with flowers and books, her fancies bounded by a moat and garden, had to hear those questions argued in the heat of a great party house. An image was impressed on her that never left her mind in after years. Catharine was presented to her young imagination as a worldly woman, who for worldly gain was sacrificing her repute, relying on a bull which no one out of Spain believed a pope had any power to grant. How could this child have any other feeling than commiseration for a queen who, of her own free choice and for a worldly purpose, was persisting in a mortal sin?"

No attempt is made to reconcile the statement that no one out of Spain believed in the Papal power, with the wholesale bribery and intimidation which the King was obliged to use in order to obtain opinions in his favour from the English Universities. Catharine was by no means the only person in England who thought the accusation of worldliness and mortal sin more applicable to Anne than to herself. Anne, however, appears as the heroine of the story. Though Mr. Dixon does not give her credit for "more physical beauty than may lodge in a pair of brilliant eyes," he endows her with "all the feminine learning of the day, an ear for wit and song, a taste for art and music, a regard for learning, and a love of

intellectual gifts." As an example of her accomplishments, a translation is inserted of a letter written by her to her father in French. Mr. Dixon places this in 1514, when, according to his chronology, she was fourteen years of age; but, if his translation is correct, the date must be at least two years earlier. She writes: "If this note is badly written, please excuse me. It is all my own—the spelling out of my own head, while all the other notes were written by mamma." Lady Boleyn died in 1512. However, on looking at the letter as printed in Mr. Brewer's *Calendar of State Papers*, we find that the last sentence runs thus: "Les autres ne sont faiz que escript de maman;" which clearly means: "The others are not composed, only written, *by my hand*." The reader will understand that Anne Boleyn's spelling is of the very worst description, and hardly bears out Mr. Dixon's account of her accomplishments. The sense is often not nearly so clear as in this passage.

The fourth volume is principally occupied with the fruitless attempts of Henry VIII. to procure a sentence from Rome annulling his marriage with Catharine. The Spanish papers, of which Mr. Dixon has made so much use, throw fresh light on the Imperial influence which prevented the Pope from acceding to the king's wishes; but his account of the final passing of the sentence by Archbishop Cranmer requires a few words of comment:—

"Four bishops (writes Mr. Dixon) rode with Cranmer to the priory of Dunstable, in the chapel of which priory he held his court. Catharine was at Amptill, four miles off, and Bryan rode across to serve her with a notice to attend. She paid no heed to his citation. Bryan proved the service, and as no one answered for 'Lady Catharine,' she was declared contumacious and the court was closed. Eleven days later Cranmer pronounced a final judgment of the English Church."

This is perfectly correct as far as it goes. Catharine was summoned and refused to appear, but Cranmer himself, in a letter which is still extant, written during the above-mentioned "eleven days," begs Cromwell to keep the matter secret, because if Catharine hears that sentence is to be given, and is persuaded to appear before him, he would be greatly hindered in the process, and the Council would be uncertain what course to pursue. In fact, the sentence was pronounced against her on the ground of her contumacy, without giving her a chance of being present at the court; and though she had refused to appear before an English court, and thus countenance a jurisdiction against which she had protested as partial, Cranmer's letter shows that there was a probability of her appearing, if she had known that the case would be determined. Whether Mr. Dixon saw this letter of course we cannot say, but the volume in which it at present exists appears several times among his authorities. We may mention in passing, among the defects of the book, that despatches are too often quoted in the list of references without any indication either of the collection to which they belong, or of the books in which they are printed. Too much reliance also is, we think, placed on such books as Wyatt's *Life of Anne Boleyn*, Foxe's *Acts and Monuments*, and Leti's *Life*

of *Elizabeth*, which were written at a time when men's minds had been so influenced by the struggle between the old and the new faiths, that even the past was coloured by their prejudices.

A tone of scrupulous accuracy is given to the book by the author's habit of using the native names of foreigners, even when they are better known in English history under another form. Thus, Catharine is usually called "Catalina," and Ferdinand of Arragon "Fernando." Love of accuracy, however, can hardly account for another eccentricity of nomenclature; or perhaps the author thinks that an impression of intimate acquaintance with the actors of his story is conveyed by calling the Dean of Wells "Tom Winter," the Duke of Suffolk "the joustier," Sir Francis Bryan "Frank," and even the Emperor himself plain "Max." But his want of familiarity with the period of which he writes is betrayed by little indications like the following:—Parliament is said to have passed Acts "against escheators, perjurers, informers, and receivers," as if an escheator was a criminal instead of being an officer appointed by the Crown. The Act in question is really directed against escheators giving false returns. The most ardent supporter of Papal authority in England would have been surprised to hear that Henry VII. "put his kingdom under Cardinal della Rovere's feet" when he appointed him Protector of England. The appointment merely gave the Cardinal power to transact ecclesiastical business in the Court of Rome which did not require the intervention of an ambassador. In fact, the Cardinal Protector was merely the solicitor for England in the Roman Court. However, to those who read history for amusement, these faults will not in any way affect the interest of the book, which is sustained throughout by the graphic narration of events and spirited descriptions of persons and places, for which the name of the author is a sufficient guarantee.

C. TRICE MARTIN.

NEW NOVELS.

Judith Gwynne. By Lisle Carr. (London: H. S. King & Co., 1874.)

Young Mr. Nightingale. By Dutton Cooke. (London: Sampson Low & Co., 1874.)

Once and for Ever. By the Author of "No Appeal." (London: Tinsley Brothers, 1874.)

The Mystery of Ashleigh Manor. By Eliza Rhyl Davies. (London: Bentley & Son, 1874.)

ALFRED DE MUSSET, if we remember rightly, once took it into his head to maintain that the often disputed difference between the classic and romantic schools consisted in the more or less liberal employment of adjectives. If this position (which De Musset supported by mischievous amplifications of passages from *Paul et Virginie*, &c., in his proposed romantic style) be correct, the author of *Judith Gwynne* must be a distinguished proficient in romantic art. Here is a specimen of his sentences:—"There were odd times and seasons when her great passionate heart throbbled with most unchristian-like pulsa-

tion, and when maddened by disappointment, wasted love, and universal discontent, she felt as if she must recall the man whom she had driven away all too hastily—yes, recall him, be the awful consequences what they might!" It would not take long, we think, to reverse De Musset's proceeding, and reduce this sentence to its simplest terms. Or again:—"The promenades, picture galleries, morning concerts, flower shows, and other carefully organized and admirably got up hypocrisies with which good society veils its Mocanna-like visage of hideous despair." Here the grandiosity of the image—Society veiling its face with a carefully organized picture gallery—sets ordinary criticism at defiance. We feel it more within our sphere to object to a young lady who, writing to a rejected but regretted admirer who has been reported to have taken to evil courses, asks him "if there is any worthiness in being the bellicose Bayard of riots in the streets, or the Crichton of the card table?" This compound of Dr. Johnson and Mrs. Chapone is none other than Judith Gwynne, the heroine, a divine and lovely governess with a "glint" in her eyes and a "keckle" in her voice. First she glints and keckles at a wicked Colonel Wilmot, then at a virtuous country lawyer, Tom Framleigh. How the latter saves her life in a fire—how he proposes, is rejected, and retires in despair to London—how the wicked Colonel introduces him (unsuccessfully) to the before-mentioned evil courses, and to a too fascinating actress, Lina St. Clair—how Judith comes into a great fortune, and finally, despite the Colonel's machinations, marries Framleigh—may be read by anyone who chooses; but we cannot conscientiously recommend the reading. Mr. Lisle Carr has either very little idea of character, or is quite unable to express it: his dialogue is tedious and unnatural; plot he, perhaps luckily, hardly attempts. Nevertheless there are here and there glimmerings in him; and if he will ration himself strictly in the matter of adjectives, eschew *tanquam scopulum* set speeches and elaborate sarcasms, and pay a good deal more attention to the keeping of his characters, he may one day write a tolerable novel. Meanwhile, we fear that the announcement "first edition" on the title-page of *Judith Gwynne* is rash, for, as Mr. Carr himself tells us (vol. ii. p. 252), "a first presupposes a second."

Young Mr. Nightingale does not require any repetition of the simple cautions which we have ventured to address to Mr. Carr. Its author is quite aware of most of the minor elementary rules of his business. Indeed, the first volume is very definitely and positively good—so good that, had the book ended here as a fragment, all readers would have been justly disappointed and expectant. The hero is an only son, living with his mother and uncle (his father being dead, or at any rate missing) at a remote Wiltshire farm. His youth and education (the latter isolating him still more, as being superior to that of his neighbours) are thoroughly well described, as are also the farm-servants and general surroundings. A mysterious and debauched lord, a beautiful rope-dancer, and a strolling actor, make occasional appearance with due effect.

When the first volume closes with the hero's arrival in London to start in life, one shuts it in comfortable satisfaction with book and author. Unluckily the second and third volumes by no means carry out the promise of the first. The subordination of the hero is in the first volume quite right and proper, afterwards it becomes a bore. He does nothing particular, and this nothing particular is done in a very uninteresting way. Nothing at all can fairly be said to happen. Young Mr. Nightingale certainly discovers old Mr.—or, as he is now, Sir George—Nightingale, and so brings to a *dénouement* what little plot there is. He also marries a young lady at the end of the book, but there is no interest whatever in the course of their loves, and indeed there is very little said about it. Of Rosetta, the dancer, the most promising figure in the whole book, nothing is made. Mauleverer, or Mole, the actor, has evidently had most trouble taken with him, and the result is not bad, but it can hardly be said to be good. Like every one else, he sits remarkably loose to the general purport of the book. Now it need scarcely be said that one of the most marked differences between a good and a bad novelist is this, that the former makes all his characters conduce in some way to the setting forth of his story, whereas the latter introduces and drops them without any sufficient reason at all. Another serious drawback remains to be noticed, and that is the reminiscences of Dickens which crowd the book, and especially the second volume. The hero is a colourless cross between David Copperfield and Pip; his friend Tony Wray is equally indebted to Traddles and Herbert Pocket; Rachel Monck and her invisible father are Mr. Wingfield and Agnes, while careful analysis would trace the same origin in many of the minor characters and incidents. This is the more to be regretted, in that Mr. Dutton Cook is too good for an imitator. He has avoided his model's two great defects of caricature and sham pathos, and we cannot but think him strong enough to add to his good gifts of description and expression, something better than a second-hand set of characters for these gifts to work upon.

We have very seldom read any book constructed on principles so extraordinary as those which seem to have guided the author of *Once and for Ever*. The chronology of the book is perfectly bewildering. For instance, the hero receives a letter from a friend, alluding to glorious news from the Crimea. This fixes the date at the end of 1854. Some time afterwards the hero marries, a daughter is born, and married in her turn at twenty years of age, her children are born and comfort their grandfather; he dies at last, and this book is written from his posthumous papers; so that, as far as we can make out, we must be writing this present review in the year 1890 or thereabouts. No further specimen need be given, we think, of the extraordinary carelessnesses and incongruities which may be found in *Once and for Ever*. The whole story is managed without the least regard to the fitness of things. The first two volumes drag their slow length with hardly an incident of importance.

Suddenly, in the third, the author begins to "feel his stretcher," and the hero in a couple of hundred pages marries, mysteriously loses his wife, finds her, witnesses her death, marries again, loses his second wife by drowning with complications, sees his children's children, and finally dies—somewhat exhausted we should think. In the course of his life he writes for magazines, and we are treated to one of his articles at length. It is a stupid piece of facetiousness, called *Our Cousins in the Zoo*, and refutes Mr. Darwin, who is called Hoskins. But the funny man of the book is the hero's friend Mr. Gresley, who divides his time, apparently, between writing Latin verses and jocular letters, both of which are given in full. The letters are better than the verses. At the outset of the novel the author—at least, the author's autobiographic curate—says that the reader "must give him credit for doing his best to amuse and interest, even if he sometimes fail." This is, of course, the reader's business, and not ours. If he is amused or interested, he must be in the same happy condition as the friends of Mr. Peter Magnus.

In *The Mystery of Ashleigh Manor* we have a book of a very different kind. It is the autobiography of a governess; indeed, it would almost seem that a Wellerian sufficient reason might be discovered for the existence of governesses: for what would novelists do without them? Kate Malcolmson, the governess in question, goes to live at Ashleigh Manor. Her employer, Mrs. Merton, is a singularly diabolical female, and makes herself almost equally obnoxious to her servants, her child, and her husband. The latter is a cynical and sententious person, who indulges in much talk of a symbolical nature. After a more than usually scandalous outbreak of temper on Mrs. Merton's part, vented impartially on the governess, the master of the house, and an unfortunate *soubrette*, Jane Wakefield, the household are horrified by discovering their mistress murdered in her bed next morning. It should be mentioned that the governess has, overnight, informed Mr. Merton of a very questionable interview which she has accidentally witnessed, between Mrs. Merton and a certain Captain Fowler, and that Mr. Merton and his wife do not usually occupy the same room. After investigation, the murder is laid to the account of Jane Wakefield, the maid, who has mysteriously disappeared. Otherwise things go on as before, except that a portion of the house, which is large and rambling and has its due ghost-story, is shut up. The child Laura dies not long after her mother; the widower, after a spirited chase of him by a certain Lady Callender for the benefit of her daughter, marries Kate Malcolmson. But the melancholy which has been upon him since his first wife's death only deepens. Finally he commits suicide, leaving a paper which explains the mystery of Ashleigh. It will be seen that the argument has something of the raw-head-and-bloody-bones in it. And it cannot be denied that unpleasant similarities to *Jane Eyre* occur oftener than could be wished. Moreover there is need of more diversity in the story and the characters; we are kept within the four walls of Ashleigh Manor, and to the

society of the governess and Mr. Merton, till we begin to gasp a little. But these defects can by no means blind us to the merits of the book. The characters, few as they are, are firmly drawn and well filled up; the dialogue, or monologue rather, if excessive, is of a high order, and the book is written throughout with care and finish. It is never safe to speak positively of a first book, because comparison only will show a writer's real merit. But if this be a first book, as we suppose it is, we can fairly pronounce it to be one of the most promising we have seen for many a day, and we hope that Miss Davies will—not too soon—give us another still better.

GEORGE SAINTSBURY.

CURRENT THEOLOGY.*

MR. CAPES' *To Rome and Back* is something between a religious novel, a "History of my Religious Opinions," and a treatise on the grounds of religious belief. The second element is that for the sake of which the book was composed, and is the only one that excites more interest than disappointment. The narrative sections are unequal. The best part (the Oxford scenes) would have been good if developed into a real novel, but now presents us with discussions that lead to nothing, except the knowledge that the questions discussed were open; and the clerical meeting in chapter X. is no better than an extravaganza. But when the really autobiographical part is once reached, the story is told lucidly enough; and the history of an intelligent mind is well worth telling, even when, like that here portrayed, it is far from being a representative one, for the author-hero is always at heart out of sympathy with the tendency whose result he appropriates. While an Anglican, he does not seem to have felt, though he sympathised with, the intense sense of sin which, more austere than that of the contemporary Evangelicals, refused to accept the heart's own assurance of forgiveness; and he never saw the fitness of the sacramental system in the enlarged sense in which Dr. Newman explains it, since he can trace no connexion between the poetical and the theological elements in Keble. He became a Romanist, indeed, on nearly the ordinary grounds—the demand for an infallible guide as a necessary corollary to a revelation, and the belief on historical grounds that the Roman Church represents the Nicene more nearly than the Anglican; while these arguments were brought up to the point of personal conviction, by experience of the extreme divergencies of theological opinion among the English clergy, and by the attraction of the Roman ideal of worship, which finds scope for the aesthetic and sentimental part of man as well as for the pure intellect and the rational affections. But, even when a Romanist, he seems to have held as self-evident the Protestant canon that every doctrine of the Christian faith must be a "conclusion drawn from the words of the New Testament," and therefore felt that none "could possibly be more certain than the" historical, not mathematically demon-

strative, "proof on which the New Testament itself rested." Holding this, it is not wonderful that he came ultimately to the conclusion that, though the Roman Church represents the Nicene better than the English, the English Church represents the New Testament better than the Nicene; but his secession from Rome (which preceded by a long interval his return to Anglicanism) was based mainly on the purely logical ground that he could not see how a conclusion could be more certain than its premises. Surely premises can be verified by finding the conclusion which implies them to be a fact. Protestants as well as Romanists usually assume, and that without any logical inconsistency, that when the truth of a creed is believed (on historical or other grounds) to be morally certain, to live in the spirit of that creed supplies a verifying test which, if the creed be really true, will make the certainty absolute. Little, in fact, is contributed to the intellectual side of the questions between the Churches of England and Rome, or between either and the rationalist spirit of the age. Anglicans may learn something from the account of the recent internal history of the Anglo-Roman body, and members of both Churches from the singularly candid statement of their respective moral advantages: but, after all, Mr. Capes does not teach us anything better worth knowing than Mr. Capes himself.

Mr. Bickersteth has brought out a third and (in spite of a few inadvertences of writer or printer) a stereotyped edition of *Yesterday, To-day, and for Ever*, with a "very grateful sense of the acceptance which this work has found in England and America." Lowell was, therefore, wrong when he said that "nobody likes inspiration and water." Many people like it well enough to read more than 10,000 lines of blank verse, describing a sort of Protestant Gerontius passing through death and judgment (the world's as well as his own), who, when dying, had too good taste to let his children read anything to him but the Bible, but when dead let his guardian angel paraphrase to him the whole Bible narrative, except the last few chapters of the Revelation, whose fulfilment he dies in time to see, and describes himself. It is superfluous to say that in this part he is less picturesque than St. John, and a great deal more voluminous: it is only fair to say that, in describing the Creation and the Fall, the angel reminds one of the more prosaic parts of Milton; and that the work contains one sublime if not original moral conception—that eternity of pain, instead of implying eternity of sin, is an extreme but effectual remedy for it—and one really poetical passage, the beginning of the Fourth Book, on the sacredness of tears.

If English theology of the last generation suffered in value from want of comprehension of the critical spirit, it does not follow that it is unmixed gain that the present generation is widely conscious that a critical spirit is abroad. A clergyman, like Dr. Perowne, of more learning, and perhaps more liberality than ordinary, who finds his well-considered convictions in harmony with the traditional system of his Church, is tempted to assume an amphibious character, and present himself as a critic among divines, and a divine among critics. We really learn nothing from the fact that a good Hebrew scholar feels the obvious moral difficulties in the story of Abraham's sacrifice, and meets them in the obvious way; and not much from the fact that his adherence to the common Christian interpretation of the prophesy in Isaiah viii. and ix. is not shaken by his competence to form an opinion on the doubtful details of the translation; and this is the whole result of the two essays or lectures at the end of the volume.

Of the Sermons, properly so called, nearly half, including all the Lampeter College ones, are sermons like any others, but better than most—earnest, high-minded, the product of a well-informed mind, but meant avowedly to minister to edification, not to impart information. Some of

these are, indeed, anything but commonplace; the fifth is particularly mainly in its denunciation of the pseudo-charity that is afraid to be angry, and the sixth, in its plain-spoken application to the conventional insincerities of life. But of the other sermons, some must be judged by another test than their moral tone, and a test which they will not stand. The university sermon on "Prayer and Natural Law" is nothing if not a contribution to the philosophy of religion, and it is not that. The preacher cannot understand his opponents' point of view, or he would know that the most consistent of them hold the laws of thought and emotion to be as fixed as those of health and weather, so that prayer for spiritual blessings would be as vain as for temporal. And what is worse, he does not understand his own; for surely by the note on p. 261, he does not mean to concede that the only answers to prayer are the subjective effects of the act of worship on the mind of the worshipper; if he does, he of course concedes the whole question. And it may be doubted whether anti-Roman controversy is a useful subject to preach on before a Protestant congregation, though no doubt it is more legitimate in a cathedral than anywhere else. But it seems as if Dr. Perowne, in his anxiety to condemn the Vatican Council, attributed to the first council of Jerusalem too much of the modern liberality and tolerance in which the other was wanting. "Purity of life we hold to be the first thing; questions of ritual we hold to be of no importance whatever" is hardly "the spirit of the decree" which couples as "necessary" the abstinence "from things strangled, and from fornication." And, elsewhere, it is scarcely just to call the distinction between *latría* and *dulia* "hypocritical," while to call it "casuistical" shows simple ignorance of what the word means. In fact, on this subject the preacher's vehemence leads him to quote "language which God himself condemns, like the language of Job's friends, as if it were the voice of inspiration" (compare p. 86 with p. 241).

The title of Canon W. Cooke's little book well describes its object; its method is the not very attractive one of a *catena* of Anglican authorities. He easily proves the point of historical theology, that the English church recognises the ministerial declaration (public or individual) as a means for the penitent receiving the grace of pardon; he says little on the question that really excites the popular mind, whether the faithful are to be counselled to disclose the secrets of their souls to the clergy. He only quotes some remarks of the late Dr. Neale to the effect that the theological question and the common-sense one are different; and his citations (especially that from Evelyn on his daughter's death) seem to prove that English prejudice on the latter was not as strong in the seventeenth century as in the nineteenth. The book was officially commended by the late Bishop of Salisbury: the present edition is enlarged but not materially altered.

Mr. O. Shipley is probably wise in publishing *Studies in Modern Problems* in the form of a series of tracts instead of a volume of essays. Of the three already out, Mr. Ward's, on Sacramental Confession, deals with the side of the subject which Mr. Cooke disregards; he writes like a gentleman, and will seem sensible to those who agree with him. Mr. Pocock is spiteful towards the Swiss Reformers, and attributes to the English too much consistency in what he regards as error. Mr. J. W. Lea should have known that J. M., who wrote the *Doctrine and Discipline of Divorce*, in 1645, was no other than John Milton: doubtless most Englishmen will agree with him in regarding the views of that work as detestable. But there is a proverb against washing your own dirty linen in public: the same objection applies to ducking your enemies in public, when their linen is dirty—or non-existent. WILLIAM HENRY SIMCOX.

The Gospels from a Rabbinical Point of View, showing the perfect Harmony between the Four Evangelists on the Subject of the Lord's Last

* *To Rome and Back*. By the Rev. J. M. CAPES. (Smith, Elder & Co.)

Yesterday, To-day, and For Ever. By the Rev. E. H. BICKERSTETH. Third edition. (Rivingtons.)

Sermons. By J. J. STEWART PEROWNE, D.D. (W. Isbister & Co.)

The Power of the Priesthood in Absolution, and a few Remarks on Confession. By WILLIAM COOKE, M.A., F.S.A., Hon. Canon of Chester. Second edition. (Parker & Co.)

Studies in Modern Problems. Edited by the Rev. ORBY SHIPLEY, M.A. (Henry S. King & Co.) No. 1, "Sacramental Confession." By A. H. WARD, B.A. No. 2, "Abolition of the Thirty-nine Articles." Part I. By NICHOLAS POCOCK, M.A. No. 3, "The Sanctity of Marriage." By J. W. LEA, B.A., F.G.S.

Supper. By the Rev. G. Willdon Pieritz, M.A. (London: Parker & Co., 1873.) The writer, who is a converted Jew, maintains that the Crucifixion synchronised with the slaying of the Paschal Lamb, and that the word "Passover" in certain verses of the synoptists has a mystical sense. On "the principle of our Lord's action" we read that "He came to establish the New Covenant, complete in itself, not to patch up the old, which was passing away. . . . Matt. iii. 15 has reference to no Jewish ordinance, but to Christian Baptism. . . . The Lord, far from going out of his way to imitate a Jewish Passover, would, on the contrary, rather have gone out of his way to avoid all similarity to such an ordinance." The writer has the merit of stating his opinions clearly, but some of them will not pass unchallenged. When he writes that "the Jews now follow an order according to which the first day of a great festival shall never fall on a Saturday at all. . . . in defiance of all astronomy, as well as in disregard of their own Law" (p. 81, 2), he is seemingly at variance with p. 179 of De Sola's *Forms of Prayer according to the custom of the Spanish and Portuguese Jews* (ed. 2, Lond., 1852), from which it appears that the Passover commenced, or should have commenced, on Saturday in each of the years 1853, 1860, 1863, 1866, 1867, 1869, 1870, 1873.

MR. E. H. PALMER'S *History of the Jewish Nation* (Christian Knowledge Society) is likely to be popular among the "Christian families and schools" for whom it is intended. Readers of a more critical turn will perhaps be disappointed, for though the author professes to "treat the history of the Jews entirely from a secular point of view," he has evidently a conscientious objection to criticise the Bible "like any other book." What he has done, and done well, is to show the continuity of the national life of the Jews, and occasionally to enliven the narrative with geographical and archaeological illustrations. The larger half of the book is taken up with a readable account of the post-Biblical and modern history of the Jews, the former of which terms, however, is stretched so as to include the periods of Ezra and Nehemiah, and of the Maccabees.

SIGNOR CASTELLI'S little work, *Il Messia secondo gli Ebrei* (Firenze: Le Monnier) is an historical sketch of the Messianic idea among the Jews. We turned with some curiosity to the Talmudic portion, but regret to say that the absence of dates renders it valueless for critical purposes. It may still, however, be useful as a well-arranged index of passages.

Histoire des Idées Religieuses en Allemagne depuis le Milieu du XVIII^e Siècle jusqu'à nos Jours. Par F. Lichtenberger. 3 tomes. (Paris: Sandoz et Fischbacher.) This is, in fact, a biographical history of German religious literature from the middle of the eighteenth century, the work of an ex-professor of the Academy of Strassburg, who has cast in his lot with France, but professes unabated admiration for the "Germany of yesterday." An Alsatian by birth, the writer cannot pretend to the inimitable grace of a Renan or a Réville, but what he misses in elegance he probably gains in accuracy. He writes, too, for a public which regards religious problems from the practical, unprofessional point of view, which is that of nine out of ten educated Englishmen. Hence his treatment of German philosophy is what a philosophical student would call meagre and unsatisfactory. Indeed, he carries his deference for his public so far as to ignore altogether the Hegelian element in Strauss's first *Leben Jesu*. It is true that orthodox writers are prone to exaggerate the importance of that element, and to think that the collapse of Hegelianism is the condemnation of the myth-theory: all the more reason why M. Lichtenberger should not rush to the opposite extreme of disparagement. The account of Schleiermacher, on the other hand, is written with knowledge and sympathy, and is,

perhaps, the best available introduction to the most fertile and most prominently influential of all the modern theologians.

The features which specially recommend the *Histoire des Idées Religieuses en Allemagne* to general readers, are the stress which it lays on the connexion of theology with culture, and the biographical mode of treatment, while students will equally appreciate the careful and impartial analysis of important books. The chapters on the classical literature in the first, and on German lyric poetry in the second volume, exhibit the chief points in which the leaders of culture come into contact with contemporary theology. As the writer truly remarks, "He who wishes to estimate the transformation effected in Germany in the domain of religion, ought not to limit himself to the study of the works of professed theologians: he ought also to interrogate those in which the inner thoughts and the very soul of the nation are expressed in the most direct and spontaneous manner." From Klopstock to Goethe, from Richter to Heine, the great writers of German literature are one by one led before us, and their chief utterances on religion tenderly but truthfully examined. There is also a chapter on German Catholic theology, from Sailer to Döllinger, which might, however, as well have been omitted, as Catholic theology seems as yet to have contributed no elements of importance to the national culture.

EDITOR.

NOTES AND NEWS.

A WELSH version of the story of the Holy Grail (*Y Saint Gread*), from the unique MS. of the fifteenth century preserved at Peniarth, with an English translation and notes by the Rev. Canon Williams, is now in the press, and the first half-volume is expected to be ready in a few weeks.

A GERMAN poetess resident in Holland, M^{me}. Lina Schneider, has recommended that the Netherlands Government should make overtures for the purchase of the warehouse in Cologne in which Vondel, the greatest of all Dutch poets, is supposed to have been born. The Prussian property thus to be annexed by Holland would be made the repository of a complete Vondelian literature.

SIGNOR EUGENIO MORPURGO has lately published at Venice a short monograph upon paper making, in which he furnishes some curious statistics relative to this important industry. It appears that the United States, with their enormous amount of periodicals and other literary productions, consume more paper than England and France united. They have 3,000 machines, producing annually 200,000 tons of paper, which in a population of 28 millions averages 17 lbs. of paper a head, while a Russian consumes only 1 lb.; a Spaniard, 1½ lb.; an Austrian or Italian, 3½ lbs.; a Frenchman, 7 lbs.; a German, 8 lbs.; and an Englishman, 11½ lbs. There are in the world 3,960 paper manufactories, employing 90,000 men and 180,000 women, besides 100,000 occupied in the rag trade. Of the 1,800 millions of lbs. of paper produced one-half is used in printing, a sixth in writing, and the remaining third in packing.

A LINE or two to recommend an enterprise which deserves the support of historical and theological students. Dr. Bickell, of Münster, is bringing out an *editio princeps* of the works of the eminent theologian and hymn-writer, Isaac of Antioch (4th century), which promise to be full of valuable illustrations of the morals, religion, and history of his times. The Syriac text is accompanied by a Latin translation. Subscribers' names may be sent to Messrs. Williams & Norgate.

It appears from the last Report of the South Australian Institute, at Adelaide, that during the year 1872-73 the large number of 50,000 volumes were circulated among its members. The number of volumes in the library at the annual examination in May was 17,360.

IN the later years of his life, Théophile Gautier's social circle was curiously narrow. All Paris knew him, but it was in street, in café, in exhibition. His intimates were few. Two or three Parnassians, Louis Bouilhet, the poet, Auguste Châtillon, Flaubert, and Ernest Feydeau, were the only habitual frequenters of his villa at Neuilly. M. Feydeau's posthumous work, *Théophile Gautier, Souvenirs Intimes* (Paris: E. Plon et Cie.) is therefore an authoritative production, and should paint the inimitable *conteur*, the *poète impeccable* in his veritable home colours. But the author of *Fanny* did not possess many of the qualities of a faithful biographer. The egregious puerile vanity manifested so obtrusively in all his recent works, renders his *Souvenirs Intimes* a very one-sided and imperfect contribution to literary history. Théophile Gautier is painted by a fanatic. M. Feydeau proclaims himself the sole appreciator of his friend, the chief defender, the sworn apologist and panegyrist. The book is written in a weary, cynical style, seemingly born of a conviction that Gautier was misjudged by all save the one inheritor and representative of French taste, Ernest Feydeau. And apart from this tone of lamentation, the book is a sorrowful one—a history of scepticism grown old and near to death. The last of the collection of anecdotes is painful in the extreme. A few weeks before his death Gautier said suddenly, "Feydeau, have you ever understood what work we came to perform down here?" "I? never a bit. We shall know it perhaps when the knowledge will be useless. I mean when we shall be plucking the flowers by the roots. In that case, whoever is the first to engage in the cheerful operation should inform the other of his experience." "Eh bien, c'est entendu," answered Gautier. Both speakers were then suffering from a mortal malady.

THE efforts of the Khedive to extend to Egypt some of the most prominent results of European culture have already been the means of calling into existence numerous institutions of great importance to the present and future destiny of the people. But these benefits are not limited to the Egyptians, for by the establishment of the Museum of Antiquities at Bulak, material aid has been afforded to the cultivators of Egyptology, while the encouragement and support given to Dr. G. Rohlfs in the prosecution of his expedition into the Libyan desert promise to yield important results in the domains of geographical enquiry. No innovation in the traditional routine of Egyptian home affairs is, however, more significant and more radically subversive of national prejudices than the establishment of the public library, which is at the present moment being organised in the buildings appropriated to the Ministry of Instruction at Cairo. Here are being rapidly collected all the more important works of modern European literature, especially such as have any bearing on Egypt and its history, together with all the more ancient copies of the Koran and other Arabic MSS. of interest that can be secured for the purpose. Amongst the thirty transcripts of the Koran already collected is the celebrated copy, by the learned Gaafar "the truthful," which is referred to the year 720 A.D., and is written in black, red, and gold Coptic characters on gazelle-skins. These MSS. have, for the most part, been abstracted from the mosques and other religious buildings, in defiance of much angry remonstrance from the members of the Ulema; but the Khedive, with stoical indifference to the storm of opposition threatened by the orthodox party in the State, has carried out his purpose, and has, moreover, secured the future efficiency of his measures by placing the newly-established library under the direction of the German *savant*, Dr. Stern, who had accompanied Professor Ebers, of Leipzig, on his last scientific expedition to Egypt.

DR. BEARD'S paper upon "Youth and Age," (read before the Medico-Legal Society of New York) supports a view which would be likely to commend itself to the approval of a young nation. He considers that not only is the period of mental

vigour, generally speaking, commensurate with that of bodily strength, but that the limits of growth, maturity, decline, decay, and senility, admit of being accurately defined in the following way. The brazen decade is from 20 to 30; the golden, from 30 to 40; the silver, from 40 to 50; the iron, from 50 to 60; the tin, from 60 to 70; the wooden, from 70 to 80. Dr. Beard maintains that this scheme holds good both in the case of men of action and men of thought, and that in the golden decade, as a rule, have been produced the masterpieces of philosophy, statesmanship, art, literature, oratory, and all else that evinces mental capacity. Great and original works are the fruit of enthusiasm, and youth and enthusiasm are indissolubly united. Even if Dr. Beard's rule be correct, the exceptions to it are so numerous that the middle-aged and old need not despond, and, with the instances of Bacon, Milton, Cromwell, Brougham and Palmerston, *cum multis aliis*, before our eyes, we are inclined to think that Transatlantic precocity of intellect may often result in premature decay.

It would add an additional horror to an attack of *angina pectoris* to hear it spoken of as *angina*. Yet a correspondent of the *Nation* supports that pronunciation, and states that the only authority in the classical period for the quantity of the second syllable is an extremely rough hexameter of Lucilius:—

"Inspirato abiit quem una angina sustulit hora."

In the third century, A.D., we read in the medical poem of Serenus Sammonicus:—

"Angina uero sibi mixtum sale poscit acetum."

We learn from *Triibner's American and Oriental Literary Record*, that the Library of the Carnavelet Museum of Paris, among its almost unique treasures relating to that city, contains a complete collection of those rare little volumes, twelve in number, published in 1560-88, of Gilles Corrozet's *Antiquitez, Chroniquez et Singularitez de Paris*, etc., of which the National Library itself possesses only seven. Du Boulay's *Historia Universitatis Parisiensis*, 6 vols. folio, published at Paris, 1665-73, a book of extreme rarity, is also to be found on its shelves. It now contains almost every book that has any reference to Paris, none of which, from the most important to the most trifling, can be out of place in such a municipal collection.

MR. W. McMULLEN has printed a second edition of his short *Letter to a Friend* on modern corruptions of Shakespeare's text, showing how many passages have been altered without notice in *Cassell's Illustrated Shakespeare*. Of the instances he quotes, here are three:—

Two Gentlemen of Verona, act i., scene 1.

Sp. If the ground be overcharged, you were best sticke her.—Ed. 1623, p. 21.

Speed. If the ground be overcharged, you were best tetter her.—Cassell's Ed., p. 48.

Ditto, act ii., scene 2.

Launce. . . . This left shoe is my mother . . . it hath the worser sole; this shoe with the hole in it, is my mother; and this my father: a vengeance on 't, &c.—Ed. 1623, p. 25.

Launce. . . . This left shoe is my mother . . . it hath the worser sole. This shoe is my mother, and this my father; a vengeance on 't.—Cassell's Ed., p. 58.

Merry Wives of Windsor, act v., scene 5.

Fal. I thinke the diuell will not haue me damnd. Least the oyle that's in me should set hell on fire; He would neare else crosse me thus.—Ed. 1623, p. 51.

Fal. I think the devil will not have me, lest the oil that's in me should, set his place on fire; he would never else crosse me thus.—Cassell's Ed., p. 129.

Mr. McMullen pertinently asks "If we begin to rewrite Shakespeare, where is the operation to end? In the course of another century the alterations necessary to adapt these plays to prudish tastes will perhaps be twice as numerous; other and bolder editors will arise, and will make still wider havoc; and so on until Shakespeare's text be gradually improved off the face of the earth."

ANENT the abuse of Shakspeare by Greene, in the latter's *Groatsworth of Wit*, Mr. Richard Simpson writes that the following things should be noticed:—

"That Greene, in calling Shakspeare an upstart crow 'beautified with our feathers,' probably did not mean to accuse Shakspeare of stealing, but simply to call him an actor, who had gained applause by spouting the lines of Greene, Marlowe, and Peele."

"The same or a similar phrase is elsewhere used simply with this meaning. In Greene's *Never too Late*, 1590, there is a digression about actors, in which Greene introduces Cicero, saying to Roscius:—

"Why art thou proud with Aesop's crow, being pranked with the glory of others' feathers?"

"In Nash's preface to Greene's *Menaphon* (1589), written evidently under Greene's own superintendence, and partly at his dictation, he talks of play-writers and actors as follows:—

"Sundry other sweet gentlemen I do know [besides Greene and Peele] that have vaunted their pens in private devices, and tricked up a company of taffata fools with their feathers, whose beauty, if our poets had not pecked [decked?] with the supply of their periwigs, they might have anticked it until this time up and down the country with the *King of Fairies*, and dined every day at the pease-porridge ordinary with *Delfragus*."

"Notice, by the way, that these are the two plays mentioned by the actor to Roberto in the *Groatsworth*. Just in this way, when the degree of LL.D. was offered to the young son of the Duke of Suffolk at Cambridge, in Edward VI.'s reign, he said, 'who was he to appear among the doctors, and to plume himself, like Aesop's crow, in alien feathers?'

"Greene then probably did not mean to accuse Shakspeare of theft, but merely to reproach him, a mere actor, an uneducated peasant, with intruding among the authors, who ought to be educated men."

"Perhaps this was not what contemporary readers of Greene's words understood. Chettie, in bearing witness to Shakspeare's honesty, evidently implies that he had been taxed with dishonesty; and R.B., the author of *Greene's Funerals*, says:—

"the men who so eclipsed his fame
Purloined his plumes. Can they deny the same?"

—which looks like a mere paraphrase of Greene's own words. But the object is now only to arrive at Greene's own intention in writing the words; and the quotations given seem to make it more probable that he only intended to tax Shakspeare with being a mere actor, beautified in the assumed plumes of a play-maker.

"And if this was Greene's meaning, what becomes of the whole edifice built on this passage, viz., that up to this time Shakspeare had been a mere adapter of other men's productions; and, notably, that he had stolen Greene's, or Peele's, or Marlowe's *Henry VI.*, and altered it, and called it his own? The quotation of the line—

"A tiger's heart wrapped in a [player's] hide,"

proves absolutely nothing, except that the *Whole Contention* was then existing, and that it was probably Shakspeare's own; otherwise the point of quoting it would not be evident."

THE annual meeting of the Cambrian Archaeological Association will be held this year at Wrexham, North Wales, under the presidency of Sir W. W. Wynn, Bart., M.P. The week has not yet been fixed.

MESSRS. Scribner and Armstrong, of New York, announce that Mr. William Cullen Bryant, assisted by Mr. Sydney Howard Gay, has in preparation a *Popular History of the United States*. The work is to begin with the earliest authentic history of the Western Continent—though not ignoring the earlier mythical period—and to come down to the close of the first century of American Independence. It will require not less than three volumes, and is to be profusely and largely illustrated from original designs.

We have the pleasure of laying before the readers of the ACADEMY a document relating to William Caxton, the first English printer, which, in the

scantiness of our information about him, will, we think, be regarded with interest. Mr. Blades, in his elaborate treatise on the life and works of Caxton, was obliged to regret that his domestic history was almost an entire blank to us, inasmuch that it was a great question even whether he died a bachelor, or had married and brought up children. He left a will which is not now to be found, and we know that he bequeathed fifteen copies of his *Golden Legend* to his own parish church of St. Margaret, Westminster; but whether he was a family man or not, no evidence has yet appeared to show. This question, however, is set at rest by the document which we here subjoin, from which it will be seen that he had a daughter, Elizabeth, married to Gerard Crophe, of Westminster, tailor, and that, in 1496, about five years after her father's death, she and her husband were separated by ecclesiastical authority. It also appears that Caxton had bequeathed to his son-in-law "twenty printed *Legends* at 13s. 4d. a *Legend*," which bequest was confirmed by the judges. The legatee apparently had to pay for his copies, and the price fixed must have been higher than would have been warranted by the laws of supply and demand, unless they were better copies than those bequeathed to the parish church of St. Margaret, which the churchwardens afterwards sold, some at 6s. 8d., and some as low as 5s. 4d., as Mr. Blades informs us.

The document is on paper, and has no seals attached. It is, therefore, not an original, but a copy, which must have been produced in Court in connexion with some law-suit. It was found among the miscellaneous records of the Exchequer, formerly preserved at the Chapter House of Westminster.

"To tharchedeacon of Westminster that nowe is and for the tyme shalbe. We, Richard FitzJames, almoner and counsaillor unto our souverain lord the King, and Richard Hattton, chaplayne and counsaillor unto our said souverain lord, greting in our Lord God everlasting. And where we, the said Richard and Richard, were appoynted, lymytted and assigned by our said souverain lord and the lordes of his most noble counsaill to examine, determine and pacifie a certain variaunce depending betwene Gerard Crophe of Westminster, taillour, of the oone partie, and Elizabeth, the daughter of William Caxton, wif to the said Gerard, of the othre partie; We, the vijth daie of May, the xjth yere of our said souverain lord, had the said parties before us in the Kinges Chapell within his palois of Westminster at this appoyntement and conclusion by theire both assentes and aggrementes:—That noon of them, ne any othre for them, shall fromhensforth vexe, sue or trouble othre for any maner matier or cause them concernyng for matrimony betwix them before had; and every of them to lyve sole from othre, except that the said Gerard shall mowe fynde the meanes to have the love and favour of the said Elizabeth. For thaccomplishment of which aggrement eithre of them of their owne voluntarie willes bound them self unto us by their faithes and trouthes, and never to varie from their said promyses. And therupon the said Gerard to have of the bequest of William Caxton, the fadre of the said Elizabeth, xxth prynted legendes at xijij. iiijd. a legend. And the said Gerard to delyver a generall acquitaunce unto thexecutours of William Caxton, her said fadre, for their discharge in that behalf. And besides thies premisses both the said parties were agreed before us to be bound, othe to othre, in c.li. by their dedes obligatorie with the condicions above wreten to performe alle the premisses. In wittenesse wherof I, the said Richard FitzJames, have to thies presentes sette the seale of myn office, And I, the said Richard Hattton, have setto my seal, and eithre of us subscribed our names with oure owne handes, the xxth daie of May the xjth yere of the reigne of our said Souverain Lord."

Those who are familiar with the history of the Petition of Right will remember the clause reserving the King's sovereign power, which was sent down from the House of Lords and rejected by the Commons. This clause has usually been attributed to Bishop Williams on the authority of Hacket, who says (ii. 78) that—

"The Bishop of Lincoln likewise promoted the petition, but he was a great stickler for an addition that it might come to the King's hands with a mannerly clause, that as they desired to preserve their own liberties, so they had regard to leave entire that power wherewith his Majesty was entrusted for the protection of his people."

That writers of a high reputation should have accepted this statement of Hackett's without further enquiry is a curious instance of the way in which an assertion made by an old writer is taken as unquestionable: for anyone who will take the trouble to read on will find that Hackett introduces a long argument, which he says was delivered by Williams, directed against that very sovereign-power clause which he has just represented him as supporting. And there can be no doubt which of the two assertions is correct, for we have a totally different clause inserted in the *Lords' Journals* as proposed but not carried, in which no mention is made of sovereign power; and we learn, from a paper in the *Harleian MSS.* (6,800, fol. 274), that this was drawn up by Williams. The sovereign-power clause, according to *Elsing's Notes of the Debates* in the House of Lords during this session, was claimed as his own by Weston, though the first draft of it probably proceeded from Arundel.

THE mythological character of the story of William Tell has recently again become the subject of animated discussion in Germany, and Dr. W. Bacher, of Breslau, has written to the *Allgemeine Zeitung* to remind its readers that he had discussed the question as early as 1871, when, in a special paper, published in the *German Magazine for Foreign Literature*, he related the story of the shooting of the apple, as given by the Persian poet, Farid-Uddin-Attâr. An earlier notice, by M. Garcin de Tassy, of this Eastern writer, who flourished at the time of the Crusades, and is believed to have died at the close of the twelfth century, and nearly about the same year as Richard Cœur de Lion, appeared in *Persian* (Paris, 1857), under the title of *Mantic Uttair, ou le Langage des Oiseaux*. In 1863 M. de Tassy brought out a French translation of these curious poetic tales, which were also included in the work, entitled *La Poésie Philosophique et Religieuse chez les Persans d'après le Mantic Uttair* (Paris, 1864). The undoubted authenticity of M. de Tassy's version of the Persian tale, of a father shooting an apple off his son's head at the command of a cruel tyrant, may certainly be regarded as affording a presumption in favour of the mythical character of the Tell exploit, since it may be readily assumed that the story was diffused over Europe by crusaders returning from the East, and might in Switzerland have been readily transmuted into a form harmonising with local conditions and existing historical relations. But if the Tell-myth may be thus disposed of, we have still another historically attested incident of a similar character to consider, which crops up in Scandinavian history at an earlier period, and must be referred to a more ancient source than the tales of the poet Farid-Uddin-Attâr, even if we assume that it had a Persian origin. Saxo Grammaticus, the Danish monk-historian, who died at a great age in 1202, and who, many years before, had compiled a Latin history of Denmark, relates in the tenth book an incident of the shooting of an apple, which in his time was, and had long been, generally accepted as a fact of national history, well known and traditionally preserved among the Danish people. In this tale the scene is laid at the Court, and in the closing years of the reign of King Harald Blaatand, grandfather of our Canute the Great, who ruled over Denmark between the years 935 and 985. The heathen warrior-chieftain Palnatoke, who had incurred the Christian king's anger by encouraging the rebellious schemes of his son Svend (destined long afterwards to conquer and die in England), is the hero of the Danish tale, and like Tell he is made, in expiation of his daring opposition to a tyrannical ruler, to prove his

boasted skill in archery by shooting an apple off the head of his only son. Although the times, scenes, and persons are so different in these stories, the leading facts are identical in the two; for when the king has discovered the arrow remaining in the quiver after the successful shot has been achieved, and asks for what purpose it is there, he receives the same answer that Tell gave to Gessler; and when he orders the arrest of the daring archer, sympathising friends are able to aid his escape, while, moreover, the exasperated father lives long enough to prove the most dangerous of all the tyrant's foes, and ultimately to compass his ruin and inflict upon him his death-blow. The identity of these incidents in the Palnatoke and Tell myths undoubtedly points to one common source of folklore for both, and it would be an interesting problem to try and trace them back to their origin, and see whether they may not be followed to some fountain-head open to all the peoples of Aryan descent before their separation and migration from their Eastern homes.

MR. THOMS, who has done so much to dispel our dreams as to the longevity of mankind, has not, we believe, directed his attention to a wonderful case of the kind mentioned in Nichols' *History of Leicestershire*, vol. iii. p. 473. It is in the pedigree of the Digby family, and we are there gravely told that Everard Digby, of Drystoke, father of the gunpowder conspirator, Sir Everard Digby, married Mary, daughter of Francis Nele, of Reythorpe, born 1513, living 1634. It may be only a misprint, but it is high time, if it be so, that it should be set right, or we shall have Mary Digby appearing in a hundred popular books as the old lady who lived to upwards of 121 years of age, with a multitude of authentic anecdotes concerning her that will rival in interest those which everybody except Mr. Thoms and his sceptical following believes about the old Countess of Desmond.

NOTES OF TRAVEL.

WE know not whether our readers may not feel more regret than satisfaction on learning that the charming region of the Bernese Oberland is to be levelled and tunnelled in every direction to make way for a network of railways, which, thanks to the success of the Rigi line, are now to penetrate to the ledge of every waterfall, ice grotto, and glacier. At Grindelwald a central station is to be brought within the precincts of the Schwarzer Adler, close enough to the glacier, we hear, for the smoke and steam to blacken and melt its icy waves. The guides to Lauterbrunnen and the Wengern-Alp will soon be an extinct race. Tourists will no longer have to hire horses and mules to convey them along paths, where, as they soon learned by experience, their own feet generally had to carry them the greater part of the way. All that is past. A railway will soon enable the flying tourist to pass through the Ober-Bernland in a day, and to look down from a first-class carriage on the panorama seen from the Scheidegg, which is to be the culminating point of the lines.

OFFICIAL accounts from Rhodes tell us that the diving apparatus used for the sponge fishery, the principal branch of industry there, are exclusively imported from Great Britain and France. In 1870 those of English manufacture were unjustly taxed, the cost of a licence to fish with them being 15*l.* in excess of what was charged for the use of the French apparatus. Redress of this grievance was obtained through our Embassy at Constantinople. Though there is no difference in construction between English and French machines, with regard to the depth they can attain, or the length of time a diver can remain under water, still English produce generally proves stronger. The air-tubes are heavier than the French, and thus impede the free movements of the diver, by the tubes being caught on rocks; the floating tubes, however, which are coming into use, will get rid of that difficulty. The yearly average crop of sponges

may be estimated at 120,000*l.*, of which about 50,000*l.* are sent to England. The value of them is rapidly diminishing, owing to the more abundant crops which the introduction of these apparatus enables the divers to gather. This fact, together with the increasing taxes imposed on these fisheries, will, it is anticipated, gradually restrict this industry, and cause the divers to seek a more remunerative and less dangerous work.

HALF-A-MILLION Circassians have, within the last few years, left Russian soil, and it is stated that a great number more are preparing to emigrate into Turkey in the coming spring. The chief causes of this new exodus are two:—the dissatisfaction of the Circassians with the size of their holdings, the property of former emigrants having been distributed among the Russian officers; and the influence of the priests, who are bitterly hostile to Russia. The Turkish Government intends to give these emigrants certain parts of the plains of Thessaly—to the horror of the Greeks, who fear a revival of marauding and brigandage, and pertinently ask whether the Circassians will work when they can steal? It is said that Tartar families would make infinitely better colonists.

FOR the third year in succession, the peasants of Persia are able to rejoice in a plenteous downfall of rain. The moisture-bearing clouds, which have passed unhappy Bengal, seem to have discharged their burden upon Iran. As late as last week, a time when spring has generally begun, the whole country was under eighteen inches of snow. Nature is compensating herself for the seven years of more or less complete drought which preceded the famine.

THE latest official account of the Straits Settlements situate at the head of those Straits of Malacca, of which we have all heard so much lately, should have special interest just now. It was drawn up last year for the Colonial Office by Lieut.-Governor George W. R. Campbell, but has only recently been laid before Parliament. The settlements consist of the island of Penang, fourteen miles long by eight miles broad, which lies three miles off the mainland of the Malay peninsula, and of a long strip of that peninsula itself, lying opposite the island, and called Province Wellesley. The climate is hot, but very healthy, and the scenery is beautiful—not unlike that of the western Highlands of Scotland, though with softer features. Some idea of the relative importance of the Settlement may be given by saying that it has a greater area than most of the West Indian colonies; a much greater population than any of them, except Jamaica; a far denser population than any of them, except Barbadoes; and that its imports and exports for 1872 were nearly equal to those of all the West Indian colonies put together. Sugar, rice and cocoa-nuts are produced there in abundance, and a great variety of delicious fruits. Its chief importance, however, arises from the fact that the capital of the island, "George Town," or "Penang," is a great emporium for the manufactures of Britain, and for the products of the Malay peninsula on the one hand, and of Sumatra on the other. This capital has about 60,000 inhabitants, of whom a very large proportion are Chinese—many of them merchants and shopkeepers. It is situated on a low plain stretching out in a point into the sea, on the side of the island next to the mainland, and its harbour, which is simply the almost land-locked strait between the island and the mainland, is of great extent and of unrivalled calmness. It has always a large fleet of vessels of every rig, from the finest British steamer to the Chinese junk. The population of the Settlement is rapidly increasing, and may amount now to 160,000 persons of well-advanced civilisation. In 1870, when the population was certainly 20 per cent. less than it is now, it numbered 433 Europeans and Americans, 70,464 Malays, 36,561 Chinese, 9,166 Hindoos, and 6,823 Klings. This last peculiar, but thoroughly adopted, name is

given to all persons who have come, or whose ancestors have come, from the eastern (or Coromandel) coast of India; the language of that country is Telugu, Telingu, or Telinga, and its people are hence called Telingas, corrupted by the Malays into Klingas, or Klings. The remaining population were Eurasians, Bengalees, Javanese, and native half-breeds, with a few Siamese, Arabs, Singhalese, Armenians, and Jews. The chief sources of the revenue are the rents of the opium, spirit, bhang, toddy, arrack and pawnbroking farms; the rent and price of land; judicial, commercial and post-office stamps; judicial fines and fees; port and harbour dues and municipal taxes. Of the farms, that for the sale of opium is considerably the largest, thanks to the Chinese population.

"To these people," writes Governor Campbell, "the drug is an inestimable luxury, and, in my opinion, by no means a pernicious one. Cases of extreme indulgence must be rare, for I have never seen them. To the energetic, hard-working, muscular Chinaman, his modicum of opium is but a pleasant sedative, no more to him than is his pipe of strong tobacco to an English peasant. Not for one moment can the evils of the use of opium here be compared with the evils of the use of strong drink in Europe."

A fear seems to have arisen in India a few years back that the Coolies were ill-treated here—the men physically and the women morally—and the tide of Coolies, which for a long time had flowed regularly from the Coromandel coast, was suddenly checked. Some inquiry having shown, however, that the fancied ill-usage did not exist, the restrictions were removed pending legislation on the subject, and the settlement received 3,256 Indian Coolies during the year 1872.

These settlements are blessed with a very unpleasant neighbour in the shape of the kingdom of Perak, a short distance south of them, which has been in a state of anarchy for two years past. The rich tins there, which form the main revenue of the Chief of Laroot, the northern district of this kingdom, who is called the Toonku Muntri, are worked entirely by Chinamen, of whom there are between thirty and forty thousand. Some two years ago these Chinamen had a quarrel and a fight, which grew from bad to worse, until at length the majority of them formed themselves into two great factions, which have gone on fighting ever since, and have repeatedly made the neighbourhood of the mines a scene of horrible carnage. Sometimes one faction gains the upper hand, and drives the other out of the country, taking possession of their valuable mines and works. The faction driven out gets reinforcements of men and arms, renews the struggle, and in its turn becomes victorious; and so the game goes on, without, so far, any appearance of coming to an end.

We hear from Persia by telegraph, that the Shah has abandoned his projected trip to Meshed, proposing instead a journey to Isfahair and Bushire in the autumn. This resolve may possibly be connected with the refusal of his Persian Majesty to co-operate with Russia in an expedition against the Turkomans of Merv, at which, as the *Morning Post* tells us, St. Petersburg journals are so indignant.

THE *Further Papers relating to the Ashantee Invasion*, which have just been issued officially, contain little that has not already found its way into the newspapers, and only needs notice here from containing a valuable "Map of Gold Coast and Ashanti," enlarged from Arrow-smith's latest published edition of *Routes and Mountains*, &c., by Lieut.-Col. de Ruignés, from his own observations on the coast. In a note attached to this map, Colonel de Ruignés writes: "These fertile countries are shut to all explorers by the King of Ashanti. They are reported to have very rich gold fields, and the people to have large flocks and herds of cattle, also camels."

THE *Waimar Gazette* states on authority that

the Grand Duke is in receipt of a letter from Dr. Rohlf, dated February 5, in which the learned traveller announces that he has been able to secure a large number of admirably finished photographs of the magnificent rocky scenery of the Oasis of Dachel, in the Libyan desert, and that he has, moreover, made an interesting discovery of several ancient tombs. In one of these, seven dead bodies were found covered over with a single mat. Dr. Rohlf has removed one of the mummies, together with a mat, a wooden image, and some urns, with the view of bringing them to Germany, if the consent of the Khedive can be obtained; and in the meanwhile they have been deposited, with other objects of interest, in a house at Gasr, the chief station of Dachel. The native servants assert that the recent rains must have destroyed the entire settlement, and as the houses at Gasr are built of clay, hardened in the sun, it is not improbable that long continued wet may have had a destructive effect upon them.

FROM private advices received by last mail from Zanzibar, we learn that, as might have been expected, the long delay, occasioned at home by the successive prorogations of Parliament, in taking any decisive or more extended measures for the enforcement of the Anti-Slavery Treaty lately signed by the Sultan, has encouraged a partial renewal of the slave trade, which, it cannot be too often repeated, has only been scotched, and not killed. It appears that the Arabs are now transporting slaves by the land route along the coast, and again fitting out caravans for the purpose of slave hunting in the interior, hoping, without doubt, that they may find means and opportunity for shipping them from one or other of the ports along the coast. A missionary who had met caravans of slaves on the mainland, and had stopped to question one of the slaves, had been shot in the head by the Arab slave dealer, and his life was in danger. Captain Elton, who had been despatched by Dr. Kirk, previously to the latter's departure from Zanzibar, on an overland journey of inspection from Dar-es-Salaam to Kilwa, had been menaced on two or three occasions by leaders of slave caravans, and had himself counted no less than 4,000 slaves proceeding in one month on their way northwards. And, lastly, a dhow had been captured with 100 slaves on board, but she did not surrender before she had fired upon the men-of-war's boats attacking her, and had lost one or more of her own crew.

These incidents are very significant, for it is not difficult to discover the reasons of this renewed vitality in the trade, and of this active and daring hostility on the part of the Arabs. Immediately after the signing of the treaty, the measures taken by Dr. Kirk, coupled with the extraordinary activity and watchfulness of our small squadron on the coast, were so effectual that the Arab slave dealers were fairly frightened into believing that the game was really at an end, and that these initiative measures could but be the forerunners of other and still more severe repressive proceedings. Last year there were but 1,000 slaves exported northwards, against 20,000 the preceding year, and of these 1,000 no fewer than 217 were captured by the Sultan, who has done, and is still doing, his duty most loyally. But the Arabs have begun to notice that we have in no way followed up our first vigorous policy: the constant boat service on the coast, than which nothing is more trying, has greatly exhausted the energies of the crews, who did such good service last year, and slaving Arabs have again plucked up courage, and commenced to run slaves. It may be anticipated that the subject will receive immediate attention at the hands of the new Parliament, and that steps will be taken to carry out the recommendations of Sir Bartle Frere. If this is not done, all our work will have to be commenced *de novo*, and the 105,000Z. already spent by the late Government in preparing ships for this service become money lost. It should never be forgotten that the treaty is valueless unless we ourselves see that its provisions

are carried out. It must still take years before the slave trade can be entirely abolished, and reckoned absolutely among the abuses of the past. In the meantime the trade of Zanzibar is rapidly increasing, and new sources of revenue being discovered. A concession in favour of a German mercantile house to work the guano on three islands south of Zanzibar has been signed, and this is only one of the first effects of the new stimulus given to trade.

CONSUL MUNRO's latest report to the Foreign Office from Uruguay, which has just been made public, says that the most notable increase in the consumption there of British productions is in the hardware and manufactured iron trade, to which a very great extension has been given in the last seven years in the rapid enlargement of the city and its suburbs, and the planting, progress, and completion of railways, tramways, gas-works, docks, and water-works, the last-named conveying the supply of water for the capital a distance of over forty miles in iron pipes, with corresponding reservoirs, and huge machinery. All this iron-work, machinery, rolling stock of railways, tramways, gas-works, and water-works are English, as well as the iron-work in the construction of houses and stores, as also of two commodious iron-built market-places. From the geographical position of this country, however, between two other powerful states, its liability to become a theatre of war is almost as strongly opposed to the development of its resources and the improvement of its trade, as is the latter encouraged and invited by its superior ports and fluvial advantages.

THE Commandant of the French establishment in Oceania has addressed a report to the Minister of Marine, dated Papeete, November 6 last. In the island of Anna, where the native houses and streets are chiefly of coral, stone buildings, magazines, schools, wharves and jetties have been provided. This island is, after Tahiti, the most civilised, productive, and commercial of the Protectorate. Roads are being formed which will open up the eastern part of Tahiti, hitherto somewhat inaccessible. The French rule is popular; the cultivation of cotton and cattle-breeding are being developed, the houses of the natives are improving, and land is increasing in value. The trade of Papeete is considerable, but is chiefly in the hands of foreigners.

ALTHOUGH one knows how imperfect all statistics are when they pass certain lines of generalisation, there is always a charm in them which it is difficult to resist. We take the following statement from Siegwart's *Alter des Menschengeschlechts*: The earth is inhabited by 1,381,000,000 human beings. These are divided, according to race, as follows:—

Caucasian race.	380,000,000
Mongolian race.	580,000,000
Ethiopian race.	200,000,000
Malay race.	220,000,000
Redskins.	1,000,000
	1,381,000,000

The rate of mortality is 33,333,333 every year; 91,954 every day; 3,730 every hour; 60 every minute; 1 every second.

The average duration of life is 33 years. One fourth part of the population dies before the 7th year; one-half before the 17th. Only 1 in 10,000 reaches the 100th; only 1 in 500 the 65th year.

Married people live longer than unmarried ones, tall persons longer than short ones.

Only 65 persons in 1,000 contract marriage.

Only the eighth part of the male population is fit to bear arms.

One hundred years ago France was the most populous empire in Europe. At that time

Russia had 17 millions of inhabitants

Austria " 18 " "

Germany " 15 " "

France " 24 " "

Now the population of Russia is 74 millions; of

Germany, 41 millions; of Austria and Hungary, 36 millions; of France, 36 millions; and of Great Britain and Ireland, 32 millions.
